III. For the Literature

1. The following authors' names, when unaccompanied by the title of a book, stand for the works in the list below.

- Baethgen = Beitrag zur sem. Religiongesch., 1888.
- Baldwin = Dict. of Philosophy and Psychology, tr., 1891-1905.
- Benzerus = Heb. Archäologie, 1894.
- Darenberg-Saglio = Historische Archiv, 1886-90.
- Delaunay = Lehrbuch der Religionsev., 1905.
- Deussen = Die Philosophie der Upanishads, 1899 [Eng. tr., 1906].
- Doughty = Arabia Deserta, 2 vols. 1888.
- Hamburger = Realencyclopadie für Bibel u. Talmud, i. 1870 (1892), ii. 1883, suppl. 1886, 1891 f., 1897.
- Holder = Allgemeine Sprachkunde, 1891 ff.
- Howitt = Native Tribes of S. E. Australia, 1904.
- Jubbawin = Cours de Litt. celtique, i.-xii., 1893 ff.
- Lagrange = Etudes sur les religions sémitiques, 1894.
- Lane = An Arabic-English Dictionary, 1863 ff.
- Lepsius = Denkmäler aus Ägypten u. Äthiopien, 1849-1860.
- Lichtenberger = Encyc. des sciences religieuses, 1876.
- Liddell & Scott = Handbuch der nordsem. Epigraphik, 1898.
- Moir = Sanskrit Texts, 1859-1872.
- Mues-Arnolt = A Concise Dict. of the Assyrian Language, 1894 ff.
- Panly-Wissow = Realencycl. der classischen Altertumswissenschaft, 1893-1895.
- Pfeiffer = Römische Mythologie, 1888.
- Réville = Religion des peuples non-civilisés, 1883.
- Riehm = Handworterbuch d. bibl. Altertums, 1893-1894.
- Robinson = Biblical Researches in Palestine, 1856.
- Roscher = Lex. d. gr. u. röm. Mythologie, 1884.
- Schirer = GJV, 5 vols. 1898-1901 [HJT, 5 vols. 1890 ff.]
- Schwab = Leben nach dem Tode, 1892.
- Siegfried-States = Hb. Worterbuch zum AT, 1893.
- Smend = Lehrbuch der alttest. Religionsev., 1899.
- Smith (G. A.) = Historical Geography of the Holy Land, 1896.
- Smith (W. R.) = Religion of the Semites, 1894.
- Spencer (H.) = Principles of Sociology, 1895-1896.
- Spencer-Gillen = Native Tribes of Central Australia, 1899.
- Spencer-Gillen = Native Tribes of Central Australia, 1904.
- Swete = The OT in Greek, 3 vols. 1893 ff.
- Tylor (E. B.) = Primitive Culture, 1891 [1900].
- Weber = Jüdische Theologie auf Grund des Talmud u. verwandten Schriften, 1897.
- Wiedemann = Die Religion der alten Ägypter, 1890 (Eng. tr., revised, Religion of the Anc. Egyptians, 1897).
- Wilkinson = Manners and Customs of the Ancient Egyptians, 3 vols. 1878.
- Zunz = Die gottesdienstlichen Vorträge der Juden, 1892.

2. Periodicals, Dictionaries, Encyclopedias, and other standard works frequently cited.

- AAG = Archiv für Anthropologie.
- AAOJ = American Antiquarian and Oriental Journal.
- AE = Archiv für Ethnographie.
- AGPh = Archiv für Geschichte der Philosophie.
- AHIR = American Historical Review.
- AHT = Ancient Hebrew Tradition (Hommel).
- AJPh = American Journal of Philosophy.
- AJP = American Journal of Psychology.
- AJRPE = American Journal of Religious Psychology and Education.
- AJSL = American Journal of Semitic Languages and Literature.
- AJTh = American Journal of Theology.
- AMG = Annales du Musée Guimet.
- APE = American Palestine Exploration Society.
- APF = Archiv für Papyrusforschung.
- AR = Anthropological Review.
- ARW = Archiv für Religionswissenschaft.
- AS = Acta Sanctorum (Rollandus).

- AEG = Archiv für Ethnographie.
- AASG = Abhandlungen der Sächsischen Gesellschaft der Wissenschaften.
- ASoC = L’Année Sociologique.
- AAWT = Archæological Survey of W. India.
- AZ = Allgemeine Zeitung.
- BC = Bulletin de Correspondence hellénique.
- BE = Bureau of Ethnology.
- BG = Bombay Gazetteer.
- BJ = Bellum Judææ (Josephus).
- BL = Bampton Lectures.
- BLE = Bulletin de littérature Ecclésiastique.
- BOR = Bab. and Oriental Record.
- BS = Bibliotheca Sacra.
- BSA = Annual of the British School at Athens.
- BSAI = Bulletin de la Soc. archéologique à Alexandrie.
- BSG = Bulletin de la Soc. des Géographes.
- BTS = Buddhist Text Society.
- BW = Biblical World.
- BZ = Biblische Zeitschrift.

[A small superior number designates the particular edition of the work referred to, as KAT², LOT¹, etc.]
DRAVIDIANS (North India).—1. Meaning of term.—The term 'Dravidian' (Skr. Dravida, the adjectival form of Dravida) seems to have been primarily an equivalent for 'Tamil,' but was extended by Caldwell (Dravidian Grammar, 4 ff.) to denote the family of languages formerly designated Tamulian or Tamilic, practically including all the languages of Southern India—Tamil, Telugu, Malayalam, Canarese, and Tula—which form a group well defined and closely related to another. Manu (Institutes, x. 43, 44) speaks of the Dravidas as a tribe of Ksatryyas, or warriors, who had become out-castes and, as they are the only southern tribe mentioned in his lists, Caldwell supposed that in ancient times the name was loosely applied to the whole of the South Indian peoples. Whether or not this belief was well founded, his invention of the word 'Dravidian' as a generic term for the South Indian group of languages is convenient, and has been generally accepted. By a natural, if not perfectly justifiable, extension the term, primarily philological, has been widely used in an ethnological sense, and we have become accustomed to speak of the Dravidian peoples when we really mean the races speaking the Dravidian languages. Even in this slightly extended sense the term 'Dravidian' is fairly exact and little open to misunderstanding. Risley, however, in his report on the last Census of India (1890), has used the term in a much wider sense. He includes in it races 'extending from Ceylon to the valley of the Ganges, and pervading the whole of Madras, Hyderabad, the Central Provinces, most of Central India, and Chota Nagpurs'; and he regards this as 'probably the original type of the population of India, now modified to a varying extent by the admixture of Aryan, Scythian, and Mongolid elements.' Nearly all the other existing races of India, except the Indo-Aryans, such as the Rajputs, Jats, and Khatris of the Panjab, are classed by him as Scytho-Dravidians, Aryan-Dravidians, or Mongolo-Dravidians. In other words, every element in the present population which cannot be classed as Aryan, Scythian, or Mongolid, is designated 'Dravidian.' This terminology is, as Risley himself is aware, open to much criticism. Like 'Aryan,' 'Dravidian,' originally a purely philological term, is wanting in precision when used in an ethnological sense. But the name, however unsatisfactory it may be, has now passed into popular use, and the writer of the present article is unable to suggest a better alternative. Here it is taken to denote that form of Animism which constitutes the belief of a body of forest tribes occupying the line of hills which forms the backbone of the Peninsula, extending from the Indian Ocean into the lower course of the Ganges. Analogous forms of belief are found among the agricultural, artisan, and monial population of the great northern Plains, and along the lower slopes of the Himalaya. Beliefs and practices of this type form the basis of popular Hinduism as we now observe it. In fact, no clear line of distinction can be drawn between these forms of Animism and much of what is known as orthodox Hinduism. Both have been in contact for an enormous period of time, and each has reacted on the other. Hinduism admitting many of the Animistic beliefs and rites of the darker races, while these in their turn have largely accepted the outward observances of the Hindu faith, worshipping the Hindu gods, who are often only modifications of their own deities, and adopting the rules of caste and the social restrictions concerning food and personal purity which caste enforces.

2. Primitive Dravidian religion.—An attempt has been made by Caldwell in Southern India to investigate on the basis of philology the primitive Dravidian beliefs. 'They were,' he says (op. cit. 118), 'without hereditary "priests" and "idols," and appear to have had no idea of "heaven" or "hell," of the "soul" or "sin;" but they acknowledged the existence of God, whom they styled Kali, or king—a realistic title little known to orthodox Hindism. They erected to his honour a "temple," which they called Koili, "God's house;" but I cannot find any trace of the "worship" which they offered to him.' In another passage (ib. 550 ff.) he compares the demonology of the Dravidians with the shamanism of High Asia, noting as features of resemblance the absence of a regular priesthood; the acknowledgment of God's existence, combined with neglect of His worship; the non-existence of belief in metempsychosis; the objects of worship being not gods or heroes, but demons, which are supposed to be crnel, revengeful, and capricious, and are worshipped with blood sacrifices and wild dances.
The officiating magician or priest excites himself to frenzy, and then, as if possessed by the demon to which worship is being offered; and whilst in this state he communicates to those who consult him the information he has received. The demonology practised in India by the more primitive Dravidian tribes is not only similar to this, but these tribal demonologies, in their external form and in the manner in which they are performed, resemble the Shamanic worship would apply equally to the Dravidian demonology; and in depicting the ceremonies of the one race, the author has attempted to depict the other also.

It must, however, be remarked that the belief in demoniacal possession, unless Caldwell uses the term in its technical sense, is found among the Northern Dravidians.

3. Shamanism.—Thus, according to Caldwell, the basis of the beliefs of the South Indian Dravidian tribes is shamanism, and many instances of similar customs are quoted among those of the North; e.g. the Kuru or Mu'assas of Chotā Nagpur communicate with the evil spirit which they worship through their priest, the bājji. He assembles the people, music and dancing commence, and an invocation of the spirit is chanted—

"until one or more of the performers manifest possession by rolling of the eyes and involuntary spasmodic action of the limbs. The affection appears contagious, and old women and others who have not been dancing become influenced by it in a moment. This, perhaps, is the most thorough form of demon worship with which we are acquainted, and its votaries to keep up to its own reality each time it was resorted to (Dallston, 223.)"

Similar practices employed for the exorcism of diseases are widely spread among the people of the northern Plains. But even among the tribes which occupy the central region of hills this form of shamanistic orgies seems never to have taken the same hold among the people as has been the case in Southern India, where what is known as Devil Worship may be observed much more frequently than in the north. This has been described among the Shānāras of Tinnevelly by Caldwell (op. cit. 585 f.) and by Burrell ("The Devil Worship of the Tulas," 1894); and in Northern India, at least, shamanism has played a quite unimportant part in the development of the popular beliefs.

4. Animism.—The religion of the Northern Dravidians is mainly a form of Animism, defined by Tylor, who invented the term, as "the belief in Spiritual Beings" (Prim. Cult., 2, 1901, i. 424); or as Jevons (Intro. to Hist. of Rel., 1896, p. 22) defines it: "All the many movements and changes which are observable today taking place in the world of things, were explained by primitive man on the theory that every object which had activity enough to affect him in any way was animated by a life and will like his own."

The term has been used by some authors to cover the various manifestations of what is commonly but cumbersomely styled the "anthropomorphic" tendency of savage thought. (Marrett, Thrsh. of Rel., 1900, p. 6); and the same author (ib. 11) urges that what he calls "Super-naturalism" is "not only logically, but also, in some sense, chronologically prior to Animism." Following the same line of argument, Risley ( Census Report, 1901, i. 202), while accepting the title "Animism" for the vague, amorphous conception which he is discussing, endeavours to ascertain the ideas which underlie it:

"In many of the religious works and seeks by all means to influence and conciliate is the shifting and shadowy company of unknown powers or influences making for evil rather than for good, which resides in the primeval forest, in the crumbling hills, in the rushing river, in the spreading tree, which gives its name to the thing which is denounced to the snake, which generates jungle fever, and walks abroad in the various guises of cholera, smallpox, or murrain. Closer to this he does not seek to define; he knows only that he which he offers him, or whose symbol he daub with vermillion at the appointed season. Some sort of person is behind that is enough for him. Whether it is associated with a spirit or an ancestor, or an ancestor, whether it proceeds from the mysterious thing itself, whether it is one power or several, or is not stop to inquire."

And he goes on to say that—

"the hypothesis that the earliest beginnings of savage religion are to be sought in the worship of the demon to which worship is being offered; and whilst in this state he communicates to those who consult him the information he has received. The demonology practised in India by the more primitive Dravidian tribes is not only similar to this, but these tribal demonologies, in their external form and in the manner in which they are performed, resemble the Shamanic worship of the Tartars. The latter worship Supreme beings who figure in savage mythology almost, and the priest and priestesses of the earlier tribes, in somewhat appropriate attributes. The former become departmental spirits or gods, with shrines and temples of their own and incessant offerings from appeasing votaries. The latter receive sparing and infrequent worship, but are recognized, as oracles, as presiding beings of a higher type than the wishes of mankind, patrons of primitive ethics, makers of things, who have done their work and earned their repose."

From another point of view, dealing with the case of persons gifted with the hereditary powers of healing, Rose (i. 161) shows that—

"As primitive religions have no conception of the distinction between the sacred and the profane, they are supposed to receive their power from their standpoint, that, precisely as physical life is transmitted, so to the soul transmitted to the soul transmitted to another, and with the life transmigrate, as it were, all the attributes and powers of the progenitor. On this theory it is quite easy to explain the trance which is caused by the curing disease or causing evil by means which we may call supernatual."

Animism, as we observe it in Northern India, develops on various lines, according to the diverse objects which are supposed to be occupied and dominated by spirit agency. It will be convenient to begin with the worship of the celestial bodies, though, as a matter of fact, this type of worship is probably later than the cult of tree-spirits or of the village gods. It is in an advanced stage of religious belief, says Robertson Smith (Rel. Sem., 1894, p. 114), that celestial gods predominate.

6. Sun-worship.—Sun-worship prevails widely among the forest tribes of the Central Hills. When they are in trouble, the Khurkārs appeal to the sun; to open space on which he alone serves as an altar. When a sacrifice is needed, the Khinsārs offer a white cock to him, according to the laws of mimetic magic. The Bhūytās and Orions worship him as Bhārām or Dharā Devatā. The Khurkārs reverence him as Bhagāwān, 'the wonderful, the divine one'— a term borrowed from the Hindus; his service is done in an open space, where an ant-hill is used as the altar. The Khurkārs adore him under the name of Bero.

'Every head of a family should during his lifetime make not less than five sacrifices to this deity—the first of cows, the second of a pig, the third of a white goat, the fourth of a ram,
and the fifth of a buffalo. He is then considered sufficiently propitiated for that generation, and regarded as an ungrateful god if he is not thus handsomely to his kin.

Worship of a similar kind is done by the Kols and Orasões (gg.7.) (Dalton, 130, 132, 133, 141, 157, 159, 180, 223). The Davars, a forest tribe in the Thana district on the west coast, worship the Sun at 157). the moon, and the stars, the headman providing rice, meat, water, and other provender for the occasion, and the chief of the tribe making an offering of rice to his god. Among the village populations of the Plains this non-Aryan worship of the Sun has been combined with the Aryan cult of Surya or Sūrāj Narayan.

7. Moon-worship.—Moon-worship, though probably earlier in origin than that of the Sun, is much less important. The Binjūs of Chota Nagpur worship Nind-bonga as the Moon, in conjunction with Sing-bonga, or the Sun. In some other cases the worship of both luminaries is combined, as with the Chandar of the Mundas, known also as Chando Omol or Chanals, who are worshipping two goddesses, the wife of Sing-bonga, the Sun-god, and mother of the stars (Risley, Tribes and Caste, i. 136, ii. 103 f.; Dalton, 186). The most curious form is the Chauk Chandals rite in Bihār. On that day the people fast and perform a Brahman to worship the Moon with an offering of flowers and sweetsmeats. It is believed that, if any one looks upon the Moon that day, calamity will befall him. Should any one be unlucky enough to do this, he will repel the dangerous influences by getting himself abused by other people; abuse, like mock fights, being regarded as a means of protection against demons (Frazer, GB 2 III. 98 f.). He therefore, in order to excite their abuse, flings stones on the roofs of his neighbours' houses (NINQ v. 23 f.).

8. Planet-worship.—The worship of the other planets is of much less importance. Their motions are observed chiefly by astrologers, who calculate the horoscopes of children, and examine the figures with a view to determining whether a marriage will or will not be auspicious. Eclipses are supposed to be the work of spirit agency embodied in the demon Rāhu, who can be scared away by noise, while the suffering Sun or Moon can be restored to vitality by sacrifice and fasting during the period of the eclipse (see OMS 615).

9. The spirits of water.—According to the theory of Animism, the flow of water in river, stream, or well is considered to be due to spirit action, and floods and whirlpools are the work of a malignant spirit. In the Panjāb, when a village is menaced by floods, the headman makes an offering of a coco-nut (which is probably a form of commendation of an original human sacrifice) and a rupee to the flood-demon. He holds the offering in his hand, and stands in the water until the flood rises high enough to wash it away. Then it is believed that the waters will abate. Some offer an animal victim, a buffalo, horse, or ram, which, after being has been drawn from its car as a sign that the offering has been made, is flung into the water (NINQ i. 5). At a whirlpool on the Tapri river the Gonds sacrifice a goat before daring to cross the stream (India Gazet. 1870, p. 35). This propitiation of the water-spirit develops in two directions—first, into the worship of rivers held specially sacred, like the Ganges and Nerbādā, on whose banks, when the summer baths, he enters into communion with the spirit of the stream. As his body is cleansed, so his soul is relieved from pollution. His idea of purification is not spiritual in our sense of the word—that is foreign to primi-

tive habits of thought—but spiritual in the sense of getting rid of evil spirits and their dangerous influence. In the second place, the vague spiritual entity which animates the waters rises into one or other of a host of water-goddesses, like Kājā Khír or Ír Bhadrā, who are worshipped by fishermen and boatmen whose business is on the water. They often make a great show of the worship. Some have underground connexion with a holy river; others are appropriated to the cult of some special god; others are oracular. Hot springs, in particular, indicate the presence of the fire-spirit; of a demon which, if not propitiated, brings disease; of a Rākṣasa or demon slain by a goddess whose blood keeps the water warm (Waddell, Among the Himalayans, 223; BG xiv. 375).

In the same way the fall of rain is due to spirit agency which, if not conciliated, causes drought. The curious nudity rite, by which women endeavour to repel the evil influence by dragging a plough through the soil—a good instance of mimetic magic—is familiar (Crooke, PR i. 60; Frezer, GB y. 189). 10. Wind-spirits.—On the same principle the spirit which causes wind is personified in the Panjāb as Sendā Bir, the whistling god, whose voice announces the approach of the wind. It has now been adopted into Hinduism as an incarnation of Śiva, and is regarded as a malignant deity, causing madness, and burning houses, stealing crops, and otherwise immoral (Rose, i. 139). When a whirlwind comes, the Gūsta women in Mirzapur hold the house thatch, and stick an iron or wooden spoon into it as a charm against the demon; if a man were to touch it, the storm would sweep the roof away (NINQ 183). In the Panjāb, Phūrā, the defied saint who rides on the little whirlwinds which blow in the hot weather, and an appeal to him protects the worshiper from harm (Crooke, PR i. 51).

11. The hail-demon.—Hail also is the work of a spirit, which, under the rules of sympathetic magic, can be scared by cutting the hailstones with a knife; or the business of repelling it is entrusted to a special magician, like the ēdāri of eastern Bengāl, who, when a storm approaches, rushes almost naked from his hut, with a rattan wand in his right hand, invoking Paramēsvara, the Supreme God. He ascends a mound, and, spreading abroad his hands and indicating by a motion of his wand the direction in which he desires the hail to pass away, he recites a series of doggerel incantations (Wise, 369 f.). The Gargapuri of the Central Provinces and the Woli or Cheel of Kumaon exercise similar functions (NINQ iii. 106; Central Provinces Gazetteer, 1870, p. 48).

12. Tree-spirits.—The tree with its waving leaves and branches, apparently dying in the autumn and waking to new life in the spring, providing various medicines and intoxicants, is naturally regarded as inhabited by a spirit. Such spirits, impersonations of the vague terrors of the jungle, the cause of death, accident, and disease to those who intrude within their domains, are generally regarded as malignant. But, when the tribe adopts a settled life, it is provided by the tree-spirit with a home and shelter. Tribes like the Mundās take care to preserve a patch of the primitive jungle in which the spirits disestablished by the woodman's axe may repossess. Here most of the tribal religious worship is practised (see OMS 114). The cult at a later period develops into reverence for one or other of the special varieties of trees, some of which, like those of the fig genus, are regarded as the abode of the collective gods; others are appropriated to the service of individual gods, as the Bel (Egle marmelos) to Siva, or the Tulasī (Ocimum sanctum) to Viṣṇu. Under the shade of the village tree, where the business of the
DRAVIDIANS (North India)

community is conducted, are placed the rude stones which collectively embody the Grâma-devâta, or local gods and godlings (see § 27).

These tree-spirits, in their most primitive conception, form a host of beings without special names, and to whom various functions are assigned. But in process of time they tend to become concentrated into one or more distinct personalities, like the Silvanns of the Romans. Such is the case, for instance, with the jangals of Konajhar, who stands at the head of their system, and is regarded with great veneration (Risley, Tribes and Castes, i. 333). We find also, in Bengal, Thânpati, one of the older gods of the Savârás, 'Lord of the sacred groves' (path) (20, ii. 244). In the same category is Sârnâ Bûrhi, the 'old lady of the grove' (satru), who corresponds to Deswalt, the 'lady of the cleared land' of the Mundâs (Bradley-Birt, Chods Nagaore, 20).

In the United Provinces her place is taken by Bansaâî Mâ (Skr. ranaspati, 'ruler of the wood'), who is known by the Musahars, a half-civilized jungle tribe, as Bansâli or Bansâli Gôra.

By her command the trees bear fruit, the bulbs grow in the earth, the bees make honey, the tussur worm fattens on the sâra, the deer, wolves, and jackals (useful as food to man) multiply their kind. She is the goddess of child-birth. To her the childless wife makes prayers for the grant of offspring and to her the midwife in the house of the sorcerer expels devils from the bodies of the possessed. In her name she is called upon to found a temple around the village and a wall, and she does a brick-kiln. Woe to the man who takes a false oath in the name of Bansâli! (Noesdor, Calcutta Res., lxxvi, 204). So strong are the beliefs of the sub-Himalayan Târît.

They fear the demons lurking in the forest trees, especially the weird cotton tree (Bombax kepha-phyllo).

'Only the terrible fire of wood will bring these poor bear- striken creatures to open their doors and remove the heavy barriers from their huts at night; and even in the daytime, amidst the songs of human life, the songs of the birds, and the crooning of cattle, no Tharû, man, woman, or child, will ever venture along the wood without a lead, a branch, or a piece of old rag upon the Bansâli formed at the entrance of the deep woods, to save themselves from the many diseases and accidents the gleeful and malicious spirits of the forests can bring upon and cause them. The Bansâli, or "good spirit" of the woods, is a square space cut in the grove, six feet by six, and covered with pine branches' (Knowles, 214).

Another form of this cult, already alluded to in the case of the Tharûs, is that of attaching rags to trees. Such thus decorated are found to be all over Northern India, and are known as Chithâryâ or Chithâriya Bhavâni, 'Our Lady of Tatters', or in the Panjâb as Lintâr Pir, or the 'Rag Saint' (Crooke, P.R. i. 101). The question of the motive of these rags has been much discussed by Hartland (LP, ii. 175 f.). Discarding the two most obvious explanations—either that they are offerings to the god or presiding spirit, or that they contain the disease of which one desires to be rid, and transfer it to any one who touches or handles them—he regards the rite as another application nature—same reasoning which underlies various ancient sense—chrom-therapeutic and folk-medicine.

In the same line of clothing in a whch a hand may cause me (1901, i. 352), while in contact with a beneficient power for the vague, amorous to me to health, or promote my disease and tenderness with that of my want, even the god, has by its contact, by the wound a peculiar bond with the wart; the

The evidence from Northern India corroborates this explanation, which throws much light on the Animistic practices which are discussed in the present article.

One peculiar custom connected with trees is that of marrying the bride and bridegroom to them—of which numerous examples have been collected in Northern India (Crooke, P.R ii. 116 f.). The object of this custom is obscure. In some cases it may be in order to communicate to the newly-wedded pair the vigorous reproductive power of the tree. In most cases, however, the intention seems to be to transfer to the tree the malignant spirit influence which menaces them, and, in particular, endangers the fertility of the union (Frazer, GB ii. 195 f.).

13. Worship of Mother Earth.— From the worship of the vague spiritual beings with whom the Dravidian peoples the forests amidst which he dwells, and in which he collects the game, roots, and fruits which constitute his only food supply, we pass on to the worship of the Earth-Mother, which marks the adoption of a settled life and his earliest experiments in agriculture. Among many savage races the Earth-deity is spiritualized as female (Tylor, i. 326); and it has been suggested with some degree of probability that the predominance of Mâ continue in the mediTherian-man in the Earth-deity represents a survival from the matriarchate, the prevalence of which has been attested in India by a considerable amount of evidence (J. E. Harrison, Proleg. to Gr. Religion, 1900, p. 291, 499; Risley, Gait, Census Report, i. 448). As in the case of the Greek Thesmophoria, the gist of which was a mimicking of Nature's processes, in a word, the ritual of sympathetic or mimetic magic—the women fasting seated on the ground because the earth was desolate, then rising and reveling to stir the Megara to imitate the impulse of spring—the North Indian cult of Mother Earth is largely in the hands of women. Again, though we find in the Rigveda the personification of Dyans and Prithivé respectively gods of heaven and earth, from whom the other deities and even the whole universe were supposed to spring, this cult is quite different from that of the Earth-Mother as we find it among the Dravidians (Monier-Williams, Brâhmânism and Hinduism, 1891, p. 182; Oppert, 402).

14. Restoration of the fertility of the Earth-Mother.—The theory of the Dravidians of many primitive races, e.g. the Romans (Granger, Worship of Romans, 1895, p. 208), is that the Earth after bearing each successive harvest becomes exhausted, and that if she is to continue to discharge her functions she must be recharged and restored to activity. In one of the dances of the Kol women of Chôta Nagpur, they all kneel and pat the ground with their hands in time to the music, as if exating the earth to be fertile; and this also doubtless is the intention of the Orion dance when the performers all face inward and simultaneously jumping up come down on the ground with a resounding thump that marks the finale of the movement (Dietrich, 498, 626).

The same rite was performed at the worship of Demeter Cidaria in Arcadia, and it is found in many other parts of the world (Frazer, Pausan., 1900, iv. 259). Secondly, among the Gôth (Ntl. Voy. of Bran, ii. (1897) 150), it was believed that the Earth-spirit needed to be periodically refreshed with human blood. This was one of the ideas underlying the custom of the sacrifices among the Kândus (g.v.). Thirdly, the fertility of the soil was supposed to depend upon the periodical marriage of Mother Earth with her male consort. The cult of this divine pair meets us throughout the whole range of Dravidian myth, belief, and ritual. Thus in Bengal we find Bûrhi, Bûrhi.
DRAVIDIANS (North India)

15. Marriage of the Earth-goddess.—The rites of symbolic marriage of the Earth-Mother to her partner are performed with a certain amount of trouble; they generally haunt a sacred tree, but in their worship, if a perfect tree be not procurable, a branch of it will answer the purpose (Crooke, 420). In among branch trees and in caves the bridal pair, the pair Dik and Deohārīn, the impersonated protectors of the village site (dik), and they also recognize as crop-guardians the pair Nīngī Bhāgīyā, the phallic tiger, to whom, when the grain is up, the first five handfuls, after being taken home and crushed, are offered; and Hariyārī Mātā, 'the mother of greenery,' to whom a burnt sacrifice is made in the field at sowing and harvest time (Crooke, Tribes and Castes, iii. 435, 447). The Pārvās, a forest tribe in Khāndesh, sacrifice, before harvest, goats and fowls, and make an offering of corn to a pair called Bar Kambā and Rānī Kajhāī, who occupy adjoining sacred trees; the pair are invoked at the marriage rites in a song which describes the wedding of these deities of the forest (BG xii. 97 f.). The divine pair worshipped by the Kharwārs of the United Provinces is Cenānḍā and Chāndā, and apparently moon-deities (the moon having a powerful influence over the fertility of the crops), who correspond to the Munda Desaullī and his wife, Jhīr and Dukī (Russel, Caste and Cunm., ii. 261). Among the Pālāmān (BG xii. 154 f.) the Kharwārs of Pālāmān reverence in the same way a pair known as Darbār and Dākīn, a boar and country spirits being offered to the male, and a sow and spirits to the female; in Mirzapur, their goddess Devī is associated with the cult of the phallic Gānsām (NINQ i. 40). In the United Provinces and Bihār we meet a pair of village sprites, Chandvere and his spouse Chandverī, or Jāk and Jakīn, who are known as the shooting deities, because husband and wife live in separate villages, and, when the crops in one village are more productive than those of another, the people think that the Jāk robs the fields of the barren tract to support his wife. This reminds us of the law of the XII Tables, which 'forbade people to spirit away the crops from a neighbour's field by means of spells and incantations' (Crooke, TC ii. 447; Frazer, Pausanias, v. 57).

In a higher stage of culture among the people of Bengal, Sītālā, a form of the Mother-goddess, who presides over smallpox, has as her husband Ghantaśkarāmba, who is now being adopted into the cult of the goddess Kālī, a pair of these goddesses being offered to a partner (Gait, Bengal Census Report, i. 193). The patron pair in Rājputāna are Ėklinga, whose name betrays his phallic origin, now known as Jāk and Jakīn, who are known as the shooting deities, because husband and wife live in separate villages, and, when the crops in one village are more productive than those of another, the people think that the Jāk robs the fields of the barren tract to support his wife. This reminds us of the law of the XII Tables, which 'forbade people to spirit away the crops from a neighbour's field by means of spells and incantations' (Crooke, TC ii. 447; Frazer, Pausanias, v. 57).

A small trench is then excavated, in which barley is sown; the ground is irrigated and artificial heat supplied. When this is done, the females join hands and dance round it, invoking the blessings of Gaurī on their husbands. The young corn is then taken up, distributed, and presented by the females to the other grains. Then the males eat it in their turbans' (Tod, i. 608). This is one of the Gardens of Adonis so fully illustrated by Frazer (Adonis, Attis, Osiris, 1907, p. 194 f.). In Southern India every villager is associated with the Earth-goddess Bhumi-devī, as her Sūvā (Opper, 356); and in a still later development Sūva is represented in his androgynous form as Ardhanārīsī, with a hermaphroditic body, uniting in himself the principles of male and female generation.

16. Ritual of the worship of Mother Earth. Among the forest tribes of the Central Hills, Mother Earth is supposed to live with the other village gods in a pile of stones collected round the sacred tree of the hamlet. Worship is done through the baīja (q.e.), or aboriginal priest, at the chief agr-
18. The Mother identified with the snake.—In her chthonic aspect the Mother-goddes and her partner are naturally identified with the snake, an animal which lives in holes and moves in the darkness. This was the case at the Greek Theomorphia, where it is intimated that we have seen (§§ 9, 14), grown-up women have private services of their own, which are distinct from the tribal celebrations. Other tribes worship her when they begin to plant their seed, and ploughing, the ploughing-goddess, or gleaming the petals of the mahua (Bassia latifolia). With some tribes the offering consists of molasses, butter, cakes, a fowl, and some spirits. According to the principles of mimetic magic, the god is of the grey-coloured, and the fowl speckled (NYI Q. l. 77).

17. Her benign and malevolent aspect.—In fact, the character of the offering marks the twofold conception of the goddess. In her benign form she is Mother of all things, giver of corn, producer of fertility in man and beast. Accordingly she is presented with offerings of flowers, milk, or the fruits of the earth. In her malevolent and chthonic aspect her malevolent nature is recognized by a tribe which dispose of their dead by inhumation, she is appeased by blood sacrifices of animals, or even, as in the case of the Kandhis, with human victims. Worship of this tribe (Calcutta Rev. v. 51), states that in her malevolent form, as the supreme power,

"when a tribe engages in war with enemies of another race, her awful name is invoked, and vows of sacrifice are recorded in the event of success. Her nature is purely malevolent; but she does not seem to interfere with the independent action of other deities in their respective spheres, and she is nowhere peculiarly present."

On the other hand, in her benign character she represents the Greek Gaia. Upon her depend the fecundity of the soil and the growth of all rural produce; the preservation of the patriarchal houses, the health and contentment of the people, and, in especial manner, the safety of the flocks and their attendants. She is worshipped by human sacrifices. She has no fixed corporeal shape, form, image, symbol, or temple. But she, together with the other superior gods, may temporarily assume any earthly form at pleasure; as, for instance, the tiger as convenient for purposes of wrath."

In her benign form, among the Kharwaras of Mirzapur she is honour: by sprinkling pulse and rice on the ground, with the prayer: 'Mother Earth! Keep us in prosperity, and protect the ploughman and oxen!' (NYI Q. 141); while the orthodox at the time of sowing and harvest, prays: 'I salute the Earth, the realizer of all desires, she who is blessed with all kinds of riches and creatures; she who is contented, faithful, and virtuous, the giver of all that one asks for the realization of desires' (ib. v. 76). In the eastern Punjab she takes the form of Shāh Mātā, 'Mother of fertility,' and she is represented by a plough coultor placed between two round balls of cow-dung, probably with a phallic significance. Over these are laid leaves of holy trees, and the peasant, as he measures the corn on the threshing-floor, prays: 'O Mother Shāh! Give us increase, and make our bankers and rulers contented!' (ib. l. 173). Her epithets in the Kandhi prayer: 'We are not satisfied with our wealth; but what we do possess we owe to you, and for the future we hope for the fulfillment of our desires. We intend to give such a dog as shall such a village, to bring human flesh for you. We trust to attain our desires through this service. Forget not the oblation!' (Macpherson, Memorials, 1802, p. 179).

19. The cult of the Earth-Mother developing into a general Mother-cult.—It seems probable that from this primitive conception of the Earth-Mother as either kindly or malevolent has developed the worship of the Mother-goddesses, which forms such an important element in the beliefs of the people of Northern India. As in the Greek vase she appears rising out of a mound, so Ellamānā’s image is a figure hewn in stone, fashioned so that only the hand is visible, while the body is concealed in the earth; and the same conception appears in Buddhist bas-reliefs, where we find the Earth-goddess, Mahāpatathā or Prithivī, rising out of the ground and supporting the horse of the Master (J. E. Harrison, op. cit. 277 ff.; Oppert, 468; Grünwedel, Buddhist Art in India, 1901, p. 100 f.).

This conception of the Mother-goddess seems to be the most important element in the Dravidian cultus which is identical with the Mother Earth. Like the Earth-Mother, the other Mothers appear in a double manifestation, at once benignant and malevolent. This is shown in the epithets of Devī, who is the most common type of the class—Kanyā, 'the maiden'; Kanyākumāri, 'the youthful virgin'; Sarvamāngalā, 'always auspicious'; Sākambhāri, 'nourisher of herbs'; and, on the other side, Chāna, 'the destructive'; Kāli, 'the black one'; Rānjā, 'the fierce'; Raktadānti, 'bloody-toothed.' It is this contrariety of aspect which renders the cult of the Mother-goddesses so perplexing. In one contrasted and yet identical form they both appear in the eastern Bengal and the Mother is usually worshipped under the form of Siddhāśvarī, 'perfected queen,' or Vṛddhāśvarī, 'old queen'; but when epidemic diseases rage in such a district, an emphatic epithet is Rākhṣyā or Bhadrā Kālī, 'Kālī the protector, the auspicious' (Wise. 135). In this benignent form she is one of the favourite objects of worship in Bihār as Kēsakarnī, 'she who confers pleasure' (Bhāgavata, 15. 49). In the Central Provinces the village-goddess Devī represents the Earth-goddess; she can cause or avert smallpox and cholera, and is inseparable in the body of any one suffering from the former disease; and so much so that those who enter the room where the
patient teas take off their shoes as a mark of respect to her (Russell, i. 79).

20. Varied manifestations of the Mothers.—Hence the manifestations of the Mothers are infinitely varied. Thakurgali, who has a shrine at Anjar in Kachchh, is the 'looking-glass goddess,' before whom the votary worships his own image on a sheet of silvered glass; but, to illustrate the clasmaty of this phenomenon, it is said to have been originally a Chārān woman, who when attacked by robbers committed suicide, and was elevated to the rank of a manifestation of the divinity (BG. v. 212). Another group of six Mothers in Kathiāvār are also said to be the daughters of a Chārān who was dismissed from court as unlucky because he was childless. He practiced superstitions at a shrine of Kali, and his six daughters, who were born in response to a prayer addressed to the goddess, became Mothers (ib. viii. 642 f.). The cult, in fact, is vague in the extreme. The worship of Ekvīrā, the Mother of the Kārī Caves, is mixed up with the original Buddhism, of which this place was a centre, part of the cultus being the circumambulation of a dagoba, or Buddhist relic shrine; and the temple of the Turturāīīa Mother is served by women, who are supposed to be modern representatives of the ancient Symbols (ib. xi. 43; Cunningham, Archæological Reports, xiii. 147). It is in Western India that the Mother-cult most widely prevails. Each Rājput clan in Kathiāvār has a particular Mother, whose sanctuary is dedicated to Maīa with her brides immediately after marriage, and the mint at Navanagar is presided over by the Mother Aśāpātr, 'hope-fuiller'; but poulage goes on under her very eyes.

21. Ritual of Mother-worship.—The worship at the famous shrine of Bohehrāī in Baroda may be taken as an example of the ritual of the Mother-cult, which here is almost purely Animistic. Every morning the head officiant, after ablution, enters the adytum and pours a mixture of milk, curds, clarified butter, sugar, and honey—known collectively as pāchāmātrī, 'the five divine foods'—over the image, and drops water over it through a perforated metal pot, while a Brāhmān chants hymns from the Veda. Coloured powder and flowers are placed upon the image, incense and camphor are burnt, and silver lamps are kept lighted day and night. After the worship, the priest takes his food (ḍhābāghoj) consisting of wheat-flour, sugar, and clarified butter, is offered with a coco-nut (a survival of human sacrifice), and the morning service ends with the ringing of bells, burning of camphor, ringing of bells, and beating of gongs. Another meal of sugar and milk is offered to the goddess about 10 a.m., a little being sprinkled over the image, and the rest consumed by the priests. In the evening a passage of the sacred book telling of the exploits of the Devi is read, the figure is washed and worshipped, and more cooked food is presented (BG vii. 611 f.).

More usually the Devi or Kali receives a blood offering, some of which is sprinkled upon the altar (see DEVĪ FATA).

Of all the orthodox Hindu cults that of Devi is most akin to Animism, and hence many of the forest tribes of the Central Hills accept as representatives of their many village-goddesses, such as Khumātā, primarily an Earth-goddess; the Desāhīī Devi, goddess of the four quarters of the hamlet; and the Chidhēlīiī Devi, who has a shrine at Nārāyana, one of the various local incarnations like the Vindhyābāsī Devi, the goddess of the Vindhyā range (Russell, i. 53). In the Panjab we find unmarried girls receiving special treatment as the image of the goddess, to whom, as to the goddess, offerings are made twice a year. Here also, girls make images of Siva and his spouse Pārvati, Devi in her mountain form, and afterwards throw them into the water. The popular explanation is that this rite commemorates the suicide of a woman married to a boy husband.

But a different explanation has been suggested. The deities Śiva and Pārvati are regarded as the soul and body of one, and their images are placed in branches over a heap of flowers and grass; but some localities leave many people in doubt until we have full details of the rites observed at all the festivals of Devi we cannot hope to discover the ideas underlying these local rites (Ross, i. 76).
that mountains were formed by rival divine or evil powers warring with each other and using the rocks as missiles (VII Q. i. 47). The cult of mountains is an ancient one in Dravidian; bundling sacred hill or hill-top is very doubtful, and at any rate the reverence paid by the Aryans to the mighty Himalayan peaks must have dated from the time when they first came under observation. Many of them became seats of the Hindu gods, and one title of Siva is Girisa, while that of his consort is Pârvati, both meaning 'mountain-dweller.'

In Bengal the Mundas, Santals, Mallis, and others worship a mountain god called Marang Burû or Bar Pahar, 'great mountain,' to whom their tribal priest makes sacrifice of buffaloes and other animals. These sacrifices are made at the chief visible habitation of the deity, a bluff near Lodhia (Gait, i. 191).

In the Hoshangâbâd district of the Central Provinces, Sûryabhan, or 'Sun-rays,' is a common name for isolated, round-peaked hills, on which the Sûn-god is believed to dwell; and on one of the Kûrâgâb hills, Dûngar Deo, 'the mountain-god,' resides on the nearest hill outside the village, where yearly at the Dasahra festival he is worshipped with an offering of five cows, a buffalo, and a ball of vermilion paste. They regard him as their tribal god (Elliott, Settlement Report, 1867, pp. 121, 254).

24. Animal-worship.—The Northern Dravidians share with other primitive races the belief that animal intelligence is identical with that of man; that animals can, as in the folk-tale world, talk and act precisely as men do; that men and animals may for a time resume the forms which had once been theirs, or, for that matter, take any other. Hence shape-shifting, as it has been called, is widely accepted, and it may even take place by means of death and a new birth, the powers and qualities or even the actual form of a deceased ancestor being reproduced in his descendants. Hence various animals are worshipped within the Dravidian area, of which a few instances will be given here to illustrate the local cults as a supplement to the facts collected in art. ANIMALS.

(a) The horse.—Some of the Rajput tribes of Gujrât worship Ghôrâ Deva, 'the horse-god,' in the form of a horse of stone, at their main festivals; and on the sixth day after a birth the Ojah Kumhâr potters of Kacchh form a horse of clay and make the child worship it (Campbell, Notes, 292). One of the chief gods of the Goths is Kundayen, the horse of the god who is worshipped on the outskirts of the village, or at the village gates, during the rainy season. Only men join in the worship, women being excluded. The bûnamak priest besmears the stone with red lead, presents a horse made of pottery, then a heifer, on the head of which he pours spirits and prays: Thou art the guardian of the village; we have come and offered to thee according to our ability. If in anything we have failed to please thee, forgive us. Protect our oxen and cows; keep us in safety; let there be no fear in the jungle. After this the victim is slain and boiled, some of the meat is laid with flour before the horse, and the worshippers eat the remainder of the food. Campbell, Notes, 191 (p. i. iii). The Goths and other Central Indian tribes place earthenware horses on the tombs of ancestors and on the village shrines, which serve as steeds for the sâinted dead and for the local gods.

(b) The tiger.—The tiger is naturally worshipped by the forest tribes. Bîghsvâr, 'the tiger lord,' is a favourite deity along the Vindhyan and Karnâta hills. The Santals and Kisans worship him as Bûmrajâ, 'forest king,' who will not kill man, and believe that he spares them in return for their devotion. Even those who do not actually worship him swear by his name or on his skin, as is the case among the Hos and Jângâs (Dalton, 132, 133, 158, 214). The tribes further west, like the Kûrâgâs, worship Bâgî or Vâgh Deo, and a female form called Vâghâdi. Dharma in this case pretends to know spells by which he can protect himself and his parishioners from the beast (Berar Gazetteer, 191 f.; Elliott, op. cit. 255 f.). The belief in tiger-men, or men who are really metamorphosed tigers, is so common, the man-eater being often a person of evil life changed into that form (Gait, Assam Census, i. 250 f.; Crooke, PB ii. 216 f.).

(c) The cow.—Cow-worship, which appears to arise among pastoral tribes which have attained some degree of culture, is naturally not found highly developed among the Dravidians, and the life of the animal is not protected by the effective tabu enforced by orthodox Hinduism. The Gonds, for instance, kill a cow at the funeral rites and hang the tail of the victim on the grave-stone as a sign that the obsequies have been duly performed; and the Kûrâgâs among the Kûrâgâs Dûngar Deo, 'the mountain-god,' resides on the nearest hill outside the village, where yearly at the Dasahra festival he is worshipped with an offering of five cows, a buffalo, and a ball of vermilion paste. They regard him as their tribal god (Elliott, Settlement Report, 1867, pp. 121, 254).

It is only among the semi-Hinduized forest tribes that the cult of the cow has made much progress. In Nepal, where under the present dynasty the rules of Hinduism are rigidly enforced, it is deemed the highest sacrifice to approach the image of the sacred animal, except in a position of adoration, 'insomuch that a malicious person, wishing to suspend the agricultural operations of his neighbour, would be sure to effect his purpose by placing a stone or wooden figure of a cow in the midst of a field' (Kirkpatrick, 100). Further west the cult of the cow is closely connected with that of Krya, and in Central India we have the curious rite of the silent tendance of cattle, in which the performers, drawn from the highest classes of the community, bathe, anoint themselves, put on garlands of flowers, and walk in procession through the grazing grounds, holding bunches of peacock feathers (NinQ i. 154 f.). Special godlings are also worshipped to secure the safety of cattle. Nagar Deo in Garhwal on the lower Himalaya is supposed to have the cattle in his charge, and he is represented by a tripod fixed on a platform to which the first milk given by the animals is dedicated. In Kumân his place is taken by Chaumû or Baudhûn, who recovers stray beasts, rears calves, and is the protector of the cattle. When the animal is found, he is blessed by the sacrifice of a goat (NinQ i. 56). Among the Kârrâs of the Central Hills, Gaurâyâ or Gaunrayâ, properly a god of boundaries, presides over the herds (Crooke, Tribes and Castes, li. 251).

(d) The dog.—In common with the Kunsch of Khândesh, the Bihils of that district show extreme reverence to the dog and horse; and the dog is respected by all Marâthas, a load of an animal as the companion of their god Blissorâ; and by many Hindus in Western India, who worship the dog of their god Kâli Bhairava (Campbell, Notes, 270). At the shrine of Malhari in Bhavnâr the Vaggâyîyas minutely dress in blue woolen coats, tie belts and skins round their waists, and meet the pilgrims barking and howling like dogs. They endeavour, in fact, to assimilate their appearance to that of the god whom they serve (Robertson Smith, Rel. Semites, 457). Each Vaggâyîya has a bowl into which the pilgrims put food; the Vaggâyîyas lay these down, fight with each other like dogs, and plant their faces in the ground. After a few mouths, as animals do, into the bowls and eat the contents (BG xxii. 212). The cults of Bhairobra or Bhaivara, and of Khândru Rão, Khânfôba, or
DRAVIDIANS (North India)

Khąpojī (now promoted to be an incarnation of Siva), which are widely spread in Western India, have dog-worship as their basis. The Bauris of Bengal will on no account touch a dog, and the water of a tank in which a dog has been drowned cannot be used. It is said that this is because the animal had purified it. Under the influence of the Hindus they have now invented a legend that, as they themselves kill cows and other animals, they deem it right to regard as sacred that which is often holy to them as the cow is to Brāhmans; this, as Risley remarks ( Tribes and Castes, i. 79 ff.), being 'a neat reconciliation of the twinges of conscience and cravings of appetite.' But it seems clear that this is an afterthought, and that, the dog being really the sacred animal of the tribe, its 'uncleanliness' resulted from its sanctity, as in the case of the pig among the Semites and other races (Frazer, Pausanias, iv. 127 ff.). In general it may be said that all so-called unclean animals were originally sacred; the reason for not eating them was that they were divine (GB ii. 315).

In India, birds are regarded as sacred by the Northern Dravidians and the sanctity of the others, like the crow, the pigeon, and the waggtail, is suggested by the respect paid to omens taken from them. The skin of a species of Bucerus or hawks is used in an early stage of wealth (dhana-chiryā), is hung up in houses by wizards in the Central Provinces, and the thigh bones are attached to the wrists of children as a charm against evil spirits (Hilop, 6). The peacock seems among the Kandus to impersonate the Earth-Mother, because they placed an effigy of the bird on the top of the merisāh, or human sacrifice-post (Malothy-Leman, Manual of Ganjam, 1882, p. 84).

Fish are regarded in many places as sacred. Some are believed to contain the souls of the dead; all varieties are emblems of fertility, and are therefore used in the marriage rites. At most of the sacred places in Northern India along the sacred rivers, such as Hardwar, Mathurā, and Benares, the fish in that portion of the stream adjoining the bathing places are carefully preserved, and any attempt to catch them is fiercely resented by the Brāhmans. The taboo here enforced is partly due to the sanctity of the holy place which makes things connected with it sacred (Jevons, Intro. 63); they are also popularly regarded as the presences of the surviving character of the stream, and as connected with the dead whose ashes are consigned to its waters. They have now been adopted into the cults of the Hindu gods, and pious people write the name of Rāma on their backs, and of the Mother-cult, at which they enclose in little packets and throw to the fish. Once Sīta, wife of Rāma, was bathing in a Deccan stream, when one of the fish bit her leg. If one be now caught and its palate examined, in it will be found a ball of batter (BG xviii. pt. i. 93). The crocodile is worshipped as an object of terror. In Baroda the crocodile god, Magar Deo, is worshipped once a year to protect men from the attacks of these monsters, and also as a preventative against illness. The deity is represented by a piece of wood in the form of the animal, supported on two posts (Dalal, i. 157).

In India, to regard as sacred a portion paid to some of these animals may rest upon a totemistic basis; but it is difficult to say where, in Northern India, the line can be drawn between animal-worship and totemism. A source of totemism which is in accordance with the current beliefs of the Dravidians is obscure; and totemism, as we find it at present, generally appears as a mode of defining the exogamous groups, many of which trace their descent from some animal, plant, or other thing which the members of the group regard as sacred and will not eat or injure. The totemistic exogamous groups have been discussed by Risley (Tribes and Castes, i., Introd. xiii ff., and Dalton (254). The latter states that among the Oráons 'the family or tribal names are usually those of animals and plants, and that when the name of the animal or fruit of the tree is tabbed to the tribe called after it.' This respect for the totem seems now hardly to exist among the totemistic Dravidian tribes of the Central Provinces, the sacred animals and animals having generally been adopted into the cult of some Hindu deity (Russell, l. 159 f.). The feeling of reverence is still strong in Central India, where the totem tree is never cut or injured; men make obeisance to it, and when they weep their faces when it pass (Luard, i. 198 f.).

26. Local village-godlings.—Writing more particularly of the Semites, Robertson Smith (Rel. Semit. ii. 92) remarks that 'the activity, power, and dominion of the gods were conceived as bounded by certain local limits, and, in the second place, they were conceived as having their residences and homes at certain fixed sanctuaries.' In order of time the worship of the totemistic tribes is probably later than that of the celestial gods, as they can hardly exist under the conditions of a nomadic life, and their worship probably marks the foundation of the cults of the races of these gods, as appears from the character of the priesthood (§ 49), has no connexion with Brāhmanical Hinduism. They vary in name, character, and function, in the country. But all have one distinguishing mark—their influence is confined to a particular area, and it is only when some shrine has, by cures and wonders performed within its precincts, acquired a more than local reputation that it attracts the worship of persons residing beyond its special domain. When this stage is reached, it leads to the establishment of a local cult, which, as it develops and becomes important, is generally annexed by some priest drawn from the orthodox ranks of Brāhmanism, and the local god is gradually promoted to a seat in the regular Hindu pantheon.

27. The village shrine.—The general name for these gods is Čāma- or Čāmān-devatā, 'the godlings of the village,' or in the modern vernacular Gān-devatā or Gān-devī, the last title marking connexion with the Mother-cult. Sometimes, again, they are known as Gān-devatā. The name of the shrine is called Deōhar, 'holly place'—a term which is also applied to the whole body of village gods. In its simplest form the village shrine is a collection of water-worn stones placed under the sacred tree of the village, in the Plains, where all stones are scarce, pieces of old carving from a ruined Buddhist or Hindu religious building are often used for this purpose, and occasionally the desecrated image of the Buddha may be seen doing service as the representative of the village Devi or her consort. Sometimes ancient stone axes, looked on with awe by people who now use none but metal implements, have been found in such places. In the more proper guise a small square building of brick masonry, with a bulbous head and perhaps an iron spike as a finial, serves as a shrine. Its position is marked by a red flag hung from the adjoining sacred oak, which is erected close by to serve as a perch for the deity when he deigns to visit the shrine to receive the offerings and attend to the prayers of his votaries. In the villages occupied by the purer Dravidian tribes, such as the Lower Dravida, the shrine is usually a rude mud hut roofed with bamboo and straw, which is often allowed to fall into disrepair until the godling reminds his votaries of his displeasure by bringing sickness or some other calamity upon them. Inside is a small mud plat-
form, on which a jar of water is usually placed and offerings are made.

No clear distinction is made between the various kinds of spirits which occupy such a shrine. First, there are the purely elementary deities, like the Earth-goddess and the moon-goddess, whose spirits which are regarded as generally benign, like the Satī, the spirit of a woman who died on the pyre of her husband, or those which are actively malignant. Thus on the borders of the hill country where the Aryan invader may introduce what is called a brahmin, a shrine in honour of some defiled Brāhman, where the worshipper makes anlibation of milk or curds, lights a lamp, and offers the fire-service (homa); and in an adjoining Dravidian village a baghūt, a rude shrine or cairn erected on the spot where a man was killed by a tiger, at which a Kol makes an occasional sacrifice (NY&Q ii. 10). In the case of the Pandja, the fusion of cults is equally obvious. Wilson (op. cit. i. 147) describes at Kānq a shrine erected by the Chāmāra, or mendicant Hindu leather-dressers, inside which they light a lamp twice a month, and "when they are in trouble they would come to this shrine and bow down before it, and promise that if their trouble were removed, once a month, they would present some offering, such as bread, or a coconut, or a flag. If the saint fulfilled his part of the bargain, the worshipper followed his latter a month, the vow was regarded as fulfilled. Thus I was told that a small flag waving over the shrine had been presented by a man named Bill, and who had promised to offer a flag on his recovery. Often a shrine may be seen outside the village to the village god, or to the smallest god, or some other deity, where at set times the women make offerings of water or gruel; and a small lamp may be often seen burning on a Thursday evening at the tomb of a Muhammadan saint. These practices are said to be forbidden in the Koran; but the women especially place some faith in them, and a Bāīn is said to have divorced his wife because she persisted in light- ing lamps at a Fakhīr's tomb, in hope of being blessed with a son.

This concrete instance admirably illustrates the beliefs of the low-class Musalman population, who are in the main converts from Dravidian tribes, and whose faith in the tenets of the Prophet is only a thin veneer over their primitive Animistic creed. In the same part of the country we often find the worship of Bhūmiyā, the earth-god, combined with that of one of the great Ma- hammadan saints; and in one village it appeared that the Hindu Jāts distrusted their worship between the saint Shāikh Ahmad Chishti of Ajmer (q.v.), Brāhmanus, and the Pipal, or sacred fig-tree. Once again, in the hill-country where caves are found, they are utilized as local shrines. They are places of mystery, the fitting abode of the gods, and it is believed that they form an entrance to the nether world. Such cave-shrines are numerous in the lower Himalayas, and many of them have been appropriated by the orthodox Hindū gods (NY&Q ii. 147). They are the prototypes of the great cave-temples of the Buddhists and Hindus, like Ajanta or Elephanta (q.v.).

28. General characteristics of the Grāma-devata worship.—It is obviously impossible to attempt any precise definition of vague, amorphous beliefs such as these. The creed of the lower classes of the population is, on the one hand, purely Animistic, a cult of the powers of Nature. On the other hand, it has been added a belief in the necessity of propitiating sundry goblins and evil spirits, many of the latter being the angry ghosts of persons who have perished by a tragic or untimely death. This has, again, absorbed from Hinduism the worship of Brahmanus, and from Mahābāla, the spirit of the spot, or that of the essential god of Islam. Further, we occasionally find more than one element united in a single cult. It is, therefore, unnecessary to attempt to compile a list of these vague-goddings. A few examples may be given to indicate the general character of this form of worship.

29. Worship of Gānāum Deo.—Ganaum Deo is an important god of the Gonds, Kols, and kindred races. An attempt is now being made to give him a place in Hinduism as a form of Kṛṣṇa; but his Dravidian origin is apparent. In Mirzapur he is particularly venerated, and an Aryan priest propitiates him, when the rice is ripening, with the sacrifice of a fowl, goat, or sucking-pig, and an oblination of liquor. He generally resides in a tree, and near his shrine is usually placed a rude stone representing Devī. We have here another instance of the cult of the male and female element performed to stimulate the growth of the crops (Crooke, Tribes and Castes, iii. 312).

But Ganaum was another of the blessings supposed to be a chieftan of the Gonds who was killed by a tiger. His legend tells that after his death he visited his wife, and she conceived by him.

*Descendants of this ghostly essence are, it is said, living to this day at Amuda, in the Central Provinces. He, about the same time, appeared to many of his old friends, and persuaded them that he could save them from the maws of tigers and other calamities, if his worship were duly inaugurated and regularly performed; and it was in the following year that festivals were established in his honour; but he may be worshipped at any time, and his shrines are usually under a tree, and misfortune confidently appeal to him (Dalton, 325).

20. Worship of Bhairon.—Bhairon, another favourite Dravidian god, is often confounded with Bhūmiyā, who is one form of the consort of the Mother-goddess. He has been appropriated into Hinduism as Kāl Bhairava, who is often depicted with eighteen arms, ornamented with a garland of skulls, with ear-rings and armlets formed of skulls, a serpent coiled round his head, in his hands a sword and a bawl of blood. He is thus a fitting partner to the blood-stained Mother, Kālī. But it seems clear that in the primitive conception he is one of the divine pair to whose union the fertility of all people is due. Even in his Hinduized form as Kāl Bhairava he retains the characters of Animism. As worshipped by the Kuni cultivators in the Deccan, he is represented as a man standing; in one hand a trident, in the other a drum shaped like an hour-glass, while he is encircled by a serpent, a mark of his chthonic origin. He appears again in an underworld with oil and vermilion, and he remains kindly so long as he is supplied with offerings of butter. He causes snake-bites, and tells whether an undertaking will do well or will fail. On the chest of the god there are two small holes. The person who wishes to consult the god places a betel-nut in each of the holes, and explains to Bhairav that if it is white and betel-nut fails first, the undertaking will fail; and that if the betel-nut fails first it will mean that the undertaking will fall. He is a god of the earth, according as the event is to be, to let the lucky or the unlucky nut fall first. He tells the god that if he will drop the lucky nut, and if his undertaking prospers, he will give the god a cock or a goat. Twice a year, before they begin to sow and before they begin to reap, the villagers come in procession and worship Bhairav* (BG xvii. p. 289).

Bhairon or Bhūmiyā is also known as Khetprāl, or 'field-guardian.' In the Pandja, when the crop is nearly ripe the BRAHMANUS are consulted to fix an auspicious time for reaping; and, before the work is begun, five or seven loaves of bread, a pitcher of water, and a small quantity of the crop are set aside in the name of Khetprāl (Rose, i. 126). Bhūmiyā, again, at times changes sex, and is identified with the Earth-Mother, and provided with a consort in Chandwând or Kheri, the per- sonification of the village site (NY&Q v. 180). Like his consort, Bhūmiyā has a male and female aspect. He is said to visit with sickness those who show him disrespect, as, for instance, by cleaning their teeth near his shrine.

*These Bhūmiyās, who thus bear the reputation of being revengeful and vicious in temper are respected, and offerings to them are often made; while those who have the character of easy, good-natured fellows are neglected (NY&Q iii. 107).
31. Worship of Hanumān, the monkey-god.—In the same grade is the monkey-god, Hanumān, Hanumān, 'he with the jaws,' also known as Marnti or Mahābīr, 'the great hero,' who has become fully adopted into Hinduism as the helper of the god Rāma in his war against the demon Rāvana, which forms the subject of the epic of the Rāmāyāṇa. He is, however, plainly a survival from the old theriolarity. He is represented by a rude image, combining human and monkey characteristics, an image which was very prominent, and the whole smeared with vermillion. He is an especial favourite with the Marāthas; but most villages in Northern India have a shrine dedicated to Hanumān, and the establishment of his image is one of the first formal acts performed at the settlement of a new hamlet. In every fort, built or re-built by Sivaji, the Marāthā hero, he placed inside the main gate a small shrine with an image of Hanumān (BG x. 335). Even now this god has hardly gained full franchise in the Hindu pantheon, and in the greater shrines he acts as warden (deva-rājā) to the higher gods. He has now become a fighting partner of the Mother-goddess, and he is essentially a Dravidian god, bearing in his representation among the Dravidian Suiris of Mirzapur little of the monkey-character except his long tail; and he is identified with the Vedic Varuṇa, god of the dark wild Bhuīyās of Kounjah (Buchanan, i. 467; Dalton, 147). Some years ago, when an epidemic broke out among the forest Kāthkaris of Nāsik, they believed that it was a judgment upon them because they used to kill and eat the sacred Hannmān monkeys. They fled the country for a time in order to escape his vengeance (BG xvi. 65).

32. Spirit-worship.—Besides local gods of this class, most of whom are associated with the fertility of the land, cattle, and people, the Dravidian is beset by a host of spirits of another kind.

First come the vague terrific forms, the impersonations of awe and terror, spirits of the waste or of the darkness, like the jīvaṃ of Semitic folk-lore—the Rākṣasas, the Bīr or Vīra, the Dāno, the Dāitṛyas. These are now all known by Aryan names, but their representatives were also doubtless found among the Dravidians. Some account of these, and other like vague potentialities, will be found under BENGAL, § 8, DOMS, § 2, and DEMONS AND SPIRITS (Indian).

Secondly, there is the worship of Bhūta or Bhūtās, the restless spirits of those who have perished by an untimely death, or have failed to reach their longed-for rest, because they have not been honoured or obeyed. They are generally malignant, and if not regularly propitiated bring disease or other suffering on those who neglect their service. Such are Rāja Lākhan, worshipped by the Kols with his sister Belā, and Rāja Chandol, the tutelary god of the Korās. Most of these seem to be historical personages. Rāja Lākhan apparently having been a leader of the Hindus against the Muhammadan conquerors. He is still held to be present and receive constant worship (Crooke, PR i. 198 ff.). In some cases this is the Harāni Lālā, the cholera godling, and Haridās Bābā, the patron deity of the Ahirs (p. 47). This process of delination of persons famous or notorious in life, still goes on actively.

33. Boundary-worship.—The local character of the worship of the village-gods is shown by the respect paid to boundaries, and in the cult of the deities presiding over them. The Roman worship of Terminus, with the sanctity attached by the Latins to boundary-stones, is one of the most familiar examples of this class of beliefs (Smith, Dict. Antiq. i. 90 f.). Among the Gonds the village boundary is marked by a stake into which the ancestral ghosts (Sleeman, i. 269 f.). In its most primitive form the cult is found among the Dravidians of the Vindhyā and Kālīrāng ranges, who employ their bājīja priest to perambulate the village annually, and to report the presence of the common liquor, distilled from rice or other grains, in order to prevent the inroad of foreign spirits, who are regarded as necessarily hostile. The boundary, again, is often defined by making a goat walk along the disputed line, and watching it till it gives a shiver, which is regarded as an indication of the wishes of the spirit, whose adjudication is at once accepted (MNQ ii. 282). This boundary-spirit naturally develops into a deity in whose charge the line is placed. Thus, according to Macpherson, the Kandhs recognized Sundī Pamma as the boundary-god; particular points on the boundaries of districts, fixed by ancient usage, and generally upon highways, are his altars, and these demand each an annual victim, who is either an unsuspecting traveller struck down by the priests, or a sacrifice provided by purchase (Memoriai, 90; Calcutta Rev. v. 53). Among other tribes, like the Raṭtiās of Bengal, Goraiyā is regarded as a sort of rural Terminus; the Teli olinen offer a sucking-pig in the rainy season before the image is dried until the following spring, in the presence of the god, the victim after sacrificing being either buried in the ground or given to a Dosādh (p. 47), who seems to act as priest of the more primitive deities, and claims the offerings as his legitimate perquisite (Risley, Tribes and Castes, ii. 309). Another deity of the same type, Sewaōriyā, is the tribal god of the Bhuīyās and Ghāsīyās of the United Provinces, who sacrifice a goat and offer some fluids and a thick cake, the head of the animal and the cake being, the perquisite of the mahto, or headman, who performs the rite (Crooke, Tribes and Castes, ii. 45, 418). Among the Santās his place is occupied by the sima-bonga, the collective boundary-gods, who are propitiated twice a year with sacrifices of fowls offered on the boundary of the village where these deities are supposed to dwell (Risley, Tribes and Castes, ii. 234). Under the title of simantapījā, 'boundary-worship,' this has become part of the Hindu marriage-rites, the youth when he comes to fetch his bride being obliged to free himself from the foreign and hostile spirits which have accompanied him, by a rite of worship performed at the boundary of the village of his bride.

34. Implement-worship.—The worship paid to the implements used by the husbandmen...
tools of the artisan falls into a different class, which has sometimes been included under the head of Fetishism—a term which possesses no scientific value. In various forms it appears among the rural classes of the North West Provinces (L. N. von, 187). The mind of the east of Orissa, on the fourth day of the feast to Durgā, lay their razors, scissors, and mirror before the image of Visvakarma, their patron deity, with offerings of sweets and flowers, the god of artificers (Tribes and Castes, i. 29). The Kaibartā fishermen of Bengal Proper celebrate the feast of Jālpānī in the early spring, on the last day of which they lay their net, smeared with red lead, on the river bank (ib. i. 380). The Khāmār potters arrange their trade implements and specimens of their manufactures on the kiln, ornament them with leaves of the Bel tree (Eugé marmelos), and present oblations; while the Pāi palm-tappers set up their sickles and present offerings of flower and grain (ib. i. 525, ii. 167). Perhaps the most remarkable of these so-called fetishes is the garūrd, or sacred chain of the baigār prophet, which is kept in this highly venerated by the god. With this the baigār lashes himself into a state of ecstatic frenzy, and hysterical girls are thrashed with it to drive the devil out of them. This chain, under the name of Śakātī Pervi, is supposed to be worshiped by the priests of the Gonds, carried in procession, and solemnly deposited in the shrine (Hislop, App. p. 8; Crooke, Tribes and Castes, iii. 411). Among purely agricultural implements, honour is especially paid to the plough, the corn-sieve, basket, and broom used in cleaning and measuring grain, and the rice-pounder, to which a phallic significance naturally attaches (Crooke, Pād. ii. 12).

35. Stone-worship. Stones throughout Northern India are recognized as the abode of spirits and deities. One form of this worship, that of the lingam, or phallus, now appropriated to the cult of Siva, was formerly believed to have been adopted from the Dravidian tribes of the south by the Aryans (Oppert, 372 f.). This view is now generally rejected (Hopkins, Rel. of India, 1896, p. 471). It is said to be alluded to by the writers of the Veda in the śvā-sva, 'tail-gods,' but the cult was not openly acknowledged until the rise of Siva-worship in the Epic period (ib. 150, 462). The growth of this form of worship has been attributed to the Brahmins, and suggests that the lingam is in origin a miniature Buddhist dagoba, or relic-shrine (Hist. of East, and Ind. Architecture, 1889, p. 167). The worship of Siva in this form is now spread throughout India at least as early as the 6th or 7th cent. A. D. (Wilson, Essays, 1862-77, i. 224). Siva, again, is associated with the bull Nandi, and in this form may be compared with the Greek Dionysus in his bull form, as god of fertility, with which his phallic emblem is perhaps associated (J. E. Harrison, Prolegomena, 432 ff.). Oppert (675 f.) asserts that the Dravidians were originally adherents of the Sakī, or Mother-worship, and indicates any evidence to show that these same people worshipped the linga, or the organ of generation; and even at the present day we cannot point out any aboriginal tribe, which has retained intact its national customs, as revering the Phalus. This assertion is probably an over-statement of the facts. As we have seen, most of the Dravidian tribes combine with the worship of the Mother-goddess that of her male consort, and the mimetic celebration of the union of the divine pair suggests erotic rites. Hislop has collected a long Gond epic which tells of the creation and adventures of their hero, Linga. But, as he says, this has obviously been compiled under Hindu influence, and cannot be regarded as embodying the real traditional lore of the Gonds. At the same time, it suggests that lingam-worship was familiar to this tribe, and with them, in the form of the tiger, it was combined with animal-worship in the personification of their deity, Visvakarma (ib. i. 188). With this may be compared the worship by the Sudhas of Bengal of their goddess Khambé-wari, who is represented by a peg (Riley, Tribes and Castes, i. 68).

36. Other stone-worship among the Dravidians. —Stone-worship appears in other forms among the Northern Dravidians. Thus we find the worship of caims. The Bhils of Rājputāna erect on the hill-tops, to the memory of the spirits of deceased relatives, caims of stone, on which they place rude images of the horse, burn small oil lamps, and sometimes hang pieces of cloth. Goats or male buffaloes are offered here, and the pottery horse-figures are made with holes through which the spirits of the dead are supposed to enter, and then travel up to heaven, when the horse is presented to the deity (Bannerman, i. 53). Conical hillocks of stones are often found in the plains of the local gods, and are known as Deorālī, a title also applied to one of the Himalayan peaks (Kirkpatrick, 60). In Mirzapur, in the United Provinces, the hero Vānkalā Bīrī is represented by a form of stone, the Arod, to which every traveller adds one as he passes by. The hero is now on the way to promotion, as the offerings at his shrine are taken by a family of Brahman priests (N. V. Q. i. 40).

Secondly, we find special worship of particular stones. In all the villages of Central India are stones known by the names of Motī Mātā, 'pearl Mother,' or Lālābī Phānlī, 'the red flower Mother,' which are worshipped when cholera appears. The Bhil barāda, or medicine-man, officiates; he cuts off the head of a goat, and offers it with some lemons, copper coins, eggs, flowers, etc., in a piece of a broken earthen pot, while a toy cart, apparently used as a vehicle for the goddess, is placed beside the stones. When the head of the goat has been offered, the barāda takes up the potsherd and places it on his head. A watchman takes a living goat, an attendant carrying a pot full of country spirits, which drops slowly out of a small hole in the bottom of the jar. Behind this the car of the goddess is drawn by a third officiant. The procession is directed towards the famous shrine of Onkārnāth, and suggests that the barāda is a substitute for another goddess, Sātī Mātrā, 'Mother of truth.' Here the jar and carriage are left, and by this means the spirit of cholera is supposed to be enticed away beyond the limits of the town, by the aid of her chariot, and attracted by the goat and spirits presented to her (Luard, i. 78). This primitive method of disease-transference illustrates the Animistic character of the cult. In some cases the stone, which is the home of the deity, is replaced by pillars of wood, blackened by constant offerings of oil and butter. Such are the representatives of Bīrnāth, 'hero lord,' worshipped by the Ahrīv castes as a protector of their cattle. The worship of the Ahrīv is a worship apparently identical with the cultus of the group of deities known as Bangaramā, Bangārā Bīl, or, in her Hinduized form, as Devī, who are worshipped in various parts of India (Hislop, 15 f.; Crooke, Tribes and Castes, i. 63 f.). This pillar-worship takes various forms. Sometimes we find a stone pillar (lātī) appropriated to the hero Bīrnas, who is probably in origin a Dravidian deity, but is usually associated with the hurling hero of the Mahābhārata epics. The Gonds worship him in the form of a shapeless stone covered with vermillion, or of two pieces of wood standing on the ground, like those of Bangaramā. Among the Naikās, one of the Gonds, he is represented by a huge
stone rising out of the ground and covered with
vermilion.

In front of this, Nalkūdā Gosāna trees with Bai Gosāna and Kālāsā in acts of adoration. The order of the religious services seems to be as follows. At 5 p.m., having cooked a little rice, the worshipper bares his head, and all the gods are identi

fied with the Sun; deities of Nature, like Marang Buru, the mountain-god, and Jair or Jhur Erā, goddess of the sacred grove; besides a separate group of family-gods, arranged in two divisions—the family-gods, and the Abgē-bonga, or secret god (Rāle, Tribes and Castes, ii. 282). The other more Hindustani tribes have in the same way developed deities with special functions, like Dīprātī Dēo with his wife Angārnati, the war-gods of the Kharwars of the Kaimūr range, and Zorbā Dēotā, a god of hunting (Nāg, iv. 36, 77).

38. Theogonies.—Some of the North Dravidian tribes have framed elaborate theogonies with legendary accounts of the creation of man and of the dispersal of the tribes. Thus the Mundās tell how the self-existent primeval deities, Otē Bōram and Sing-bēngō, or the Moon-god and his spouse, have given to them the art of love, and placed them in a cave to people the world (Dalton, 185). The Khandi legend of the struggle between Bārāhā Pēnni, the Supreme Being, and his sister, Tari, the Earth-goddess, which ends in the creation of man and all other living things, is more elaborate, and has probably been embellished by the vivid imagina
tion of the natives who supplied Macpherson with his information (Memorials, 84 ff.). The Good legend of the birth and adventures of Linga has already been noticed (§ 35). Among the more advanced and Hindustani tribes, legends of this kind seem to have almost entirely disappeared, overlaid by the traditions connected with the Hindu gods, who have gradually displaced or absorbed the tribal deities.

39. Sacrifice.—The theory underlying the prac
tice of sacrifice is, according to the well-known but not universally accepted theory of Robertson Smith, the desire to attain communion with the god by joining with him in the consumption of the flesh of the victim or the fruits of the earth offered at his shrine. In the modern view of the Dravidians, however, it is purely a business transaction, do ut des, an arrangement that, if the god fulfills the desires of the worshipper, he will receive a sacrifice in return. Totemism (§ 25), has almost completely ceased to influence the popular beliefs, and it is thus impossible to trace the steps by which, if it ever had a general rule among the people, the clan totemism was developed into the methods of sacrifice which are in use at present. Here, too, as is the case with all their beliefs and rites, there is no literary evidence of any kind to assist us. There is, however, some scanty evidence to prove that the modern custom may have a totemistic basis. Thus the Parayali of the Kaimūr range hold the goat in great respect—a feeling which among the Pālōo and Chāndā, the chief of the bird’s clan, is worshiped to avert an epidemic of cholera. The goat is not sacrificed,
but released as a scape-animal (Crooke, *Tribe and Caste*, vi. 180). More significant than this is the rule that after sacrificing the flesh of the animal must be consumed by the worshipper and his clanmen, then and there, in the immediate presence of the deity, following the Vaishnava, the Misrah, Shaivite, or the Earthling traditions of the Dravidians (Jovons, *Introduct. 145 f*). In fact, as was the case in ancient Israel, all slaughter is equivalent to sacrifice (Robertoott Smith, *Rel. Semites*; 241, v. 279) it may be noted, is also the Hindu rule, and many of those who indulge in meat use only that of sacrificed animals, following the rule of Mann (*Institutes*, v. 31) that meat must be eaten only on occasion of sacrifice. The Dravidians are specially careful not to share the sacred meat with strangers, or even with members of their own tribe outside the inner circle of relationship.

40. Methods of sacrifice.—The methods of sacrifice differ among the various tribes. In the more primitive form the ritual is crude: the Gōlās of Bengal turn a pig loose amidst a herd of buffaloes, which are encouraged to gore it to death (Nath, *Travels*, 7). We occasionally find among the northern tribes the habit of tearing the victim in pieces, as in the Gond sacrifice to Ṣāgheēvar, the tiger-god (Dalton, 290). This points to an original habit of eating the flesh of the fallen victim, which survives, in some of the Greek mysteries and the practices of the Bacaeus, and appears among the southern branches of the tribe, where a lamb is torn to pieces by a man with his teeth (Bulletin Madras Museum, ii. 265). At a Devi shrine in Gorakhpur the pigs to be offered are brought to the temple with their hind legs tied; and, the throats of the animals being half cut with a blunt knife, they are allowed to bleed to death before being staked (*X. V* v. 122). The Tiya of Bengal, like many of the other menial castes, when they offer a goat to Kālī at the Divālī, or feast of lights, do not decapitate the victim, but stab it in the throat with a sharp piece of wood (Wise, 395). The ordiary method, however, is by decapitation.

In Northern Bengal the usual shrine of Kālī consists of a heap of earth, generally placed under a tree, with a stake to which the head of the victim is fastened, so that the neck may be stretched out for decapitation (Buchan, ii. 749). The Gorkha custom of sacrificing buffaloes, by one, or at most two, vicomnents of the family eyes, or Newārs, or aborigines of the country, who allow the animal to bleed slowly to death, is very cruel and very disgusting (Oldfield, *Sketches*, ii. 346 ff.). Such was also the custom of the Bāumī of Chotā Nāgpur at the Binda-parab feast. Two male buffaloes were driven into an enclosure, and on a raised stage adjoining and overlooking it the Bāumō and his family priest discharged arrows at the victimes.

41. The times of sacrifice.—No special time is appointed for the Dravidian sacrifices. At the more important festivities of the Mother-goddess the victims are slaughtered throughout the day and night. In some Greek shrines it was the custom to slay the victim at night and consume the flesh before the dawn (Pausanias, ii. xvi. 1. x. xxxvii. 4). This was also the rule among the Arabs (Robertson Smith, *Rel. Semites*; 282). For the Hindu śāspit sacrifice, in which the victim, as the name implies, seems to have been pierced with a spike or lance, the time was fixed after midnight; but some authorities preferred the dawn (Rajendralal Mitra, *Indo-Aryans*, i. 384; Jovons, *Introduct. 146*). This rule still prevails among the Prabhās of Western India, who at marriages sacrifice a goat to the family-goddess. In some families the rite is done at midnight on the day before the marriage. The goat is brought into the room and made to stand before the image. One of the wives of the family eyes, or the eldest forward, washes the victim's feet, sprinkles red powder on its head, and, after waving a lighted lamp round its face, retires. The eldest man in the household, or a banbe, proceeding to the image hall, slays a handful or two of rice in it before the goat, and, taking a sword, stands on one side. While the animal is eating the rice, he cuts off the head with one stroke, holds up the head, lets a few drops of blood trickle over the image of the goddess, and then places the head on a metal plate under the seat of the deity (*BG* xviii. pt. i. 195). At the shrine of Bechārj in Baroda the victims are slain at dead of night, in order not to grieve the feelings of Brahman and others (*ib*. vii. 614).

42. The self-surrender of the victim.—The feeding of the victim before sacrifice is probably a means of propitiating it, and suggesting to it is a willing victim. When the Raṭūlās of Bengal sacrifice an animal to Bar Pahār, the mounain-god, the victim is given rice to chew, and is decked with flowers before being slain (Riseley, *Tribe and Caste*, ii. 293). At the worship of the Mother-goddess, Bechārj, when a buffalo is brought for sacrifice, red powder and flowers are sprinkled over the animal, and it is worshipped. A white cloth is thrown over its head, and a cluster of flowers, removed from the image of the goddess, is hung round its neck. A
lamp filled from one of those burning in the shrine is brought lighted from the inner room and placed on the stone altar in front of the temple. The buffalo is then let loose, and if it goes and smells the deceased is considered to be obsequious to the Devi, and is slain at once, if possible by a single stroke of a sword. A blood-stained flower is presented to the deity, and the bystanders apply some of the blood to their foreheads. The blood is believed to be a preservative of health, and even the Brāhmans preserve cloths dipped in the blood, as charms against disease. If the buffalo refuses to smell the lamp placed on the stone altar, it is taken away, after one of its ears has been cut and a part of the blood offered to the goddess on a flower (DG vii. 614).

A more common method is to test the victim by pouring water on it, which was a custom in Greece (J. E. Harrison, Prolegomena, 625). When the Thags did sacrifice to Devi, their patron goddess, they used to place on a white sheet the consecrated pickaxe and knives used in their murders, with the sacrifice (like the goat), two goats were selected, black and perfect in all their parts. They were bathed and made to face the west; and, if they shook themselves lustily to throw off the moisture from their bodies, they were considered acceptable to Devi. If only one goat was found to be acceptable, if neither did so, it was a sign that Devi had rejected both, and the party ate the rice and drank the spirits. But this was regarded in the light of a simple meal, and the sacrifice was postponed to another occasion. When the sacrificial feast took place, the skins, bones, and offal of the victims were thrown into a pit, and they were regarded as so sacred that none but a Thag was allowed to see them (Thornton, Illustrations of the History and Practice of the Thugs, 1837, p. 63 f.). The rule that the victim must shake its head in token of acceptance is also found in the Panjāb (Rose, i. 118).

43. Variety, sex, and colour of the victim.—The rules as to the variety, sex, and colour of the victims are not very clearly defined. The animals most commonly sacrificed are buffaloes, goats, pigs, and fowls. The Bhils of Khandesh show their complete divorce from Hindooism by sacrificing a bullock to their gods Hātīpāwa and Vāghākān Kunvar, the 'tiger lord,' while their other deities receive a he-goat or 'Gow' as the special fowl (BG xi. 95). The Kanjar gypsies of the United Provinces offer a pig to Nathiyā; a lizard to Māṅk Gurr; a goat to Devī; a pig to Jakhōyat; and a fowl to Mata Crook. Tribes and Castes, ii. 147). The Mundas offer a male buffalo to Desvāll, their village-god, and fowls to his consort, Jāhīr Būrīl (Risley, Tribes and Castes, ii. 103). But this distinction of victims seems to be exceptional.

The colour of the victim offered to the chthonic and malignant powers (like the Greek σφυξίως (J. E. Harrison, Prolegomena, 661)) ought to be black. When the forest tribes of the Kaimārī range offer sacrifice to Chped, a malignant female deity, it should consist of a black she-goat and a black fowl; Banaśi, the forest-goddess, is less actively malignant, and is honoured with a grey or spotted goat (NINQ i. 57). Among the Marāthas, fowls with ruffled feathers are peculiarly acceptable offerings in cases of disease, and if a cock be sacrificed it should be able to crow (BG xi. 34). Following the same laws of symbolic magic, the Kāsias and Khyamias of Bengal offer a white cock to Jōrām, the Sun-god (Dalton, 132, 141).

44. The head of the victim.—The head of the victim is universally regarded as sacrosanct, as was the head (Robertson Smith, Race Semites, i. 379). Among the Dravidian tribes it is sometimes, when severed, laid upon the altar of the deity in whose honour the sacrifice is being made, but more usually it is the portion of the priest (Dalton, 142; Crooke, Tribes and Castes, i. 8). The Biātes of the United Provinces, who pretend to be Brahmo-Hindus, practice the curious rite of sacrificing a pig to the village god, and this being done by a low caste Chāmār ojā, or medicine-man, who cuts off the head, buries it deep in the ground, and appropriates the remainder of the flesh (Crooke, Tribes and Castes, ii. 773; Rose, i. 133). It has now been commenced in paying

45. Commutation of animal sacrifice.—The animal sacrifice is occasionally commuted in deference to the humanitarian ideas of the Vaiṣṇava and Jain sectaries. In one form of the rite, slaughter of the animal is replaced by merely cutting the ear, letting a few drops of blood fall on the ground or upon the altar, and then allowing the animal to escape (Rose, i. 120). The same custom probably in part explains the rite of letting loose a bull (vyūrāsarga), when devotees release an animal in sacred cities like Benares or Gaya, or when a young animal is branded with the trident of Siva, and released in this manner to the gods (see ANCESTOR-WORSHIP, vol. i. p. 452). The more primitive form of the rite was to slay the animal, with the object of providing food for the spirit of the deceased. This rule is still in force among the Thugs, and they kill another calf on the grave, and hang up the tail of the victim on the grave-stone, as evidence that the funeral rites have been duly performed. In default of this, it is supposed that the spirit is unable to rest, and returns to haunt the survivors (IA i. 348 ff.).

46. The scape-animal.—The animal sacrifice, again, is commuted into the scape-animal, with the addition of the belief common among the Dravidians, that it is the ‘vehicle which carries away the collected demons or ills of a whole community’ (Frazer, GB ii. 101). This rite is most commonly performed as a means of removing epidemic disease; e.g., in the United Provinces during an epidemic of cholera, a buffalo bull is marked with vermilion and driven beyond the village boundary, thus taking away the disease with him. When the idea is still further worked out by Brāhmans, it develops by painting the beast all over with lampblack and smearing its forehead with vermilion, to represent the ‘vehicle’ on which Yama rides, or for the chariot of the goddess (BG ii. 147). Thus, as the chariot more effective, the scape-animal is loaded with pieces of iron, as a potent protective against evil spirits (NINQ i. 102, v. 116).

47. Human sacrifice.—Human sacrifice was, as is well known, common among the Dravidians, and the best illustration of it is derived from the Kandh (q.v.) rite of mariaš sacrifice. Probably most of the rites of the same kind performed by the allied tribes were done with the same intention (Crooke, PR ii. 167 ff.). As was the case in Greece, we find survivals which indicate a commemoration of the rite (Lang, Myth, Ritual, and Religion among the Vedics, ii. 116 f.). Thus, at Nāsik in the Deccan, when cholera appears, a woman of the Māṅg, a menial tribe, is solemnly led out of the city as a scape-victim. She remains outside the city limits till the next day, when she lathes and returns. This ceremonial, which resembles that of bringing a victim to a shrine, doubtless implies an earlier rite of human sacrifice (BG xvi. 521). Another rite resembles that of the self-immolating pilgrim, used in former times to fling themselves, in the name of Siva, over the cliff known as Bhairava Jhānp, near the famous shrine of Kedārnāth in the lower Himalaya; this seems to have prevailed farther west in the hills of the Panjāb (Atkinson, ii. 773; Rose, i. 133). It has now been commuted into paying
for the services of a bādi, or rope-dancer, who slides on a rope suspended upon a cable attached to a platform or a cliff, the service of a priest, or a worshipper with a banner, to offer prayers to the deity, is also a common duty. In some Kamaun villages (YINQ i. 55, 74 f., 129, iii. 265). In the form of the Bihunda rite the same custom prevails in the Tamang district of the Hooghly. (Bose, ii. 133.) In many parts of the Eastern Himalayas to the higher altitudes of the Vidy Deo, the tiger-god, a man is covered with a blanket, bows to the image, and walks round it seven times. During this performance the worshippers slap him on the back, and are then expected to eat something. Then they set out to the forest as if pursued by the children, who liling balls of clay at him, and finally bring him back, the rite ending with feasting and drinking (Dalal, i. 156).

48. Periodical sacrifices.—The main tribal sacrifices of the Dravidians are not, as a rule, performed annually, and the victims sometimes vary from year to year. The Mundas sacrifice every second year a sow, every third year a ram, every fourth year a buffalo, to their mountain-god, Marang Buru, and the main object is to induce him to send favourable rain (Dalton, 199). The Tipperas have a legend that their king, Sri Dharma, enjoined that human sacrifices be offered only triennially (ib. 111). This rule of triennial sacrifices is followed by the Kharwaras, Cheros, and Nagbansis, while the Kura offers a sow yearly to the tribal Sat, and a black goat every third year (Bhugol, 53; Bhushan, 152; Dalton, 139, 137, 138). There are other instances of feasts celebrated at intervals of more than a year, such as the Theban Daphnephoria and the Boeotian Daphnées (Frazier, Panamanas, v. 41, G 32 i. 225 f., iii. 228 f.). Those which recur at intervals of eight years seem to be based on an attempt to harmonize lunar and solar time, just as the twelve years' feasts in South India may roughly represent Jupiter's period of revolution round the sun (Angipudi, 204 f.). But it is difficult to suppose that considerations such as these could have influenced people in the state of culture possessed by the Northern Dravidian tribes. It is possible that, in some cases, considerations of economy and the cost of providing the necessary victims may have suggested the rule that the sacrifices should take place at intervals longer than that of a day.

49. The priesthood.—It is said of the Kurkās of the Central Provinces that they have no priest- hood, by class or profession, and their ceremonies are performed by the elders of the family (Central Pr. Gt. 53). But, although many of the North Dravidian tribes the domestic worship, including that of deceased ancestors, is performed by the senior member of the household, or by the house father. But practically all these tribes have reached the stage of possessing priests. The term 'priest,' however, does not usually define with accuracy the functions of this officiant, the duties of medicine-man, sorcerer, exorcist, or witch-finder being generally combined in a single individual or class. Thus, at the Mundā rites in honour of Desauli, the village patron god, the sacrifice and offerings are made by the village priest, if there be one; if not, by any of the men who possesses the necessary legendary lore (Dalton, 196). Among the Malās of Bengal the village headman acts as priest in the worship of Dharmer Gosain (Ridley, Tribes and Castes, ii. 57).

The priest, again, among the Kandas is often identified with the shaman.

The priesthood may be assumed by any one who chooses to assume the functions of this officiant, and is not asceticism being authenticated only by the claimant's remaining for a period varying from to twenty years (ib. 110). In a lugud, dreamy, confused state, the consequence of the absence of his third soul in the divine presence. And the ministry which may be assumed by him has few exceptions, he lies down at pleasure' (Macpherson, 103).

Their jannis, or priests, he goes on to say, are divided into two classes—

one which has given up the world, and devotes itself exclusively to religious offices; and one which may still engage in every occupation excepting war. The former class are disposed to hold that they are entitled to greater deities; but the two classes pass irresistibly into one another, and many of both are seen to perform every ceremonial, with two exceptions, namely, the village sorcerer, sacri- ficer, at which a great and fully instructed priest alone can officiate; and the service of the Vidy Deo, which the priesthood alone can conduct. And this god, it is to be observed, requires that his priest shall serve him only, while all the other deities accept divided service from their ministers' (ib. 104).

The 'great jannis,' or ascetic who has given up the world, can possess no property of any kind, nor money, nor, according to his rules, even look upon a woman; and he must generally appear and act as other men as possible. He must live in a filthy hut, a wonder of abomination. He must not wash but with spittle; nor leave his door, save when sent for; except perhaps, when he wanders to draw liquor from some neglected hamlet, the foot of which he may he bound, if required, lying half drunk. He scarcely ever wears a decent cloth or blanket. He commonly carries in his hand a broken axe or bow, and has an excised, stilted, sleepy look; but his ready wit never fails him in his office. He eats such choice morsels as a piece of the grilled skin and the feet of the sacrificial buffaloes, and the heads of the sacrificed fowls; and, when a door is cut up, he gets for his share perhaps half the skin of the head with an ear on, and some pieces of the heart.

The layman priest, on the other hand, has a wife and family, and may accumulate wealth. He eats apart from other laymen, but may drink with them (ib. 104). These statements must be accepted with some amount of caution as Macpherson, relying on information received from his native subordinates, was inclined to a more elaborate system of beliefs and ritual to the Kandas than the tribe probably ever possessed.

Among the other tribes of the same family this ascetic class of priest does not seem to exist, though, of course, the diviner or witch-finder often adopts the shamanistic tricks which are the common property of his kind. Macpherson also records the singular fact that some Hindus were employed by the Kandas to assist in the service of the minor deities.

This alone would indicate that there has been a great change in their religion; but it is probable that the hindus alluded to are the Daha or sorcerers from the witchcraft superstition has called into existence' (Dalton, 236).

50. Priestly titles.—Along the Kaimūr range and in Chota Nāgpur the tribal priest is known as the bāgi (Macpherson). Among the mon- ized tribes he is known by the titles of pāhan (Skr. pradhāna, 'leader') or pujārī, 'one who does the service of the gods,' both titles being borrowed from the Hindu. But among without a bāgī, and such is the superstition of the people, that they would rather leave a village than live without him. Usually he is a member of one of the non-Aryan tribes, and is generally selected from those who live in the more remote tracts, and who, not being contaminated by Hindu beliefs and culture, are supposed to have the most accurate knowledge of the evil spirits, and the modes of placating and repelling them. In the more civilized villages in Pālamūnī, Forbes found that even Brāhmans and Rājputs were being occasionally appointed to this office—a sign of the progressive process of the village from an essentially Hindu yoke. The bāgī is looked up to with awe by all the residents, is responsible for the appearance of disease in man or beast, and is bound to offer up the sacrifices necessary to repel it.

He is supposed to be better informed about the concerns of the village than any one else, and to be able to point out each man's tenure. Among the jungle tribes he is invariably the arbitrator in all disputes pending to be adjudicated by the claimant's remaining for a period varying from ten to twenty years (ib. 110). In a lugud, dreamy, confused state, the consequence of the absence of his third soul in the divine presence. And the ministry which may be assumed by him has few exceptions, he lies down at pleasure' (Macpherson, 103).

Their jannis, or priests, he goes on to say, are divided into two classes—

one which has given up the world, and devotes itself exclusively to religious offices; and one which may still engage in every occupation excepting war. The former class are disposed to hold that they are entitled to greater deities; but the two classes pass irresistibly into one another, and many of both are seen to perform every ceremonial, with two exceptions, namely, the village sorcerer, sacrifice, at which a great and fully instructed priest alone can officiate; and the service of the Vidy Deo, which the priesthood alone can conduct. And this god, it is to be observed, requires that his priest shall serve him only, while all the other deities accept divided service from their ministers' (ib. 104).
The official among the Goonds bears the same name.

The nuptial, funeral, and similar ceremonies are performed under the head of aged relations. But generally in every village there is a man who is supposed to have the power of charming tigers and tigers' blood and other potions are administered to those suffering from drought, cholera, etc. He is called a Bagis (USSR, 1890, p. 271).

The pahan of the Cheros and Khawarás, and the layá or náyá (apparently a corruption of Skr. nágvá) (leader) of the Kóra, exercise similar functions (Dalton, 120; Risley, Tribes and Castes, i. 609).

53. Appointment of priests.—In Chotá Nagpur, according to Forbes (VINQ iv. 5), the office of priest is hereditary;

but in the event of the becoming necessary to appoint a new

Bagis, a meeting of the entire community is held, and the suc-

cessor is appointed by vote; the individual selected is then

called on to accept the post, and, in the event of his declining,

day is fixed for the ceremony of installation. On the appointed
day the whole village community meets in solemn concourse;

the village headman presides, and the proceedings commence

by his calling upon the candidate to state publicly whether he is

willing to accept the office, and the success of the ceremony

will be entirely dependent on whether he will be found

to perform are explained to him. He is then conducted round

the tuns of the village, the different landmarks of which are

explained to him. The whole party then proceed to the

place of meeting, when the president, taking up the Bagis's

inam or ulus, in which are known the knife and dagger,

solemnly hands them to the new incumbent, and the

following ceremony is repeated:

These ceremonies include the presentation of sacrificial

knives, and are repeated in the formal manner described to each successive Bagis, and

are used solely for the purpose of installing him. In the villages where under hindu

influence these hereditary implements of the Bagis seem to be

frequent, they are used.

In other cases a special ceremony is performed to ascertain the will of the local deity regarding the appointment of his priest. Among the Baiga on the lower slopes of the Himaiyá, as one of the greater hindu festivals, the villagers bathe, and, parading some weeks after, the drinking-cup, the shrine of the

local god, invoke them. ‘He who is chosen is miraculously rap-

ed or inspired by the god, and, taking up the cup, he is able to
discern the future’ (Crooke, i. 252). Although it contained nothing but

t. The Deotá (goddess) may also declare his pleasure in this

matter by imbuing one of his votaries with the power of

thrusting, unharmed or unmarked, an iron rod through some

portion of his flesh. It is the custom in one village to ask the

Deotá from time to time after the death of his priest whether

he wishes a successor appointed. The image is raised upon the

shoulders of the people, and, if the god presses heavily to the

left, the wishes the election postponed; if to the right, he

wishes it to take place without delay’ (PSQ 1.12).

Similar ceremonies are performed by the other Dravidian tribes. Among the Mangils, the pahan is always selected from among the descendants of the earliest settlers in the village, who alone understand how to propitiate the local gods. He is always selected from one family, but the actual pahan is changed at intervals of three to five

years, by the rite of the sacred winnowing-fan—

mystica wunus lacoOi. This is taken from house
to house by the village boys, and the man at whose

house it halts is elected; the same method of selec-
tion prevails among the Orsöns (Risley, Tribes and

Castes, ii. 106 f.; Dalton, 247).

52. Priestly tabus.—Among the Malars the
dándana is appointed by Divine election. After

his call he must spend a certain time in the

wilderness, in intimate communication, as his

flock believes, with the deity, Beo Gosam. From

the time of his appointment he devotes himself to

the priestly profession, and his hair is allowed to grow like

that of a Naziri, because his powers of divina-
tion entirely disappear if he cuts it. The cutting

of the hair of a holy man is, as Frazer shows (GBS

L. 262), dangerous to two reasons; first, there is

the danger of disturbing the spirit of the head,

which may be injured in the process, and may

revenge itself upon the person who molestes him;

secondly, the breaking of the shorn

locks, which may be accidentally injured, and

thus, on the principles of sympathetic magic, may

endanger the original owner, or may be used

by some evil-minded person to work black magic

against him. After admission to full orders the

Malær priest must establish his ability to foretell

events, and

he must prove by the performance of some stupendous work

beyond the strength of one man, that he is supernaturally aided

by the Supreme Being. The priest may be a married man, but

after entering orders he must henceforth have no sexual

relations with or touching any woman except his wife. Having

undergone all the tests, his ordination is formally timed by the

Mangil (headmen) of the village, who ties a red silk thread to

which cowries are attached round his neck, and binds a torban on

his head. He is then allowed to apprise his tribal of the

ceremonial sacrifice of buffaloes celebrated by the Mangil in the month of

January, and must drink some of the blood of the victim

(Dalton, 270).

Another interesting tabu of the Dravidian priests

is that enforced at Žindá Kášin in the Panjab,

where they are required always to sleep on the

ground or on a square bed of grass made on

the ground between four posts. This reminds us of the

Hellori or Seldi, priests of the Pelasgian Zeus

of Dodona, who sleep upon the ground and have

their feet unwashed, and of the Prussian priests

who sleep in tents near the sacred oak (Hom. H.

xiv. 234 f.; Sophocheles, Trach. 1167; Rose, i. 118 f.; M. xx. 36).

53. Renunciation of priests.—The methods of

renouncing the Dravidian priest vary. Usually

he supports himself on the head of the victims

and portions of the other offerings which are his

perquisite. In the case of the Mangils among the

Munda tribes, the religion of rent-free land, and among the other tribes he

receives gifts of grain and other produce at harvest
time, and food at the chief tribal feasts.

54. The sister’s son as priest.—The fact

that inheritance among many of the people in the

North India is traced through the female has been held to

indicate the prevalence of polyandry in ancient
times. ‘It was probably wide-spread amongst many tribes in other parts of India, but the present day retain no tradition of the practice’ (Risley-Gait, Census Report, 1901, i. 448). This is specially shown in the case of those tribes among whom the sister’s son does sacrifice to appease the spirit of the deceased. Thus among the Háts of Bengal a pig is sacrificed on the tenth day after a death to appease the spirit of the departed, the flesh being eaten by the relatives, while the nephew (sister’s son) of the dead man officiates as priest; and the same is the case among the Dom (q.v.), Musahars, Pasis, and Tantis of the same province (Risley, Tribes and Castes, i. 316, ii. 167). Among the Kovás, another of the United Provinces, if the services of a Brahman cannot be secured, the sister’s son of the deceased can officiate; the Bhiyars hold him in great

honour, and make periodic presents to him as the Hindu do to a Brähman; and in the case of the Dom as in Bengal, he is the funeral priest; among the Kols the marriage rites are performed by the same

relative (Crooke, Tribes and Castes, i. 93, ii. 95, 925 f., iii. 309; Dalton, 83). This primitive form of priesthood is almost certainly a survival of the

matriarchate. A record of the struggle between the matriarchate and the patriarchate has been traced in the Brahman legend, which tells how Tari, the

Earth-goddess, contends with her consort, Búpa Pénú. The latter is finally victorious, and as a sign of Tari’s discomfiture imposes, as in

the Semitic story, the cares of childhood upon her sex (Maeshil, 14 ff.).

55. The aboriginal priest adopted into Hinduism.—The process of adoption of these aboriginal priests into Hinduism has been clearly traced in the Central Provinces by Russell (i. 170 f.). Here the

class of village priests consists of doctors and astrologers, the

joshi, joyé, jangam, and his fellows, occupy for the

lower castes the position which Brähmans hold in the

higher strata.

They are the descendants of the more primitive form of

religion—that of the village gods. In many cases their ritual

has probably been derived from a Dravidian source, and they
DAVIDIANS (North India)

themselves may be the prominent descendants of the tribal priests, or witch-finders, for witch-finders are now for the most part employed in the service of the Hindu gods, and this is probably a kind of religious evolution, of a less tribes; and, moreover, different authorities have held that a shrine, which represents a great retrogression from the purer nature gods of the Vedas, have been derived from Davidian sources.

56. The jot tribes.—Further, we find among the Davidian tribes that certain castes, possibly in imitation of the Brahman Levities of Hinduism, have become specialized for religious purposes, and function as priests to the Village Provinces. The Vaishnavas of Manbhum and Western Bengal act as priests of the meaner tribes.

Their offices as priests of the various spiritual powers that haunt the forests, rocks, and fields and bring disease upon man and beast are in great request. A Bhumij or a Knmi who wishes to propitiate these dual-conceived but potent influences will send for a Maulnik to offer the necessary sacrifices in preference to a Lay or priest of his own caste—a fact which speaks strongly for the antiquity of the settlement of the former in the country (Bisley, Tribes and Castes, p. 82).

The biaga (g.v.) caste in the same way provide priests for the Goons; and the Harijanized Provinces, the Paturi branch of the Kajhirs, who perhaps, take their name from the paf, or sacred plateau, which gives a deity to the Kuris, Kurkis, or Munias, act as priests of the whole tribe, and take, like the Harijan of the Vikramshetra, the share and other goods of the dead man, by wearing or using which they are supposed to pass them on to the next world for his comfort. Hence they are held in such contempt that their parishioners will neither eat with them nor drink water from their hands (Crooke, Tribes and Castes, iv. 153 ff.).

57. The merial priesthood in the Plains.—Among the merial tribes and castes of the Plains the Vilag collection is performed by priests drawn from the very lowest ranks, Bhangi, Dosidih, Mal, or barber; while the semi-Hinduized tribes of the Kaimur range generally employ a Chero or Dhuma. Nor are their services confined to members of the tribes which generally employ them. Women even of high caste use their services in worshipping those local gods, whom the innate conservatism of their sex inclines them to propitiate side by side with the higher Hindu divinities. In time of stress, when famine, disease, or other trouble besets the village, all classes of the community employ them to perform the blood sacrifices and diverse ceremonies of propitiation, which they themselves do not understand or are unwilling to perform.

58. Promotion of Davidian gods into Hinduism.—Writing of Greek religion, Campbell (Religion in Gr., Lt., 1888, p. 46) remarks that the reaction of primeval local ceremonies upon the Aryan religious deposit is one of the many causes of the infinite variety in the popular cults of deities reverenced throughout Greece under the same name.

‘People at an early stage of culture,’ he says, ‘are too entirely steeped in the awe and reverence which has descended to them from their forefathers to adopt readily any new type of worship coming from abroad. The initiative fault is active and the features of the new religion, but the inherent force of that religion will always prevail over such subjects, which begin with are but imperfectly understood.’ They remember elsewhere (p. 45), ‘as an undergrowth when the tall trees of the forest were felled.’

The survival of these deities among a race of heathen is the kind of relics that are generally wor- shipped them is further encouraged by the fact that they are to a large extent the impersonations of the awe and mystery of the forest, or the malignant manifestations of the primitive Mother-goddess. A new race occupying an unknown land is naturally inclined to insist on the conciliation of those local powers, which, if neglected, are likely to visit them with their displeasure. The Aryan form of Animism was not in its nature different from that of the Davidians, and hence the accept- ance of the local cults presented no difficulty. The spirit of Hinduism has always been catholic, and it has always been ready to give shelter to foreign beliefs, provided it was permitted to assimilate them in its own fashion.

‘The homely jungle hero,’ says Lyall (Asiaitic Studies, i, 50), ‘comes eventually to get bred in rank among regular divinities, wherever his tribe is promoted into a class of Brahmans are prone to deny the existence of this pro- cess, and to protest that those of the people from which should be understood as only voluntary on their part, and merely superficial; they would be willing to keep their Olympus and classic and even the heads of some of their lowest Brahmans have to, and is not troubled by any such fine scruples, to he illustrate the rude Ogos and Mink (now Aryans of the Jungle) as fast as they come to him for spiritual advice, sets them up with a few decent caste prejudices, and gives to their rough untutored superstitions some Brahmatc shape and vivacity. This is vxevia to the refined Vedantists of the towns, but the same thing goes on everywhere; for a lofty orthodoxy will not attract ignorant outsiders, nor will it keep the mass of a people within a common outline of belief. So the high and mighty deities of Brahmanism would never draw upward the peasant and the woodswinner who were not invited to bring with him his fetich, his local hero or sage, his werewolf and his wicca, all to be dressed up and interpreted into orthodox emanations. In one part of Bengal the Minks (an aboriginal tribe) used to worship the gaw of the earth and the spirits in the mountains, which were turned towards Ixian, they changed their pigs into a saint called Father Adam, and worshiped him as such; when the Hindus got a turn at them the pig became identified as the famous ‘Boar Avatar of Vaisnava, whose name is Varaha.’

This account admirably explains the process by which these local gods are accepted into Hinduism.

A few examples may be given of Davidian gods promoted in this way. The cases of the Bhairon, Ganesh, and Hinnman have been already referred to (§ 29 ff.).

‘A deliberate goddess of the Bhils, who under Hindu guidance was re-named Laksmi, goddess of prosperity, gained the title of Sitala Maa, the smallpox goddess, whom the women of the village-gods are supposed to have worshiped under the name of Macpherson tells how, when the Hindus occupied the Kandh country, they took over the local goddess, Kandhini, and, joining in the aboriginal worship at her shrine, her worship became practically confused with that of Durga, but it is still discharged with regularity and pomp by this joint ministry’ (Calcutta Rev. v. 88).

The adoption of the Hindus of these aboriginal gods is often masked by a sageness, which, if an image was accidentally found, and the agency by which it is said to have been recovered is often that of one of the men of the non-Aryan tribes. This tale is told of the famous image of Jaganath, which is said to have been recovered of the aboriginal tribe of Savaars. Bull (580) describes how a Kand found an image said to resemble that of a cat, which is now recognized as that of Narsinh, the ‘man-lion’ incarnation of Visnu. Often the image or image is said to have been discovered as the result of a dream. One of the most famous liqaga in the Central Provinces was recovered in this way, and the same tale is told of an image of Kryao in western India, of the great ‘tanka’ at Mewar, and quite recently of an image that on the seashore near Bombay (BG v. 81; Tod, i. 242; NINO £. 175). The same inference may perhaps be drawn from the fact that the most valued by modern Hindus are those known as nonpusumh, that is, existing spontaneously and of their own nature pervaded by the essence of nature. They are mere rough stones or rocks supposed to have descended direct from heaven, or to have appeared miraculously on a hill or by the side of all objects of creation, and, when discovered, temples are built over them. The most usual object of this kind of stones are supposed to represent the Ligua of Siva, or the idols are built round them, a Yoni (to represent the female organ) is usually added (Morier-Williams, Brahmanism and Hinduism, 69).

These Davidian local gods seem to have supplied much of the coarser elements of modern Hinduism—the lascivious blood sacrifices of the belief in the occasional immolation of human beings, the use of
spiritsuous liquor in the service of the gods—all of which appear in the Sákta cult, the most degraded form of which was the case in Greece, where 'it must be remembered that the cruder and wilder sacrifices and legends ... were strictly local; that they were attached to these ancient temples, old altars, barbarous zones, or wherever they could be received. In reality, holding the Pausanias found the most ancient relics of Hellenic theology' (Lang, Myth, Ritual, and Religion, i. 282ff.).

Draavidian feasts and festivals.—The Draavidian feasts may be roughly divided into two classes: (1) those celebrated at the chief agricultural seasons—ploughing, sowing, harvesting—the object of which is to promote the fertility of the soil and the growth of the crops; (2) those intended as a means of purgation, the periodical expulsion of the malignant spiritual powers which menace the community. The line, however, between these two classes of festivals cannot be clearly drawn, and the ceremonies of one occasionally merge in those of the other.

When the hot weather has passed, with the first fall of the monsoon and the first important feast-time, the Eroh Sim feast, when he crowns the blessing of the Mother-goddess who presides over the crops, by making a sacrifice of chickens in her sacred grove. This is followed by the Haurar Sim, 'the feast of greenery, the sacrifice made to secure the favour of the gods (Bradley-Birt, Indian Up-land, 278 f.). At the transplanting of the rice the Rain-god is again invoked; and at the critical period when the success of the crop depends upon abundant rain, the Chhat-praor, or 'umbrella feast,' is held. It is a form of rude mimetic magic.

A long thin tree trunk of its branches supports the smallest of umbrellas roughly made of gandy tissue, and together, amidst the excited shouts of the celebrants, they are raised aloft until, standing perpendicularly, the hill trunk is fixed firmly in the ground. As it slowly settles into place, the presence, gathering up handfuls of dust and earth, pelts the umbrella with loud cries and much laughter, dancing round it as white as round a maypole, while the men then sorcerously perform wonder of abstinence and acrobatic skill. Copies drinking of rice beer brings the feast to a close' (ib. 290f.).

Finally, when the rice is in ear and the season of harvest approaches, the Jathonai feast, or offering of first-fruits, is performed. Tiny sheaves of the half-ripe corn are placed in the sacred grove upon the sacrificial stone, and prayers are made to the gods that will permit the crop to be safely reaped and garnered. The sacrifice of a pig, the flesh of which is cooked and eaten in the grove, is an essential part of this feast (ib. 291). The corn, as Frazer suggests, is eaten sacramentally 'as the body of the corn-spirit' (GB² ii. 318 ff.). This round of Santal feasts may be taken as specimens of those performed by the Northern Draavidian tribes, further accounts being reserved for the articles on Mundás, orions, and others.

An example of the second class of festivals— the purgation feasts—is to be found in the Maig-praor or Damalanga of the Mundás. A sacrifice is made to the village-protecting deity, Desan. At this period an evil spirit is supposed to infest the locality; and, to get rid of it, the men, women, and children in procession come through the village, the sticks in their hands as if beating for gane, singing a wild chant and vociferating violently till they feel assured that the bad spirit must have fled; and they make noise enough to frighten a legion' (Dalton, 290 f., 196 f.).

An important part amongst the mental castes of the Plains, among whom, after the Doovali, or feast of lights, the house-mother takes a sieve and a broom, and beats them in every corner of the house. (Cf. Aryan and old Brahmanic ritual.)

These feasts have been exhaustively discussed by Frazer (GB² iii. 39 ff.).

The lights used at the Doovali feast are probably intended as a means of expelling evil spirits. Among the Pávras, an aboriginal tribe of Khánsé, at this feast four or five stones are brought from a neighbouring hill and placed outside the houses, but within the village lands. They are painted red, liquor is sprinkled on the ground and freely drunk, and goats and fowls are sacrificed. Dancing begins at nightfall, and, with the lighted torches, goup branches are thrown to house followed by the villagers. Every housewife comes out with a lighted lamp in her hands, waves it before them, marks their foreheads with the lamp oil, and gives them food. In this way every house in the village is purified (DG xii. 100). Further south it resolves itself into a means of purifying the cattle. After feasting, a figure of Balindra, god of cattle, is made and hung up in the cowshed, with rice and coco-nuts tied round its neck. The cattle are decorated with splashes of colour and garlands. The heaviest bull and the swiftest heifer in the herd are covered with flowers, and driven through the village, followed by a crowd of shouting youths.

60. The Holi.—The most interesting of these Draavidian festivals in North India is that of the Holi, known further south as the Shimga. The chief part of the rite is the burning of the Holi fire, the primitive custom, which is probably due to a sort of sympathetic magic to ensure a due supply of sunshine for the crops (Frazier, GB² iii. 313 ff.). But there are other incidents which suggest that the festival in its present form is complex, and that more than one train of thought has led to its observance. Returning to that primitive tribe, the Pávras of Khánsé, we find that a pit is dug, and a wooden stake thrust into it, and lighted at night. Every one brings a piece of bread, some rice, and a cock, portions of which are thrown into the fire and the rest consumed on the spot. Drinking and dancing go on till dawn (DG xii. 100). In Kurnútan each clan erects a tree covered with rags which are begged by the young men from the people of the tribe. Near the tree a fire is kindled and the tree is burned. While it is being burned there is a contest between the clans, each trying to carry off a sheaf of cloth from the tree of another clan.

When the tree is consumed the people leap over the ashes, believing that in this way they get rid of itch and other diseases. The analogy with the custom of hanging raggs on trees is abundant. In Gwalior, again, two phallic figures are constructed. One, made of wood, is preserved year to year; the other, of bricks, after the fire is lighted is broken to pieces with blows of shoes and cudgels.

The wooden figure is placed beside the wedding couch as a fertility charm (NING iii. 92 f.). A similar rite is the Khatphivuit of Kurnútá, when a fire of dry grass and weeds is burned round a pole. Obscene songs are sung, and the purport of one is that the cattle are now safe from demons (ib. iii. 135). Among the Draavidian Býürs, again, a stake of the sacred cotton tree is driven into the ground, and a time is fixed for the destruction of Old Year. The fire is lit by the village báigá, and the people after parching ears of barley at it eat them. They sprinkle the ashes about, and with them mark their foreheads (Crokke, Tribes and Castes, ii. 12). An important part of this is the leaping over the fire and the driving of the cattle through it, which Frazier (GB² iii. 312) thinks 'may be intended, on the one hand, to secure for mankind a share of the vital energy of the sun, and, on the other hand, to purge them of all evil influences; for to the primitive mind fire is the most powerful of all purificatory agents.' Further than this, we find that, in the
ceremony as performed in the Madura district of the United Provinces, the important portion of the ritual indicates that the representative of the community, should walk through the fire not in a perpendicular way, but in a manner which seems to imply that he was expected actually to lose himself to the flames. A similar rite practised by the king of Tyre seems to represent the consummation of an actual fire sacrifice (Frazier, Adonis, Attis, Osiris, 38; Crooke, Pl ii, 317). The Holi, then, appears to be a combined chief institution aiming to promote fertility and dispel evil influences.

61. The Satnalia.—It will have been noticed that in connexion with festivals of this kind there is a period of licence, which may be compared to that of the Roman Satnalia. The Māthaparab, or spring feast of the Munda, is held in January, when the granaries are full of grain, and the people, to use their own expression, fill of destiny. They have a strong notion that at this period men and women are so overcharged with vicious propensities that it is absolutely necessary for the safety of the person to let off steam by going for a long, full vent to the passions. The festival, therefore, becomes a saturnalia, during which servants forget their duty to their masters, children their reverence for parents, men their respect for women, and women all notions of modesty, delicacy, and gentleness; they become mad diwale (Frazier, 1893).

In the same way the rites of the Holi festival are accompanied by indecency of word and gesture, the singing of ribald songs, and the flinging of filth or coloured water on passers-by. Such orgies are commonly associated with the rites of the spring festival or the purging of the corps (Frazier, GB3, iii. 118 ff., 138). It seems more probable that these acts of indecency are intentional as a piece of sympathetic magic to induce fertility, than, as Crawley (Mystic Rose, 1902, p. 278 ff.) suggests, a means of purification and breaking with the past by a complete inversion of the normal, decent course of ordinary life.

62. Hunting-festivals.—The last group of the Dravidian festivals which can be considered here is that of the general hunt. In Chotā Nagpur the Hos, as well as most of the other non-Aryan tribes of the district, have a great national hunting-festival in May. Immense crowds assemble, beat the forests, and kill enormous quantities of game (Burn, p. 107 ff.); Among the Rājputas this is represented by the annual spring rite of the Akārīna, when the boar, the enemy of the Mother-goddess, Gauri, is slain (Tod, i. 598 ff.). Frazier connects this slaying of the boar with the ancient Indian Hāmarkūr. This general hunting-festival, again, seems to develop into the Munda rite, when all the girls of the village arm themselves, and make a descent upon a neighbouring village, whence they carry off all the live stock, in the shape of fowls, kids, pigs, and lambs, which they can secure, the village thus railed retaliating by a similar raid upon another; and in the Pfins, in Hidār, at the Jīr Sital feast in honour of Sītal, the smallpox goddess, the people in the forenoon cover themselves with mud, which they shower on every one they meet, and in the afternoon go out with clubs and hunt hares, jackals, foxes, and any animal they can find in the village (NINQ, iii. 98; Grierson, Bhār Poushant Life, 401). The import of these rites is obscure. They may be connected with the totemistic slaughter of sympathetic animals, as in the case of Hunting the Wren; or they may be purificatory or catarrhal (FL xi. 230 ff., xxi. 270 ff.).

63. The current religious beliefs of the peasant.—I propose to consider the general views of the so-called Dravida peasant of the United Provinces on the subjects of religion and morality. This question was specially considered at the last Census, and much useful information has been collected.

Beginning with the Pānjiā, Wilson, a careful observer (Sirsā Settlement Rep., 1883, p. 133), holds that the ordinary Hindu peasant of the Pānjiā has practically no system at all. He has a vague idea that there is a future life, in which those who are good in this world will be happy in a heaven, while those who are bad will be sent to a hell; this he considers as a punishment for his various sins against the gods, demons, saints, and goddesses. He is in a hurry to avert temporal evils or to secure the blessings of the spirit world. In order to improve his prospects in the world to come, he has an idea that sin will bring evil upon himself and his fellow in this life as well as after death. His idea is that the good and evil deeds which he reaps in this life will be rewarded in the next. The ordinary European moral distinctions, only they do not take so wide a range. Instead of extending to the whole human race, or to the whole nation or sect, they extend only to his tribe, or village, or family. He thinks it wrong to tell a lie unless perhaps he thinks it a relative of his is involved in it. He thinks it wicked to injure a man unless he has been injured by him, or to cheat another unless he thinks that other would cheat him if he got a chance; or to take a bribe without giving the promised consideration for it. He has a vague idea that it is good for him to meditate on the deity; and, to show that he has not forgotten him, he musts the name of Śaṅkā, or of some other Hindu god, when he rises in the morning, and, if it is piously inclined, at all times also, in season and out of season. Notwithstanding all the numerous saints and deities whom he endeavors to imitate, he has a vague belief that above all there is one Supreme God whom he calls Nārāyana (Nārāyana) or Parasurāma (Parashurama), who knows all things, and by whom all things were made, and who will reward the good and punish the bad both in this life and in the life to come.

Fagan, writing of the neighbouring district of Hissar, remarks (NINQ, ill. 129) that the peasant is in no sense an orthodox Hindu. He feeds and venerates, though he does not respect, the Brahman; and he acknowledges the existence of three great Hindu gods, Śiva, Viṣṇu, and Śaṅkū. Of the more strictly orthodox, but inferior gods, perhaps Sūtra Nārāyana, the Sun-god, is the one most commonly worshipped. His worship consists in bathing at the temple on the morning of the fasts, in burning, in some temples, obesience, and pouring water over the śingam of Śiva. He worships Sūtra Nārāyana on Sundays; and the more pious fast on that day in his honour, eating one meal, and abstaining from the use of salt. But these gods are too great for every-day use. 'He lives, as it were, in an atmosphere charged with the spirits of departed saints, heroes, demons, and others who are in a position to, and as a matter of fact do, exercise a benevolent or malevolent influence in the affairs of mankind, and it is from them that he selects those who are to be the recipients of his every-day devotion. It is as a matter of fact so much the more to his advantage to worship them with fixed ceremonies as he does Śiva or Sūtra Nārāyana; but they are always conscious of almost present to him as the beings who have the most immediate connexion with his own destiny.' In the Dravida Provinces of Hīndustān, the Earth-god, and Śītag, the goddess of smallpox, are most commonly worshipped. Fire he adores by dropping butter into it; he worships the Pīpal, or sacred fig-tree, at dawn, after bathing, by pouring water at its root and making obeisance.

Burn (1783 ff.) corroborates the existence in the United Provinces of belief in a Supreme God, called Bhāgvan, Paramesvāra, Śiva, or Nārāyana.

* * *

A cultivator in Bundelkhand thus described his religion to Lard (i. 64): 'All I know about religion is that every day we call Rāma, by whose grace we live. All my life is taken up with work. I do not do things which would outrage me, associate with the low, or eat forbidden things. This is all my religion.' In other words, religion amounts to observance of the ten commandments.

DRAVIDIANS (South India)—I. Introductory.

The Southern Dravidians, numbering about 57 million of people, occupy the portion of India that is bordered on the north by a line which, south of the Western Ghats, runs along the foothills of the Western Ghats to Kolhapur and Hyderabad, then passes south of Bareilly to the Bay of Bengal on the east. The term ‘Dravidian,’ irrespective of boundary, is generally used in the sense applied to it by Kurnarla Bhattacharya in the 8th cent. (about AD. 725 ([Ioreen, Hist. of India, 1905, p. 70]) to include those southern peoples who then spoke languages he termed ‘Andhravardī,’ or ‘Telugu’ (‘Telugu’ (Telugu) which are now divided, as chief languages, Telugu, Tamil, Kanarese, Malayalam, and Tulu. Many attempts have been made to connect this group with other outside families of India such as the Chadic, the Ateic, and the Australian; but so far as any conclusive evidence is concerned, the attempt is now generally regarded as a failure (Linguistic Survey of India, vol. IV, p. 292). The same conclusion seems to have been arrived at with regard to efforts made to connect the Southern Dravidians with other known races of the world, or even with those of North India. Recent head-measurements in South India have led Thurston (Castes and Tribes of Southern India, vol. I, p. xli) to the conclusion that whatever may have been the influence which has brought about the existing sub-brachycephalic or metacephalic type in the northern areas, this influence has not extended southward into the Tamil and Malayali cians, Dravidian nations have been relatively isolated in their own cultural centers. It follows that there is no reliable evidence whether the Southern Dravidians are autochthones, or whether in some primitive time they reached their present habitats from some outside country. In South India they were preserved, almost down to historic times, from the outside social and ethical influences of Aryan, Scythian, or Mongolian stock which overwhelmed the Aryo-Dravidian races, which spoke some proto- Dravidian language. The barrier of the Vindhyas range of mountains warded off for long the pressure of these other groups of more advanced civilization. The Southern Dravidians have, therefore, preserved their own indigenous language, diversified in course of time into distinct groups of separate languages. In these languages—Telugu, Kanarese, Malayalam, and especially Tamil—a literature was developed in a peculiar classical form, so archaic and different from the spoken language of to-day that the modern educated Southern Indian would now be unable to read or understand this early literature, unless he made it a special study. It enshrines somewhat of the early history of the social organization and religious conceptions of the pre-Aryan period.

To the east and west of the Vindhyas lay the low coastlands, through which, in due course, Aryan and other newcomers penetrated, settled in the richer river-valleys, and thence advanced through the more accessible passes to the central table-land. These incursions were comparatively late in the lifetime of Dravidian peoples. It is not until the 4th cent. B.C. that mention is made in Aryan literature of the Southern Dravidians. The grammarian Panini in the 6th cent. B.C. merely notes the existence of the Andhras, who ruled in the Telugu country in the north-east of Dravidian lands, and who, from the account of Megasthenes, held an extensive sway south of the Maurya empire as early as 300 B.C. Katyayana, the commentator of Panini, in the 4th cent. B.C. also mentions the Telugu-speaking inhabitants of the Dravidian kingdoms, which had their capitals at Madura and Uraliyar (see being Dravidian for ‘village’ or ‘town’). The Edicts of Asoka in the 3rd cent. B.C. show that the south was then a land of which the kingdoms mentioned above, and that of the Cheras on the east. Asoka records in these Edicts that he had conquered the Kalingas as far south as the Kistna River, and killed 100,000 of the inhabitants—which he regarded because in such a country dwell Brahmanas and ascetics, men of different sects (V. A. Smith, Asoka, Oxf. 1901, p. 16). The publication of these Edicts as far south as Mysore ‘presupposes a widely diffused knowledge of the art of writing’ (V. A. Smith, Early Hist. of India), do. 1905, p. 154). Intercommunication had so increased by the time of Mahendravar, a relative of Asoka, that he is said to have instilled Buddhism as far south as Ceylon (see Dravidian Brahmism).

In the history of religious life—so far as it is of permanent interest—the Southern Dravidians, it is almost impossible to discriminate exactly between what was the original concept of the religious conceptions and what was of purely indigenous origin. Buddhism in India loves to work through analogies, and an analogy may be found in the Aryan influence in the south; but so far as it affected the higher classes and their literature.

The aboriginal Dravidian was of short stature, of dark skin, with a short broad nose. The Aryan—at least the early Aryan ethnically influenced by the aboriginal races, of whom the pure Brahman is the best type in India to-day—was of fair complexion and had typical Aryan features. In South India of to-day—between a Brahman of high culture, with fair complexion and narrow nose, on the one hand, and an isolated Dravidian, on the other, there is a vast difference, which can only be reasonably explained on the assumption of racial admixture; and it is no insult to the higher members of the Dravidian community to trace, in their more lowly brethren, the result of crossing with both the dark-skinned and broad-nosed race of short stature (Thurston, op. cit. vol. I. p. liv).

This mixed Dravidian and Aryan can be traced all over the south, more marked as one goes northwards, and in the north it is even more predominant. The same mixture of Aryan and Dravidian can be traced in the literature of the religious life of the people, so far as it is a record of their best thought. There is throughout it an underlying Dravidian substratum, interwoven and covered over with, sometimes almost
concealed by, accretions from Aryan culture. Just as Dravidian languages, from their contact with Aryan languages, were saturated with a new vocabulary and their literature enriched by new modes of expression, so, in a similar manner, Dravidian primitive religious conceptions were refined from dark superstitions and Animism, until they finally reached a living faith in the saving grace of a Supreme Deity. The primitive Dravidian substratum has been described as a form of shamanism (see preceding). This phase of thought and practice existed in India among the wilder tribes and simpler rural folk, who have their own peculiar ecstatic frenzied dances, amid which the votaries, drugged and foaming at the mouth, are held to be in communion with some demon or godess, and to become soothsayers of the deity thirsting for unholy rites and blood sacrifices. Out of some such phase of thought emerges the pre-historic primitive Dravidian religion, known as some form of Saivism, or worship of Siva. The attributes and rites of this deity were gradually brought into conformity, by a process of compromise, with those of some Aryan deity or deities. The conception thus grew of a half-Dravidian-half-Aryan deity—Rudra-Siva, the Destroyer of the Universe—who became the Supreme Deity, Siva, of the great mass of the Dravidian people. The term Siva is even used in the Vedas as "auspicious"—an epithet of the god Rudra. The word Siva is, however, the Dravidian word for 'red,' and the word rudra in the Rig Veda 'often seems to mean red.' Therefore, at a very early period, it seems probable that the conception of the god Rudra had a tinge of Dravidian ideas (Linguistic Survey, iv. p. 279).

This tinge of Dravidian runs through all Dravidian literature of post-Aryan periods in which the religious ideals of the people were expressed, giving it a distinctive and often perplexing individuality of its own. Dravidian influences had, no doubt, a predominating effect alike on the literature, the religious conceptions, and the philosophic modes of reasoning of the Dravidian. Nevertheless, Dravidian genius, roused by contact with an advanced civilization, developed a distinctive individuality not only to stand side by side with the best of the literature of India, but also to take a place in history as a contribution to the records of the efforts and aspirations of mankind towards truth.

Evidence for the influence of early Christian beliefs (see E.B. ii. 548 ff.) on later Dravidian religious conceptions belongs more especially to that branch of Dravidian thought that is called Saivism. This feeling seems to have impressed itself most strongly on European scholars, who may be said, by their intimate acquaintance with Indian languages and literature, to be least estranged with the spirit and thought of India (see Grierson, 'Modern Hinduism,' chap. xiv.); and it has from this angle been taken (e.g., J. A. F.A.S., April 1907; Pope, Intro. to Tiru Vichakam). The theory of this

1 There is no pure Dravidian word for 'faith.' The Skr. word dhati is used (=Tamil pattu) in Tamil literature as early as the 15th cent.

2 Sanskrit forms of Tamil words are used throughout, as belonging more properly. The Tamil method of pronouncing the Skr. sri, 'blissed,' is retained, as it is of common occurrence.

2 Early history of Dravidian religion.—Tradition ascribes the earliest Aryan influences on Dravidian religious literature to the Acharyans, whose writings were usually in Sanskrit, and were translated into the vernaculars for the use of the common people. The Kural, a collection of couplets, in the Venag metre, on ethical subjects, is especially claimed by the Acharyans as their contribution to the earliest efforts to provide the Dravidian cultivators of the soil with moral teachings. This claim seems improbable; the work is more usually ascribed to a weaver named Tiru Valluvar, who lived at St. Thomé, near Madras. It is said to have been accepted by the 3rd Saṅgha, or Tamil Academy, at Madura, through miraculous intervention of the god Siva to establish the revealed character of its stanzas. Divided into three books, on Virtue, Wealth, and Enjoyment, it is still considered by Tamil-speaking people as a masterpiece of literary structure and of profundity of thought, and was praised from many European scholars. It has been ascribed to the 2nd or 3rd cent. (Barnett, Catalogue, p. 111), but its style is simple—far more so than works ascribed to a much later period.

The same famed Tamil Academy is also traditionally held to have been responsible for the gathering together, at the court of the king of Madura, of 800 Jain ascetics, who issued a collection of 400 quatrains (Avvāru) to serve as a Tamil Veda, or Book of Wisdom, for the daily use of the people. These quatrains are said to have been composed 4000 years ago, but, as a matter of fact, date back, at the furthest period to which they can be assigned, to the 2nd or 3rd cent. A.D. In the outpourings of the soul—tossed from birth to rebirth through the evil of deeds—over the weariness of life and the joy of release from ceaseless transmigrations, there is no evidence of any distinctive school of belief, either Jain, Buddhist, or Saiva, and no mention of a deity. One quatrain alone (243) gives a faint clue to the existence of a difference between northern and southern faiths, by stating that 'many of the southern people have entered heaven (svaragam), while many of the northern have lived in vain; the future of every one depends on his own deeds.'

In these early centuries Jainism and Buddhism flourished throughout South India side by side with the rising claims of Saivas. From the farther south to the southern people into one common national faith, founded on the belief in a personal deity able to enter into communion with his votaries. From the beginning of the 1st cent. (A.D. 20) to the beginning of the 3rd (A.D. 218), the Buddhist faith flourished vigorously, especially in the Telugu country. Here, under the rule of the Andhra-Būryas, the famed Buddhist tope at Amaravati, near the Krishna River, was built. This great Buddhist memorial is now in ruins, and the surrounding country desolate; but in the neighbouring hills are cut out rock-hewn caves, once the abodes of ascetic monks, who must have wanderer far and wide, inciting the faith of their founder and beggar alms.

The Jainist negation of the belief in a soul and Buddhist negation as to the existence of a personal Deity were soon both exploded. The two religious philosophies which these doctrines were in the south from the sources of their birth in far-away Kapilavastu, 200 miles north of Benares. The great revolt of the Dravidian races against both Jainism and Buddhism in the 5th and 6th centuries, and continued until the indigenous deity Siva was left supreme. The land of the Dravidians became henceforth the land
of a belief in a First Cause, who by His grace created a cosmos wherein souls might work out the fatality of "karma," or deeds, and so gain release from the bonds of the successive births and re-births, the uncertainties of awards in heavens or hells.

An account of South India, seemingly authentic, at this period is given by Hiuen Tsiang, a Chinese pilgrim, who travelled all over India to trace the footsteps of Buddha and to learn the condition of the Buddhist faith. It is recorded that this visit took place in A.D. 640, in the reign of the Western Chalukyan monarch, Pulikeshin II. (A.D. 608 to 642), who ruled at Vatsyapi, and is said to have conquered the Southern Pallava monarch, Narasimha Varma, who ruled (A.D. 625 to 645) at Kâñchi (Conjeeveram). The Chinese pilgrim describes Kâñchi as a city five miles round, containing many Jains, 10,000 Buddhist monks, and 80 Brahmun temples. At Mâlâkâtya (country south of the Cauvery) he records that the people did not care to date from A.D. 800, or give any occasion for gain. He says that the country possessed many ruins of old monasteries, but that only the walls were preserved. There were many hundred Deva temples, or the temple of Siva. He also describes one Buddhist stûpa, or burial-mound, "in the Chola country, and another in the Dravida or Pandy kingdom, as ascribed to Aśoka" (V. A. Smith, Aśoka, p. 47). From this it is clear that the coming struggle was to be between the advancing power of Saivism as opposed to the Jain belief and the fading influence of Buddhism. There is further external evidence in the great classical Tamil romances—the Maritamkâlatam, and Silappadikârikaram—of the 2nd cent., that at that period Buddhists, Jains, and Saivas lived in harmony, whereas the third great Tamil classic—the Tirukkâtevam of the 10th cent., gives evidence of the hostility of both Jains and Saivas to the Buddhist faith.

3. Sacred hymns of the Saivas.—The revival of the Dravidian worship of Siva led to the collection of all the early Saiva hymns, composed for singing in the temples to Siva during worship, into what is known as the Tiru Murai, or Holy Sayings. The first three books of this collection contain the poems of the most renowned sage and saint of the Tamils, Tiru Jââna Sambandhar, of the middle of the 7th cent. A.D. (V. Venkayya, Tirumâti Antiqûrây, No. 3 (1906)), whose image is still worshipped in Saiva temples of the south. The next three were the poems of Tiru Sâmukâram, or Tiru Sâmukâram; and the succeeding seven—the last—those of Sundarar, of the 8th and 9th centuries. The poems of this collection, or Devâram, are held to be Divine revelation, and are daily recited, in Tamil lands in the Saiva temples, by a special class of priests. To this collection are further added, as the 8th part of the Tiru Murai, the poems of Mânikka Vâchakar, known as the Tiru Vâchakaram, or Holy Sayings, which date from A.D. 700 to 900 (J. Vinson, Sundârânta Dipika, Aug. 1908; V. Venkayya, Tamil Antiqûrây, No. 3, p. vi.). A ninth collection, by nine minor poets, is known as the Tiru Sûrîti, one hymn relating to a temple built by Jayendra Chola I. (A.D. 1012) (LI xxxvi (1907) 258). The 10th is by a mystic, Tiru Mûlâr; and an 11th contains some poems by Nakkirar Devar of the 4th or 6th cent. A.D. The last ten poems of this 11th collection, by Nakkirar; last three form the basis of a legendary History of Saints, which is known as the Periya Purâyanam, composed by Sekkharar, under the patronage of Kulottungas Chola II. (A.D. 1070-1118) (Sundarar Pillai, Milestones, p. 3; see Barnett, Catalogue, for a nine-fold collection of the Tiru Murai),

The collection of early devotional literature, together with the poems of fourteen later Santana teachers, are sometimes called the 'Sacred Sûtras of the Saiva sect.'

The 10th cent. is noted for the sacred Saiva poems of Paññanattu Pillai, while in the 16th or 17th cent., almost the floating legends concerning the many manifestations of the energies of Siva, were collected together as the Thirukolams of Siva, or Tiru Vâlaiyâdi Purâyanam, by Parâjî Joti. The most popular and sweetest singer of Saiva mystic raptures was Tûyâmnâvar, who wrote about A.D. 1650.

This period of revival of the adoration and worship of Siva exhibits, as an outward expression of the inward devotion of the people to their Deity, the bestowal of an almost incalculable amount of labour and skill on the erection in A.D. 985 of the famed temple at Tanjore, the walls of which were covered with inscriptions telling of the great victories of the Chola king, Kâjâ Kâjâ Deva (A.D. 985). In the time of the heretical Cjola king, Parantaka I. (A.D. 907), the temple to Siva at Chidambaram is recorded to have been covered with gold (S.I. Inscriptions, vol. I. p. 112).

The most famous of all these early poets was Tiru Jââna Sambandhar, who is said 'to have looked upon the overthrow of the Jains and Buddhists as the one objective of his life—of every one of his numerous hymns the tenth verse is uniformly devoted to their condemnation' (Sundarar Pillai, Milestones, p. 79).

He is said to have converted the ruling Pandyra monarch at Madura from Jainism back to the ancient faith in Siva, to which the monarch's wife and prime minister had adhered. The Periya Purâyanam records that not only did he convince the king of the truths of Saivism, and defeat all the arguments brought forward in support of Jain doctrines, but that he afterwards took care that 8000 Jains should be massacred—a massacre which is still commemorated at Madura. The second greatest of these early poets was Mânikka Vâchakar, the author of the Tirupp., who in the 9th cent. A.D. is recorded, in the Vâtakarûrûr Purâyanam, to have totally defeated the Buddhists, and to have finally established the Saiva faith in the Chola kingdom. The king of Ceylon is said to have arrived with his surrounding Buddhist missionaries at the court of the Chola monarch, who vowed to exterminate them if Mânikka Vâchakar could establish the truths of the Saiva faith in opposition to the arguments of the Buddhists.

It is strange that at this early period one of the keenest philosophical arguments against the whole underlying basis of Buddhist and idealism was raised by the Tamil sage. The Buddhists, in their arguments before the Chola king, stated the cardinal doctrine of their belief that all 'knowledge appears and in an instant of time disappears; all is ceaseless flux.' The answer of Dravidian India came in the retort of Mânikka Vâchakar, that in all thought, in all perception, there must persist a momentary consciousness, a moment of apprehension, which persisted in itself evidence of reality. The argument was urged by Mânikka Vâchakar, who asked how he could reply to a Buddhist who uttered madness, for,

"before than did the Buddhist utter forth the words and meanings, since than understanding must have passed away, what revelation of truth and virtue can there be?" (Pope, T.V. p. 96).

The Buddhists, after long disputations, had to confess and repudiate the answer.

"Thou sayest that we possess neither God nor salvation. What, then, is your God and your salvation?"

The best non-doctrinal answer to this question is to be found in Pope, T.V. of Mânikka Vâchakar, now available for English readers in the versified tr. by Pope. These 'Holy Sayings' are, in the words of the translator (p. ix, preface):

1. Hereafter cited as T.V.
2. Hereafter cited as S.D.
The Dravidians (South India) 

*daily recited in all the great Saiva temples of South India, are on every one's lips, and are as dear to the hearts of vast multitudes of excellent people there as the Psalmists of David are to the Jews.*

It is held that in South India the influence of these hymns was such that

> "by the 12th century both Buddhism and Jainism had become inert and dead" (C.S., July 1999; Nallaswami Pillai, Saiva Religion.

In these hymns, or devotional songs of mystical rapture over the works and grace of Siva, and telling of the ecstatic joy of release from the bondage of ignorance and bonds, Pepe saw everywhere the influence of the Bhagavat-Gita, the deity Siva taking the place of Krsna, the heroic deity of the Sanskrit poem (dating in its earliest form from 400 B.C. to A.D. 200).

The doctrine of bhakti, or faith in Siva, finds expression in the Saiva doctrine of the love and devotion of the soul to the belief and hope that Siva will, through his grace, grant knowledge of the soul's true nature, by which revelation of knowledge the soul would obtain release (mukti) from transmigrations. According to the Saiva Agamintta, either the position of the soul with regard to the grace of the Deity is helpless, in the position of a knower towards his mother, or the grace of the Deity seizes it and brings it into salvation—a doctrine known as marjuri-bhakti, or cat-like faith; and this has been described as the lowest (ai bhakti adhamah) form, for the faith to operate its securing salvation, being in the position of a young monkey grasping its mother—a doctrine known as markatavatnula-bhakti, or monkey-like faith, which is commended (S.D., Oct. 1910, Agamic note, P. 12).

Pope held that this doctrine of bhakti, or faith, permeated the whole after-history of Saivism in a form in which

> "the fervent adoring love and worship of Siva is represented as including all religion and transcending every kind of religious observance" (F. T. v. Ixxix).

It was left to Saivakaracharya, towards the end of the 8th or beginning of the 9th cent., to give the death-blow to Buddhism in the south, and to lay the foundations of a more widespread Saivism than its earlier forms. Born a Nambrthri Brhaman, in South India, at Mahabhar, he died at the early age of 52 in the Himalaya mountains, having crowed into a single book the tremendous outpouring of his genius and learning in commentaries on the Upanisads, Brahma-sutras, and Bhagavat-Gita, while a vast number of revivalist short poems, still recited in the south, are ascribed to him.

In these commentaries India saw its culminating point, in philosophic reasoning, in the doctrine he taught of adavitia, or non-duality—the Indian form of monistic idealism. The monistic doctrine of Saivakara, with its underlying principle of the fictitious maya, conjuring up an unreal cosmos of dream life, with an abstract subject of thought as ultimate entity, was too vague and idealistic to form a basis for a religion sufficient to satisfy the demands of the non-Brahmanical Dravidians for realism and personal worship and love for a Deity. Siva, therefore, admitted, as a preliminary to full knowledge of his adavitia doctrines, the worship of various manifestations of Siva, as avatars of the All-God, inculcating a more refined form of the worship, as opposed to the popular worship of the kris tea, or female divinities. He founded throughout India for Saiva monasteries and his immediate disciples established ten orders of Saiva ascetics to carry on the attack against the rival Buddhist monastic orders. The present guru, or spiritual head—thirty-third in succession from Saivakara—of the monastery he founded at Srirangam, in Mysore, is the acknowledged head of all the Tulu-speaking Saivites who adhere to the adavitia doctrine of Saivakara, which is still taught among Saivat Brhmanams in every considerable village in the south.

The spread of the worship of Siva was in the 10th cent. further fostered by the conquests by the Chola Saiva monarch, Rajaraja Deva (A.D. 985), of the ancient Chera and Pandya kingdoms and Ceylon, and finally the whole of south India became a united Chola and Eastern Chalukyan empire by matrimonial alliances between the two kingdoms. In the Decean a great revival of Saivism is recorded to have taken place in the time of Bhijala, a Jain who had usurped the throne of the last of the Chalukyan monarchs, Somesvara IV. An inscription, of about A.D. 1200, gives an account of how the deity Siva was "specially created in order to put an end to the hostile observances of the Jains and Buddhists" (Thurston, op. cit. iv. 239).

There is, further, a tradition that an incarnation of the bull—always associated with Siva as a form of his energy—was sent to earth in order to restore the worship of Siva, and that this incarnation appeared as a Kanarese Brhman, born near Bijjala, or Bijapur (Fleet, IA v. [1876] 230). Basava in due course had the usurping Jain, Bijjala, assassinated, after which Chenna Basava, the nephew of Basava, established the Kanare Saiva religion in his country. The Saivas there are known as Vira Saita, 'champions of Siva,' or Saiva Bhaktas, forming the sect of Lingayats, who wear the Bhagam and worship Ganad, the bull of Siva.

4. Vaisavas or Hindu reformers. The worship of Vignu, as opposed to that of Siva, was taught by Ramannajaharya, a Brhman born in the 12th cent. (Barnett, Bhagavagita, 1905, p. 55, says A.D. 1017), near Madras, became a convert of the Supreme Being, Visnu or Vasmdeva, as Cause and Creator of the world as a real objective existing cosmos, were inculcated, with the belief in soul as different from the Universal Soul. The doctrine taught respecting the Deity is that known as vidistadovidat, or qualified non-duality, in opposition to the earlier adavitia doctrine of Saivakara. The Suprme Deity, according to this doctrine, is both the highest and the material substance out of which it was created. Faith in this Deity became the centre of a revived Bhdgavatism. The persecution of Ramanuja by the Chola monarch, Kuleuttung or Rajendra Chola II. (A.D. 1070 to 1118), led eventually to the spread of these new Bhagavat doctrines all over India. This was not finally accomplished until the 14th cent., when a new southern teacher, Ramananda, brought up at St. Thomé, near Madras, became a convert to Bhdgavatism in a worship of Rama Chandra, an incarnation of Visnu, which he preached as a faith for the mass of the people. The contact of Aryan learning and Dravidian religious feeling thus led to a revival of Hinduism all over India, for from Ramanuja in the 12th century

> *were spiritually descended Ramananda in the 14th, and Viddapati and Chalasaya in the 16th—the three apostles of Vaiyogin in Hindstan, Behar, and Bengal* (Hoernle, Hist. of India, 93).

The chief followers of Ramanuja, known as Sdr Vayogin, are divided into two schools or sects

> —those of the North and those of the South, or Vada galei, and Ten galei. Both schools hold to the Vedas and Vedanta, the Northern school being more orthodox in its attitude to the Aryan revolotions. The Northern school, further, recognizes a male and a female energy in the Deity, and the...
DRAVIDIANS (South India)

25

1 strongly insists on the concomitance of the human will for salvation, whereas the Saivite school maintains the irresistible of Divine grace in human salvation' (Kenen, 1).

The two schools are thus—like the Saiva Agamic schools—divided on the subject of cat-like and monkey-like faith. The Southern school, in place of the Vedas, use their own canonical books of scriptures, consisting of 4000 verses of the Tanjil, known as the Nātiyāvā Prabhānām. These verses are ascribed to saints called alvat, held to have been incarnations of the Deity. These alvat are described as 'those drowned in or maddened with God love' (A. Govindachārya, From the Life of the Artārā, Mysore, 1926). The modern Bhāgavata doctrine of faith of the South school of the Sīr Vaiṣṇavas has been raised to sublime heights in the Artha Pañihakas of Pili Lokahārya (A.D. 1213), until this faith

...in its outward progress becomes more and more intense and rapacious. Instead of compelling it becomes inviting, instead of repelling it becomes bewitching. Effort is merged in craving. Self-assumption gives place to self-abandon. The heart has become poured into the intellect, or rather, the intellect has become fused with the heart' (tr. A. Govindachārya, J.R.A.S., July 1919).

The last great Southern apostle of Vaiṣṇavism was Madhavāchārya, born 1321 as a Saiva follower of Saṅkarā, who became a fierce opponent of the Saivas and of the advaita philosophy. He preached, in opposition, pure duality, or danta, holding that the Divine is composed of matter and the soul is different from matter, māyā, which he held to be real and eternal. The Supreme Soul of Being was by him held to be Viṣṇu or Nārāyana, incarnated as Kṛṣṇa, and salvation was held to be gained by bhākati, or love for Vāyu the son of Viṣṇu.

In the South Kanarese country most of the Telugu-speaking Brāhmans are followers of Madhva, and, as might be expected, most of the Dravidian Hindu classes are Saivas. At present a wide-spread revival of interest in Saivism is taking place in South India, which demands the close attention of all those interested in the future religious life of India, which seems destined to be influenced by the principle underlying the formulated doctrines of the Saivas. At a recent Saiva conference, held in 1909, at Trichinopoly, attended by Saivas from most of the Southern districts and even from Ceylon and Jaffna, it is reported that the proceedings were opened by the recitation of some verses of the Devadāsa and Pratāpa, 'which the Saivites like to call their Psalms.' The report further states that 'the Saivas at the close of the proceedings held a consultation on the subject of the different Saiva schools.'

The spirit of the present revival may be seen from the comments made on the report by the learned editor of the S.D. V. Y. Ramagan—first, to the eflfect that there were as many Brāhmans present 'as could possibly be expected in such strictly religious functions'; and, second, that 'the greatest Apostles of God whose teachings constitute the Saivaśārāvatsa Siddhānta were fort the most part Brāhmans, and they throw open the flood-gates of true spiritual life for all children of God.' A further significant fact in connection with this revival of interest in the history of the Saiva religion is the increasing use made by Saiva writers of Scriptural phrases and analogies. A knowledge of the formulated doctrines of the Saiva Siddhānta was an increasing necessity for all those anxious to understand or who are brought into contact with, the religious life of South India, which seems to tend towards a change in the direction of greater tolerance for surrounding religious beliefs, in the direction of purifying Saivism from the degrading elements contained in the grosser forms of Sakti-worship.

5. Formulated doctrines of the Saivas. The scholastic theological doctrines of the Saivas were

in medieval times set forth in metrical stanzas, with necessary commentaries for their proper interpretation, by a series of poet-philosophers held to have been spiritually descended from the first of these poets who received the earliest form in which they exist in South India, as a revelation from the Deity. This first form is known as the Sri Jiv Jñāna Siddhānta, or 'Apostles' Commentary on the Mahābhedā Theology' in South India. It was composed—or arranged—by Mey-kandar Devar, the Divine Seer of the Truth, in about A.D. 1225. Mey-kandar was followed by Mañju Śrī Śaṅkarā, the Sahkhara, who wrote the Saivasamānyā-neri, and whose disciple, the famed Kottavangudi Umāpati Śivāchārya, composed, in or about A.D. 1313, the Śiva-prakāśāna, or 'Light of Siva,' the Tīru Arut Payyānam, or 'Frucht of Divine Grace,' or the Śivākāya Nīvāraṇām. The S.J.B. of Mey-kandar is held to be the most authoritative of all these works, as being a direct revelation from Siva,

'the purpose of pointing out the way to proceed from the knowledge of the body full of sorrow to the knowledge of the soul and hence to the knowledge of the Supreme Spirit' (tr. Nallaiyanni Pillai, Madras, 1909).

It is a free translation into Tamil—in Aśīrīyam metre with a commentary in Venṭha metre—of twelve Sanskrit stanzas said to have formed part of the Saurṇaṇīya, of which Ayogha, or early works in Sanskrit incalculating the mystic worship of Siva and Sakati, there are said to be 28, now gradually coming to light, of which two have been translated. The Tamil stanzas of Mey-kandar are of such extreme terseness of diction and brevity of expression that even the ordinary Fundits are not able to understand them without proper commentaries, and very few Fundits can be found in southern India who are able to expound the text properly even now. Nallaiyanni Pillai, op. cit. p. viii.

Barnett has recently commented (J.R.A.S., July 1910)—and his view has been accepted in Saiva centres in Madras—that the formulated doctrines of the Saivas, as they first appear in the S.J.B., reached the Southern Dravidians from the north. His contention is therefore that the living faith of the majority of living Tamils is almost in every respect, and certainly in all essentials, the same doctrine that was taught in Kashmir about the beginning of the 11th century, by Ashhanka Gupta.

Both of these schools trace their roots to the Śvetācāra Upaniṣad, and points out that

...the elements of the Tanjil Saiva Siddhānta, the Sanskrit Ayogha, and the Saiva theology of Kashmir, are all contained in the Śvetācāra Upaniṣad, which was canonical long before the days of Saṅkarā' (S.D., June 1910).

These ideas of the Upaniṣad were in Kashmir formulated into the Śrīnivāsa and Śrīpratāpa-abhijñā schools, and, according to Barnett, 'meanwhile filtered down through various channels into the lands of the Dravidians, for whose ancient cults it supplied a theological basis.'

Whatever may be the final conclusion on this point, as to whether the formulated doctrines of the Saivas descended from north to south or ascended from south to north—for the Śvetācāra Upaniṣad and the various current schools of Indian philosophy, such as the Sañkhya, Yoga, and Vedānta, were in the 5th cent. equally well known in the south and in the north, and Sanskrit was used for literary purposes in the south as well as in the north—all the technical terms of the system and its essential features are contained in Saiva devotional literature of South India from the 7th and 8th centuries. These technical terms and essential features are—as set forth, towards the end of the 8th or beginning of the 9th cent., in Saṅkarā's Commentary on the Brahma Sūtras (li. 2. 37) —that

1 Hereafter cited as S.J.B. 2 Hereafter cited as S.P.
3 Hereafter cited as T.A.J.P.
4 A full account of the Upaniṣad is given by V. Y. Ramagan in his tr. of Appaya's Commentary on Vedanta Karika (Chidambaram, now being printed in parts).
The worship of the śiva and śiva is explained by intellectual Sāivas to be the worship not of phallic emblems, but of the representatives of the pillar or temple of the Deity, and various other ideas told of in the Brāhmaṇas, such as the pillar of fire in which the energy of Śiva appeared before Brahamā and Viṣṇu, to show his supremacy, so that thenceforth the worship of the Śiva has been inaugurated in the world. The pedestal (śiva) is Mahadevi, and the śiva itself is the visible Mahāvīra (T.P. T.V. 191).

(a) The necessity for creation.—There exists, it is held, an eternal necessity that a cosmos must be created, because souls, which never vary in number and are eternal, require a cosmos wherein to work out the result of karma, or deeds, which is also eternal.

The S.P., therefore, says that 'Creation is an act of grace; in the world alone souls are able to eat their food and to rid themselves of impurity and attain mukti, union with God' (Goodwill, S.D., March 1905, p. 145).

The underlying principle of this doctrine is that deeds, or karma, must be ripened before they can be eaten or consumed; and, as a place for this process of ripening is necessary, a cosmos must of necessity be evolved, and this evolution can take place only through the grace, or love, of Śiva. It is not until deeds of the past births, deeds of the present birth, and deeds of the enlightened done between enlightenment and final release are 'balanced' that final union of the soul with Śiva ensues. The T.A.P. (vi. 1) clearly states that it is not possible for release to take place until 'the unequal good and evil become balanced.' All deeds of man being an evil, and which becomes necessary that Śiva, through his grace, should evolve a Universe, at the end of each eon, for the benefit of the flock of souls who have not attained the balancing of their deeds and release in previous existences of the phenomenal Universe.

At the commencement of each eon 'the unconscious souls shrouded in that primordial darkness are responsible—in some inexplicable fashion—for the old, eternal deeds, the fruit of which must be consumed by each at the time of its maturity' (Tape, Śādānanda, p. 65).

The S.F., which of all the texts gives the clearest exposition of this Dravidian method of dealing with the soul's state of 'original sin,' does so by merely saying that it is the soul's natural state; that there is no assignable cause for it; that, while the Deity is the creator, the soul is the natural state, just as the cost of rust is natural to copper (Hosington, p. 149).

(b) Method and source of creation.—Absolute Intelligence being having been accepted by the Dravidians as the highest philosophical truth that could be extracted from surrounding current Yoga, Sāṅkhya, and Vedānta philosophies, it became necessary to bring this philosophic conception into conformity with the religious wants of the people. The ordinary intelligence of the Dravidian folk—whom it was necessary to enfold in Hinduism—demanded a beneficent Deity, all-powerful and all-gracious, willing and able to save the soul from the haunting terrors of transmigrations in higher and lower forms, the awards of deed, and a real Universe. Realism—the banner of the revolt under which the Dravidian intellect fought against Aryan thought as it came to be conceived and, as a result, the so-called advaita, or non-duality, of the philosophic conception of Śiva had to become graduated down till it became what is virtually a form of dvaita, or non-duality.

The stages of reasoning by which this transition is graduated could hardly ever have appealed to popular imagination, or even to common intelligence. Sāiva philosophy, both to create the cosmological state as unreal, as the human product of universal māyā, and still keen to call its system advaita, or non-dualistic, was still reiterating the essential character of the cosmos and the object of creation.

The formulation of doctrines, as they first appear in the S.J.B., merely give the scholastic explanation of these terms, and teach the means whereby the middle term (in paśu paśu paśu), the 'bond,' or principal, could be annihilated, and so the soul, paśu, free from the fetter, may then unite with its Master, the Lord.

These formulated doctrines, so far as it has been found possible to extract a consistent account from conflicting interpretations, are as follows:

i. ŚIVA, THE EFFICIENCY CAUSE OF CREATION.—A First Cause is postulated from a principle of effect and cause. According to the S.J.B., because the Universe is seen differentiated into forms known as 'he, she, and it,' and undergoes changes of devotion, continuation, and invocation, it requires a First Cause; just as, when one sees a pot, a cause—the potter—is required. This First Cause is not however, reduced to the dualism of Sankara—One only without a Second—where the cosmos is a delusion conjured up as a dream by an unreal mayā. The Śiva system is, nevertheless, held to be necessary. He may be found on strict non-duality. Śiva is, accordingly, the Sole Cause, without any other co-operating deity such as Brahamā or Viṣṇu, the Brahamānic Creator and Preserver, for 'we cannot find out cause for ultimate cause.' See Saiva Femen (modern cætheism). Śiva stands supreme; all the deities of later Brahamanism are merely of the nature of highest souls, dependent on Śiva to carry out his discretion. It is by the source from which the cosmos is energized throughout its course of creation, preservation, and invocation. He is never the object of thought, he remains only pure Subject. He is neither spiritual form, nor he formless (S.P. iv.).

Almost the first—the ever repeated—verse of the Kural declares: 'He has neither like nor dislike (desires nor non-desires). To the question, Has God form or no form, or is He both form and formless? we find the answer, 'He has all the above three and none of these' (S.J.B.). It is also declared that 'He is form and not form, but to those who know Him He has the form of knowledge' (T.A.P. iv. 1). He is also said to be 'uncomprehensible by the grossest, by His minutestions, by His great grace, and in the benefits He confers' (S.P. i. 1). No other spirit nor form, 'being Absolute Being (or sad) or pure Subject, he can never be the object of cognition' (Hosington, S.F. xi). The full definition of Śiva is, then: One, is, 'That which is perceived by the senses is a-sat (foot-Being) or Changeable, or is perceived not so perceived does not exist. God is neither the one nor the other, and hence called Śiva Sat (pure Being) by the wise, chit (pure Intelligence) or Siva, when not perceived by the human mind, and chit (Being) when perceived by divine intelligence' (S.J.B. vi.). He is, as transcendent Being, in inseparable connection with dispersions or higher energies, the atman, satkāta, of being, Intelligence, and Bliss, or Sat, chit, ānanda.

Notwithstanding these fundamental doctrines of the advaita nature of Śiva as Final Cause and Absolute Subject of Thought, he is, in one form or another, represented in the many Śiva temples. It is contended, by the modern Śaiva reformer, who sees that the 'worst feature of modern Hinduism is its idolatry' (Nalhawami, op. cit., Preface), that all these forms in temples are merely symbolic of some idea or thought respecting a Deity who actually remains formless. In popular imagination these transcendent forms are very abode of a deity, to whom food and offerings are presented for material enjoyment. The two idols to which popular Śaivism pays peculiar attention are—

1 Hereafter cited as S.J.B.
duality, had, nevertheless, to frame a theory to explain Effect from Siva, Ultimate Cause. To postulate matter (see Sānkhya) would have at once reduced the system to pure duality, inconsistent with Vedanta. Strangely enough, the Sāṅkhya was postulated merely the existence of an underlying basis of creation, an essence, a form of matter, elemental matter which was called pure (sūkta) matter. This pure or sūktic, or elemental, abstract matter, is held to co-exist with Siva eternally, producing differentiated spheres of action for souls. Pure māyā has, however, no connexion with souls, which are associated with an impure form of elemental matter (akin to the Sāṅkhya prakṛti) known as impure (asuddha) māyā. In this impure māyā inhere the malas, or impurities of souls—those of karma, or deed, and ātman, ignorance, the state or condition of the soul (ātman) (Tattva Kaṭṭālai, p. 14).

Siva, co-existing with pure māyā as an efficient cause of creation, is pure though (chīt), pure bliss (gaṇey), as postulates the Sāṅkhya, as well as having the dispositions or energies of desire (bhāva, action (kriyā), and knowledge (jñāna).

These are the highest of Siva’s energies, his parā sūktic, essentially connected with him, but over which the soul is aloof and alone. From the first two of these parā sūktic, thought and bliss, are successively developed the parā sūktic of desire, action, and wisdom.

All existence, from Absolute Being to earth, is differentiated as possessing essential natures, categories, or properties called tattvas. Of these tattvas there are 36 primary, which produce a cosmos of 60 subordinate tattvas. The 36 primary tattvas contain a pure tattva, which sprang into being by the grace of Siva’s parā sūktic. Of the 5 pure tattvas the 1st is Nādām, the male energy of Deity, developed from pure māyā; the 2nd is Vindu, the female energy of Deity, developed from Nādām; the 3rd, developed from Vindu, is Sādā Siva, or the state of Siva before assuming forms for the enlightenment of souls; the 4th is Īśāvara, developed from Sādā Siva, which is the obscuring element; and the 5th, developed from Īśāvara, is pure knowledge, the pure element which enlightens souls (Hosington, ‘Tattva Kaṭṭālai’, J.A.O.S., 1853). The Sādā Siva tattva is that in which the energy of desire and knowledge are equal, the Īśāvara tattva is that in which action predominates over knowledge, and the pure knowledge tattva is that in which the energy of knowledge predominates over that of action.

It follows from this that Siva may be taken as the efficient cause of creation, the parā sūktic being the instrumental cause, and māyā the material cause.

The process is explained, perhaps more clearly elsewhere, in S.P. (xxii). Here it is stated that the Nādām, or Śiva, or male energy, the first of the Siva tattvas, is developed from kruddhi, or germ, or pure māyā, by the operation of Siva’s parā sūktic, knowledge; and that, by the operation of the parā sūktic of action, Vindu, or separation, or organised material energy, is developed from Nādām; thence Sādā Siva, Īśāvara, and pure knowledge.

These 5 pure tattvas pertain only to the highest order of souls, the Viṣṇuṇa kālāras, who have only the single mala of ātman; for souls associated with the impure form of elemental matter—impure māyā—there is a five-fold investment, or pariśca, kaśchubha, developed, by the grace of Sādā Siva, of 5 impure tattvas: Kālam (time), Niyati (necessity), Kalā (determination), and—developed from Kāla—Vidvāda (limitation), and Rūgam and Jñāna, or touch (desire). In addition to the above five-fold investment, there is developed—by the grace of pure knowledge—first, māya prakṛti, the source of all the subsequent developments: (1) chittam (the will), (2) būddhi (the judgment), (3) ātmarūpam (the individuality or the I-maker), and (4) manas (mind or understanding)—thence—very much with Sāṅkhya—other Indian metaphysics—the 20 primary mental elements, tattvas, or categories, earth, water, fire, and ether; ears, skin, eyes, tongue, nose; tanmātras, or the rudiments, or elements of sound, touch, form, smell; and organs of actions, hands, feet, mouth, excretion, and generation. From these primary tattvas are developed, in the usual manner of Indian philosophy, the subordinate 60 tattvas, or visible physical external organs (Hosington, loc. cit.).

ii. The Soul. The soul is held to be enclosed from eternity in a fine or subtle body, or ātma śārīra. This is an inherent covering which persists with the soul through all its migrations. It passes with the soul to the various heavens or hells, where rewards or penalties for good and evil deeds are experienced, and it also envelops itself in a body or vehicle (ātman—"a word derived from ātman, 'atman,' because it is exceedingly small; and it is so called because, when associated with ignorance or ātman, the sense of the soul is lost in it."

The soul is defined in the S.J.B. (1), as "māyāyā yantra towram anām ātma", or as existing within the body as a māyā-made instrument. All souls are divided into (1) vijñānakalāras, (2) pralayākalāras, and (3) sakalāras. The first, or highest, order of souls—the vijñānakalāras—are freed from māyā and ātman (matter and deeds), and have only one mala, or impurity, of ātman, or nature of the soul. These souls have reached the sphere of the 5 primary tattvas, and the last births and re-births, merely await final union with Siva. The second class of souls—the pralayākalāras—and are under the influence of the three malas of ātman and ātman, which condition them to renewed births and deaths. These souls—sakalāras—which includes all human beings and the ordinary gods or devas, have the three malas of ātman, ātman, and ātman, and are subject to sense perception, having corporeal existences, wherein the ātman has to be balanced. The soul which has corporeal existences is described as proceeding at death from its physical body, or athāta śārīra, to 'undergo its experiences in heaven or hell, and forgetting such experiences as a dreamer forgets his experience when waking,' as a spirit, or ātma śārīra, in the waking state, passes as an atom in Its Śūkṣma śārīra state into a sperm-cell, and is reborn. The ātma śārīra is a third class of the sakalāras, and is the ultimate source of the ātman in the soul, and it persists beyond the other two strata. This ātman is an essentially inherent mala, or delimitation, which darkens the soul’s light or vehicle. Hence its source or cause is the Šūkṣma (S.J.B. ii. 310). This is also said to be a qualified soul of ātman prakṛti, prordial matter, can self-develop the cosmos.
intelligeuce, so that it cannot understand its true nature (S.B. iv.), its oneness with Siva.

The soul or darkness of the soul must receive enlightenment; two-fold deeds must be balanced, and maya sublimated, before the soul gains its final release (mukti, Skr.; matti or vidya. Tamil). This was, by the grace of Siva, sent into sense-perception with a cosmos.

'the maya, "energy" (Skr. maya="conceal"), in them will herself remove this darkness and cause and effect (S.B. c.)

There are ten imperfect forms of emancipation, including that of the gaining of supernatural powers—so commonly professed in India—as the result of acquiring the nature and power of the Divinity. This power over supernatural beings has been described as the teaching of some Saivas who profess that the soul acquires such miraculous powers; that, in fact, the emancipated one is so made a partaker of the Divine nature and attributes that he is able to gain possession of and exercise miraculous powers which are called the "sidddhis." Persons professing to wield such magical powers are not infrequently found in India, and there is in it a generally prevailing mixture of enthusiasm and fraud" (Pope, T.V. p. xiii).

In the recognized form of emancipation, or union with the Deity, an essential feature of the Saiva religion is that there is no annihilation of the soul, but its individuality or egoism is lost—"its karma has been extinguished. Its identity is lost but not itself" (Nallaswami, S.B. p. 69).

The soul has, as the result of release, this conscious immortality in a separate existence; for, although sharing the blessedness and wisdom of the supreme, it is not mingled with His essence" (Pope, T.V. p. ix).

S.F. (lxiii) says that the soul, when freed, 'is closely united with the higher knowledge, the pâramây. by which it is illuminated, and in whom it has a firm footing—and the soul becomes immutably united with Him. The pâramây, therefore, in the grace of Siva and Siva there is neither duality nor non-duality. The union is to be held similar to that seen when the words tail, 'foot,' (soul), and tail, (Siva), are joined; according to the rules of Tamil phonetics, the combined word becomes tail, the foot becoming united into foot; 'so consider the union of soul and Siva' (vil. 77).

Before the soul passes to its eternal rest in Siva, it is a jiva musthâya, 'freed from life,' but living 'in the body still for a little while, but in a restful state, and power, and faculty, with the Infinite Eternal. He has put off his rich garments and adornments, is besmeared with white ashes, and wears the peculiar habiliments of the ascetic. From his head depends the braided lock of the Saiva ascetic; one hand grasps the staff, and the other the mendicant's bowl; he has for ever renounced the world—all the worlds—sava Siva's self—"Pope from Varadaraj Purâna (T.V. p. xili)."

DREAMS AND SLEEP.

Introductory (A. LANG and A. E. TAYLOR), p. 29.

American.—See DIVINATION (American).

Egyptian (G. FOUCHART), p. 34.

DREAMS AND SLEEP.—I. General.—From the point of view of psycho-physiology, dreaming is only a part of the more general phenomenon of sleep, and cannot be fully treated except in connection with the wider topic. The physiology of sleep and dreams is still very little understood, as

will be seen by comparing the earliest scientific treatment of the subject, that of Aristotle, with the latest hypotheses of modern physiological psychology.

According to Aristotle (de Somno, de Somnis, and de Divinatione per somnam), sleep is a
DREAMS AND SLEEP (Introductory)

periodical phenomenon found in all animals, and in animals only. It is thus an affection of that phase of mental life which is common and peculiar to animals, the faculty of presentation (ρεφανεστία). Its raison d'être is the need for perpetual to the waking state of central condition from the fatigue attendant on long-continued exercise. Since this state of fatigue attacks the whole representative machinery simultaneously, the condition is naturally associated with the state of waking, and must be sought principally, not in any of the special sense-organs, but in the ινέων αἴσθησις, or central seat of presentation, the heart. More precisely the recurrence of sleep is due to changes in the blood consequent on the taking of food. Food, when taken into the blood, evolves heat and evaporation; the evaporation is suddenly cooled on reaching the brain, and a movement of antiperistalsis is set up, in which most of the vaporized matter is expelled again downwards. It is to this that the muscular relaxation and sensory inactivity of sleep are due. Aristotle thus anticipates both the views that the immediate cause of sleep is a central condition of the 'highest centres,' and that the change is due to the temporary presence of toxic substances in the blood. Dreams are affections of the central organ of consciousness (ινέων αἴσθησις), which must therefore be looked upon as disturbances of the actual sensory percepts. In perception the affection is originated by a real physical stimulus; in sleep such actual perceptions occur sporadically, but they are not the main stuff which dreams are made of. The direct cause of the dream is the persistence in the 'common' or central sensorium of faint relics of the motions formerly aroused by actual stimuli. These residual motions are equally present in waking life, but are not accounted for because they are obscured by the more violent motions due to actual present stimulus. In sleep, where actual stimulation is excluded, the more minute affections of the system due to these minimal disturbances become apparent. Hence we are enabled to give a rationalistic explanation of genuine prophetic or 'veridical' dreams, when they are not due, as most of them are, to mere coincidence. Veridical dreams of impending illness, or recovery, or death are 'indications' of the coming event, due to the dreamer's sensibility to minute organic disturbances which are imperceptible to waking life. In other cases a dream may actually be the cause of its own fulfilment, by providing the first suggestion of an action which is afterwards dwelt on and carried out in the waking state. Veridical dreams in this condition of our intimate friends are accounted for on the ground of our special preoccupation with their concerns, which renders the sleeping soul exceptionally sensitive to those minimal disturbances in its surroundings which originate in the friend's organism. It is never permissible to ascribe such dreams to the direct agency of God; if they came from God, they should be specially vouchsafed to the dreamer (which is not the case), and their occurrence should exhibit marks of intelligent design instead of being, as it is, sporadic and casual.

The best modern accounts of the subject as a part of general psychology are perhaps those of Vollmann von Vollmar (especially good on the descriptive side) and Wundt (see Lit. below). The following summary is taken from Wundt.

Physical or nervous and other periodical functions of the organism, must be looked for in the central nervous system. It is probably a condition due to the temporary exhaustion of the available central forces, and has for its purpose the accumulation of fresh 'tensional forces,' which is favoured by muscular inactivity and diminished production of heat. A second condition is the complete or partial abolition of attention. (Animals regularly fall asleep if deprived of their usual sensory stimuli, and so do men of low mental capacity.) It is probable that this nervous or central condition is a specific alternation of condition favourable to sleep, its direct exciting cause being a specific alternation of condition in the central nervous system which is normally accompanied with a diminution of attention and of the effects of narcotic stimulation, and is most likely that narcotics produce their effect by inducing this central change. Hence Parkinzie and others have held that the direct cause of sleep is to be found in the partial use up of the oxygen of the nervous system effected by the accumulation of carbonic acid, the final product of respiration. In what region of the brain the assumed 'sleep-centre' lies is not known. The physiological changes induced are in general the nature of inhibitions, e.g. diminution of the activity of heart and respiratory apparatus, probably due to contraction of the smallest cerebral blood-vessels. This period of suspended activity begins about three-quarters of an hour after its commencement, and to last about half an hour. Then follows a period of lighter slumber of several hours' duration, which forms a preparation for waking. This period of actual sensorial and percepts.

Dreams, as a rule, one of complete, or all but complete, unconsciousness. Dreaming, on this view, is an accompaniment of the gradual transition from sleep to waking. Similarly, Volkmann divides the processes into five stages: (1) drowsiness; (2) falling asleep; (3) complete sleep; (4) lighter sleep, attended by dreams; (5) waking. The dream has two chief characteristics: (a) the memory images of which it is composed are hallucinatory, i.e., they are mistaken for real and present physical things; (b) the process of apprehension is altered, so that the actual percepts which enter into the dream are interpreted in an illusory fashion.

Dream-appearances, which Volkmann classes as hallucinations, are more accurately regarded by Wundt as generally, if not always, based on illusion; i.e., they are misinterpretations of actual minimal sense-impressions, such as those due to slight noises, to the position of the sleeper's limbs, to truffling pains, slight difficulties in breathing, palpitations, and the like. A slight intercostal pain is misinterpreted as a dagger, a movement of the foot for a fall from a tower, the rhythm of our own breathing for the rhythmical motions of flying, etc. The visual dream is less ambiguous about the condition of internal retinal stimulations, which appear to the dreamer as flights of birds, butterflies, fishes, etc. (The present writer does not believe that he ever has dreams of this kind, which Wundt regards as remarkably common.) Dreams of water are explained by Wundt as due to Urindring in the sleeper's body. Hence again the exceptional frequency of dreams of fishes. (The present writer, with general artistry in painting dreams of fishes at all, nor do several persons of whom he has made inquiries.) The common dream in which we hunt for an object that can never be found, or start on a journey and have repeatedly to return for something that has been forgotten, is explained as due to disturbances of the Gesamteffah, the general mass of organic sensations. The successive illusions of the dream can into a continuous story by association with memory-images. Wundt attaches special importance to memories from the immediate past, particularly those connected with deep emotional excitement. The dream of the recently dead by the emotion with which we watched their last moments and attended their
burial. (This explanation is clearly insufficient. We dream regularly of those for whom we have cared the most, though their death may not have been recent, and may have taken place at the other end of the world. Wundt also omits to take account of the connexion between events from our early childhood, even when they are of a trivial kind and not likely ever to have been attended with any special degree of emotional excitement.)

In general this account would seem to lay too much stress on the element of illusion and too little on that of hallucination. It is probably true that actual minimal sensations form points de repere in all our dreams, but there is no reason to confine the element of genuine hallucination to the one function of establishing links of connexion. Nor is association by itself a sufficient principle to explain the way in which the dreamer interprets his minimal percepts. The individual’s habits of diet, no doubt, largely determine the type of his dreams. A man who eats a heavy meal just before going to bed will dream very differently from one whose meals are light and who eats and drinks nothing for several hours before going to sleep. But, in the main, the cue for our interpretation of our dream-sensations is given us by our interest in the dream itself about the things and persons wherein we are interested. Hence dreams often exhibit a more rigidly logical sequence of events than the facts of waking life. Since the ordinary avenues of intercourse with the extra-subjective world are all but cut off in sleep, the dream can follow its course without interruption, whereas in waking life we have constantly to suspend the working-out of a course of thought or action to attend to wholly irrelevant issues. In much the same way we may explain two of the most familiar peculiarities of dreams— their extraordinary vividness, and the curious foreshorting of time which seems to occur in them. The vividness seems to be due to the absence of the mass of complex and uninteresting detail in which the really interesting experiences of waking life are framed. The interesting presentation stands out alone, or almost alone, and thus engrosses the whole available attention of the sleeper; if we see a sunlit meadow, we see also the shadows that sweep across it, but in dreams there is no light without the shadow. So with the apparent shortening of time. The dream is wholly made up of the interesting moments, without the uninteresting detail which would form their setting in real life. We may dream, for instance, of eating dinner, but not dream each bite separately, though we should have to perform each separately in real life. Or we dream of an important interview, without dreaming of all the uninteresting and irrelevant ‘padding’ which would really spin it out. Hence the apparent contraction of events which would really fill hours or days into a dream which occupies a small time.

The question whether sleep is always accompanied by dreams or not is one which there seems no means of answering. The general opinion of psychologists appears to be that the deepest sleep is entirely unconscious, and that all our dreams belong to the phase of gradual return to the waking state. This is not, however, proved by the fact that we seem only to remember dreams which are typically vivid or are in some common experience to wake, like Nebuchadnezzar (Dn 2), with the firm conviction that we have had a striking dream which we are totally unable to recall. In many cases, it often seems that the last dream is suddenly remembered towards the evening. The cognate facts of hypnotism also show the fallacy of arguing that an interval from which we can recall nothing must have been one in which we were aware of nothing. Whether ‘the mind thinks always,’ as Descartes and Leibniz maintain and Locke denies, must, for want of evidence, be left an open question.

One of the most curious features of the dream is the modification of the central personality of the dreamer which not infrequently occurs. We dream that we are committing, with a light heart, misdemeanours or even crimes which would be impossible to us in waking life. Or a man may dream that he is a woman (or vice versa), and the assumed rôle may be kept up throughout the dream with remarkable dramatic verisimilitude. Or one may assume, for the purposes of the dream, the personality of some familiar historical character, such as Mary Stuart or Oliver Cromwell. Or, again, if the present writer can trust his analysis of his own dreams, the sense of individual personality may be temporarily completely submerged; the dreamer may drop out of the list of dramatic personages on which he is accustomed to look for his part in the world of affairs. This change of identity may be so thorough that it may seem to the dreamer that he is actually a person of another sex, or of another age, or of a different race.

2. In Greek literature.—The belief in the Divine and prophetic character of dreams is universal throughout Greek literature. In the classical language the exposition of dreams is regularly subsumed under μνειακα, as one special province of the art of the μνας, or seer. Aeschylus, writing early in the 5th cent., when the rise of ‘Sophistic’ was giving a special impetus to the glorification of a dreamy culture hereafter, may be thinking of a special origin in oneiroscopy among the chief things for which mankind are indebted to Promethus (Prom. Vinct. 485: κώστα μνειακα ες νευμα κα τραπ γενεσθαι, et.). In Homer the sender of dreams is Zeus; it is he, too, in the Odyssey, who of all Achaeans awakens the Acasta to an unlooked-for part in the story of Troy. (For of course Zeus is not named in this passage, but the Acasta’s dream is a general one, which is afterwards distinguished as the part played by Ajax in the second siege of Troy.) In the case of Agamemnon’s false dream, Nestor says: ‘Had any other of the Achaeans told us this dream, we might deem it a false thing and rather turn away therefore; but now he hath seen it in dreams awesomely himself, the greatest (Il. ii. 50–53). As the over-lord, in Homer, is lord by the will of Zeus, he is apparently supposed (without much positiveness) to receive from Zeus counsel in dreams, while other men’s dreams are of no account, unless, indeed, some accepted νευματος, or dealer in dreams, accredits them. The word occurs but once in Homer (Il. i. 63: ‘some soothsayer or interpreter of dreams speaks to me from Zeus’). In parts of Australia the natives believe that a supernatural being, ‘Kutchi of the Dieri, Bunjil of the Wurunjeri, or Daramnlun of the Coast Murring,’ may visit the medicine-man in dream or vision and reveal to him matters of importance (Howitt, Native Tribes of S.E. Aus-
The familiar Orphic doctrines, that the body is the 'grave' of the soul, and that it is only when free from the body that the soul awakes to its true life, led naturally to the view that in sleep the soul converses with eternal influences and communications from Heaven to which it is not accessible by day. This doctrine is specially prominent in Findar and Aeschylos—poets who stood in specially close connexion with Sicily, one of the chief homes of Orphicism.

Thus Findar says in a well-known passage from the Ορθρός (fr. 131, ed. Schröder) that the soul 'slumbers while the body is active; but, when the body slumbers, she shows forth in many a vision the approaching issues of woe and weal' (ἐν τολάοις ἀνθρώπου ἐκδεικνύεται, ἢ ἦμι σε ἐμείς ἀνθρώποι βροτοί). So in the speech of Drotina in Plato's Symposium (which is demonstrably Orphic in its original form) it is held that we require a fiery oracle to consults on to his revenge by threats conveyed perhaps in horrible dreams, and prepares the way for the enterprise by sending the dream. Clytemnestra misinterprets and dignifies her dream. The theory of incubation (i.e. by dreaming on a spot of special and proved prophetic virtue) is, in historical times, peculiarly under the patronage of Asclepius, and his great temple at Epidaurus is the most famous of the sanctuaries at which such dream predictions could be received. It was usual for the god in person to 'appear in a dream' to the patient and dictate the remedy, or even leave it behind him. When we remember that there was a widely circulated popular scientific literature of medical works addressed to the laity and containing directions for diet and exercise, and prescriptions for common disorders, we can readily understand the considerable repute obtained by sanatoria of this kind. Apart from these great sanctuaries, there were also private professional exponents of the science of interpreting dreams (ἄρτοκρατοι), who were regularly at the service of the credulous. Thus Theophrastus (Charact. xvi. 11) notes it as characteristic of the ἄρτοκρατοι, or δεινός, that, 'when he sees a dream, he utters it freely, and the augur, the doctor, or the augur who reads the dream, interpreter,' to ask to what god, male or female, he should offer prayer.' There were also, as with ourselves, handbooks of the science, for private use, to hand. Thus the time, belonging to or about the 2nd cent. A.D., has come down to us. Even apart from the performance of special ritual purifications (ἀνάδοσιςκρήσεις) to avert the fulfilment of evil dreams, it was held an effectual method of banishing them, as of baulking the effect of evil forebodings generally, to come out into the open air and 'tell them to the sky,' as Iphigenia does with her sinister dream in Euripides (Iphig. in Tauris, 2: οἱ ἄνθρωποι ἰδοὺ· ἐπίσωρα ταῖς ἀρχές τῆς ζωῆς). The same remedy could be practised against presages of evil of any kind, as is done, e.g., by the nurse of Medea in the prologue to that play (Eurip. Med. 67 f.: ὡς ἡμάς μὴ ἔπιλεγε ῥήτορες τὸν συναντήτορός μοί ἐπιθύμητον). The complete ritual involved purification of the bedroom and the dreamer with torches and hot water (cf. the barlosque performance in Aristophanes, Peace 1338: ἀλλά μοι ἀντικήνοις λέγειν ὄμηρον· ἐπευγαίρεται παγγαίνων ὄμηρον, θερμοί μεν ὀπίσω, ὣς ἐν διαφόρον ἀντικήνοις περιπατεῖ). The belief in the Divine and prophetic nature of dreams plays an important part in the Orphic religion and its descendant, the Pythagorean philo-

DREAMS AND SLEEP (Introductory)
DREAMS AND SLEEP (Introductory)

the actual Socrates but not shared by Plato. Even the account of the dream of the youth may possibly represent an experience among the Pythagoreans of the late 6th cent., to which Plato would not have wholly subscribed. It should be noted that the famous dreams ascribed to Socrates in the Cratylus and the Lachesis are clearly of Orphic-Pythagorean provenance. The vision which warned Socrates that the treacherous left his soul would reach Athens on the morrow is manifestly the 'fetch' of the Lachesis, which is just leaving the island and about to join Apollo of Delos, the great god of Pythagoreanism. The other vision, which had Socrates 'practise music,' clearly comes from the same source, as he obeyed it by composing a pean to the Delian Apollo (Diog. Laert. ii. 42).

From the Academy the doctrine of Pythagoreanism about prophetic dreams would appear to have passed to the Stoics; hence we find Zeno advising his followers to keep their dreams as a test of their advance towards virtue (Plutarch, De Profect. in Virt. 12; von Arnim, Fragmenta Stoicorum, Leipzig, 1903, i. 50; ἡ τελεπαθία τοῦ ἱδρύτου ἱεροῦ τούτου ὄντες πνευμάτων πρὸ κατοικήσεως.)

A. E. TAYLOR.

3. Savage and modern dreams.—These Greek beliefs or theories, like most of our theories on such matters, are only more articulate statements of the common conceptions of savage peoples. The Narraga think that the human spirit can leave the body in sleep, and communicate with the spirits of others (telepathy) or of the dead (Howitt, 434). The sleep of the body is the holiday of the soul, which, in sleep, as after death, can ascend to the spiritual plane above the sky, and is free from the bonds of time and space.

Among ourselves, people tell us that they have seen their relatives in dreams and have later come to and recognized them in scenes which they had never before visited in the body. In the same way Howitt writes (p. 439):

'An Aboorjwary man told me that his father came to him in a dream, and said that he must look out for himself, else he would be killed. This saved him, because he afterwards came to the place which he had seen in the dream, and turned back to where his friends lived, so that his enemies, who might have been waiting for him, did not catch him' (p. 439). One of the Kurnit tribe, being asked 'whether he really thought that his Yemite (spirit) could go telepathically,' simply answered, 'yes, I sleep, and I get to distant places, I see distant people, I even see and speak with those who are dead.'

The spirit of a man may visit his friends in his dreams, and experiences are common to most races in the lower culture (see E. B. Tylor, Prim. Cult., 1903, vol. i. pp. 397-400). The belief in the interpretation is, of course, reinforced by what Tylor calls 'doubt narratives,' namely those in which the theory of the experience is mutual. A dreams of B, B (awake or asleep) sees A in the circumstances of the dream.

Tylor quotes St. Augustine (De Civ. Dixi, xviii. 19) in a story told to the saint by a friend. This gentleman, before going to sleep, saw a philosopher of his acquaintance, who came to him and expounded certain Platonic passages which he had previously declined to understand. 'I did not do it,' said the philosopher, when questioned, 'but I dreamt it.' In another case a student in Africa was 'coached' in some Latin difficulties by Augustine, who was in Italy. But Augustine did not dream, or did not remember dreaming, anything about the matter (De Curt. pro Mortuus, xii.; Ep. civii.).

There are many modern tales of this 'man and event' experience which may be mentioned which were written out and signed by the dreamer and his mother, who was in the house at the time of the event:

The Rev. Mr. J. fell asleep in his club, in Princes Street, Edinburgh. He dreamed that he was late for dinner, and that he went home to the house of his father, Sir John L., in Aberdeen Place, where his father would not let him open the door with his latch-key, but it was opened by his father. He then ran upstairs, and, looking into his father's bedchamber, saw a man lying, dead, and found the father below game after him. He then awoke, found that he was in his club, and that the hour was ten minutes to midnight. He hurried home, and found the father lying on the floor, in a state of deep sleep, where he had lain without moving for some hours. (The Philosophical Magazine, iv. 50.)

'There have been some authorities who have given us the usual answers for the ascription of dreams,' answered the philosopher of St. Augustine's tale, Mr. R. answered, 'I did not do it, but I dreamt I did.' Sir John L. was dead when the written narrative signed by Mr. R. was communicated to the writer. Other cases, equally well attested (by five witnesses on one occasion, and by the dreamer) might be given, but enough has been said to illustrate this unusual type of experience.

It is clear that primitive thinkers could explain a dream experience only by the belief in an indwelling soul of each man: and, when the dream proved to be 'clairvoyant' (as of a place not previously seen, but later found), or 'mutual,' the theory would be corroborated. Persons with such experiences, however, were inevitably alive at the conception of spirits, both incarnate and discarnate, and manifestly this belief has been one of the most potent influences in the evolution of religion. As Tylor says (op. cit. p. 445), speculation passed 'from the human soul to the disembodied soul really comes into the presence of the sleeper' (or of persons wide-awake) 'toward the later opinion that such aphantasm is produced in the dreamer's mind' (or of a wide-awake observer) 'without the perception of any external objective figure.'

There are, practically, the two hypotheses: those of an 'astral body,' a real space-casting entity (1), and of 'telepathy' (2). But rationalist, if not reasonable, thinkers will dismiss both hypotheses as figments made to account for events which never occurred. These varieties of opinion, however, do not concern us. We merely record that dreams (with other psychological experiences) account for the animist or spiritual element in religion.

A man's dream comes true; he finds that what he saw in a dream was, though the man no normal means of knowing it, true in reality; he therefore infers: 'something within me can go out of me and wander into places where I have never been.' A modern instance, narrated to the writer by the dreamer, may be given:

At a ball in Stirling, some fifteen years ago, several persons were poisoned by eating ill-conditioned oysters, and some died. The husband of the narrator was among the sufferers. On becoming aware of his condition, he wrote and fastened up two letters to two different firms of stockbrokers in Glasgow, which his wife posted. On the night of his funeral she dreamed, and told the dream to a sister-in-law who slept with her, that she went to two different offices in Glasgow, and in each saw an open ledger, and on a page in each her husband's name at the head of a long list of curious names, of which she mentioned a few. They were the denominations of mines in the Transvaal. At the foot of each page figures were written showing the state of the accounts of the miners. In the one the amount was smaller; in the other larger; the amount was something over £2000. The lady had no idea that her husband was speculating till she saw the addresses of his letters to the stockbrokers, and, on seeing these, before his death she wrote to them, asking them to wind up affairs. To abridge the story, the stockbrokers, after examining the accounts, distinctly proved exactly correct.

The interpretation was by a professor of psychology in a Scottish University, who is the speculator that the husband often told his wife all about his dealings in gold mines, but that she had never listened, and the information was still in a dream, which she was convinced was possible to the dreamer.

When a dream discloses future events, it produces a great impression on many minds, and in unscientific ages is explained as Divine revelation. The Homer of the Homeric tradition, that true dreams come through the gate of horn, false dreams through the ivory gate, is based merely on a pun in the Greek. We now account for prophetic dreams in the mass by saying that, out of dreams of mere fortuitous coincidence is applied; while every one knows that, in telling a dream, we almost inevitably give rational shaping to what was not rational, and, generally, decorate the anecdote. The number of dreams about winners of any great horse race is so great that some must
DREAMS AND SLEEP (Babylonian).

The dream played an important part in the life and religion of the Babylonians. In the dream the deity was deemed to reveal his will in a special way to the individual, declaring the will of heaven and predicting the future. The bard, or 'seers,' constituted a particular class of priests, and one of the titles of the Sun-god was baru terit, 'the seer of the revealed law.' Prophetic dreams, however, might be sent to the ordinary layman as well as to the professional 'seer,' and there were books for interpreting their meaning. It would seem that answers to prayer could be obtained through sleeping in a temple and invoking Makhir, the goddess (or god) of dreams. At all events, in a penitential psalm (WA.I, iv. 60, 2) we read: 'Revel thyself to me and let me behold a favourable dream.'

Another type was the dream to be useful, which was considered by Babylonians as a gift of the Sun-god, a means of obtaining knowledge of the future. The interpretation of dreams was taught by Babylonian priests and was connected with astral-astrological, mythological, and magical ideas, and was considered to have a religious and educational value.

In the Epic of Gilgamesh dreams play a conspicuous part. In the struggle of the Babylonian hero with Khnhababa three dreams are needed to assure him of success. The loss of his friend Enkidu foretold a vision of fire and lightning, and in the story of the Deluge the impending destruction of mankind was said to have been revealed to Utu-napišti in a dream. The historical inscriptions are equally full of references to dreams. The will of heaven was made known to Gudea of Lagas through a dream, and the army of Assur-bani-pal was encouraged to cross a river by the appearance in a vision of the goddess Istar, who declared: 'I march before Assur-bani-pal the king, who is the creation of my hands.' Assur-bani-pal himself, when overwhelmed with despair at the outbreak of the war with Elam, was similarly reassured with a dream that one night he dreamed that he was in Pisciaulia. The street was covered with blood, and Istar was driven through the past. Looking round, she saw the late Duke of Edinburgh, with whom she was acquainted. He said, 'They are taking the news to Clarence House.' The following day she read in the newspaper the news of the murder of the Duke's father-in-law, Alexander n. of Russia.

This aspect of dreams (if the facts are accepted) may, of course, be viewed from the side of Myers' theory of 'the subliminal self,' as stated in his book, Human Personality (1905). By those who accept, more or less, Myers' hypothesis some dreams are taken to be 'supernormal,' and bear witness to unexplained ranges of human faculty. In other cases they merely show that incidents which have had no trace on the ordinary memory are none the less treasured in the subconscious memory, and may be communicated to the upper consciousness through the mechanism of remembered dreams. If no man dreamed, it is probable that our modern philosophy never would have evolved the conception of spirit; while, if only five per cent of mankind dreamed, it is fairly certain that the other ninety-five per cent would remain an entirely mending.

DREAMS AND SLEEP (Egyptian)

1. Introduction. — Although dreams were not considered of much importance in Egypt as in Chaldea, Phoenicia, or the Hellenic world, the role allocated to them was much larger than is generally thought; they occupied a constant place in Egyptian life. The relative scarcity of information is a result of the nature of the monuments at present published. While the epigraphy of the temples furnishes only a very few official examples of dreams, we find (1) that, in spite of this scarcity, dreams are of constant occurrence in the literary papyri; and (2) that the instances of Egyptian dreams mentioned by late authors are proved by a correct excerpt from an Egyptian origin. These two points give us ground for thinking that the deciphering of the still unpublished papyri and ostraca will yield an unknown wealth of information.

Further, the study of unpublished ex votos stelae ought, to all appearance, to furnish large additional material on cases of miraculous healing obtained by the medium of dreams. If to all this we add the passages in our sources in which dreams are not expressly mentioned, but are implied by the fact that formule are employed similar to those used in cases of dreams related expressly as such, we are forced to the conclusion that the current ideas as to the frequency and importance of dreams in Egypt stand in need of considerable modification.

2. Classification of material. — Dreams in which the gods intervene directly may be divided into three groups: (a) unsolicited dreams in which they appear in order to demand some act of piety towards themselves; (b) dreams in which they give warnings of various kinds spontaneously; and (c) dreams in which they grant their worshipers an answer to a question definitely stated. The cases of unofficial magic forcing dreams into its service form a separate class.

This classification has the advantage of arranging the facts in a fixed number of groups, which bring into greater prominence the essentially Egyptian characteristics, and also help to decide whether a certain number of dreams mentioned in the Greek and Roman inscriptions can be regarded as really Egyptian. This is an important question to settle for the general theory of dreams.

3. Unsolicited dreams. — Of this first class the work entitled De inscriptionibus Thothis IV. is the best specimen contained in our sources. Falling asleep during the chase, at the foot of the statue of the Great Sphinx, the young prince heard the voice of a god. It promised him the throne of Egypt, and required him to repair the god’s temple, which was threatened with ruin. This story leaves no doubt that the accounts of Neotanemus, though handed down to us in Greek form (cf. Le Sens du DREAMS et de la Pleureuse, by J. Fontenoy, and a number of Greek Inscriptions, by J. Loynad, 1838, p. 122), is an adaptation of an Egyptian document. As in the case of Thothis IV., the god (under the form Anhuri) appeared to the king, and commanded him to repair a certain temple. This is a case of certain works at his temple. On waking, the king was greatly perturbed, and gave the necessary orders to have the work completed with all expedition. It is quite certain that this inspired legend sprang from the remains of a stele, like that of the Sphinx of Gizeh, on which the priests had had an account engraved of the marvellous incident that caused the repairing of the temple.

The case reported by Thubrac (de J. et Oeur, 28) of the dream of Ptolemy Soter belongs to the same category. The king dreams of a colossal statue which orders him to take it back to Alexandria, where it was formerly situated. He interprets this dream as a sign of power and freedom. It shows him that the Sphinx of Gizeh, on which the priests had an account engraved of the marvellous incident that caused the repairing of the temple.

The question of the absolute authenticity of these documents cannot be discussed here. It was proved long ago that the majority of the stelae devoted to dreams on which the dreams were made after Divine intervention bear inscriptions of a much later date than is attributed to them (e.g., the Stele of Cheops at Gizeh, the Stele of the ‘Family’ of Bakhtan, etc.; the Stele of the Sphinx, in particular, has been shown by Erman to be a new version of an analogous legend attributing an identical dream to another prince). It still remains to be proved, however, that these ‘forged’ documents are not adaptations of ancient inscriptions or transcriptions on stone of ancient papyri. The only important facts to be kept in view here are: (1) that official dreams admitted as a regular process this method of Divine warnings by dreams; (2) that numerous restorations of temples and cults were really the outcome of dreams actually experienced, as well as the object of divine foresight, as the will of the gods. An examination of the official texts relating to these restorations of monuments is needed, as well as a study of the parallelism of formule, that these cases are much more numerous in Egypt than is usually supposed.

Besides the above, in which the gods may be said to have been working primarily in their own interests, unsolicited dreams were granted also for the benefit of humanity. The revelation by a dream of the hiding-place of some wonderful chapter, or for use in funerary or medical magic, seems to have been the traditional origin of a number of formal or groups of formule inserted later in the great compilations which became the ‘Books of the Dead’ and the first medical papyri. All that the gods of Egypt did in such circumstances was to show the continuity of their legendary role of ‘beneficent masters of this whole earth.’ Their intervention sometimes took an even more direct form, warming the being given by the god to the chosen kings, who were the Divine heirs, or to important personages, princes, or even simple mortals loved by the gods. Sometimes they revealed the action to be taken in the hour of need, and also help to decide whether a certain number of dreams mentioned in the Greek and Roman inscriptions can be regarded as really Egyptian. This is an important question to settle for the general theory of dreams.

The famous Ethiopian Stele ‘of the Dream’ is the typical example of this class. We are told how Tountamon ‘sees in a dream in the night two serpents, one on the left, one on the
right," and how it was explained on his awaking that these two kingdoms were represented on the horizon by the two Egypt (North and South) of which he would soon be master.

In other cases the gods do not scorn to foretell happy events to certain persons in whom or whose descendants they are particularly interested—with a view to the good that will result for the whole of Egypt. The story of Satni, father of the great magician Sesostris, is an example.

"Now Satni went to sleep and dreamed a dream. Some one spoke to him, saying: 'Thy wife hath conceived, and the child she shall bear through thee shall be called Sesostris, and he shall be a denizen of Egypt."

Sometimes, again, a dream directly reveals the wish of a god. Thus the prince of Baktian saw in his sleep a draught of the sacred river, and said to his father, who was a wise man, 'Is this a sign that he had to send back to Thebes the miraculous statue of the god Khonsus, which had formerly exercised a demon from his daughter. Sometimes, also, the Divine spirit warns the king in a dream to avoid certain projects, either immediate or far afield, which would turn out harmful to the kingdom. However adapted they may be in non-Egyptian compositions, the dream of Memnound, the heir apparent, in which his dream-interpretation by Joseph ( Gn 41) are two good examples, the constituent elements of which are similar to those of Egyptian accounts of such Divine warnings.

The Egyptian dream lore has some descent from the stories of a Copto-romance—the fabulous life of Alexander: 'Then Memnound had the following dream, and saw this vision: he saw a lion loaded with chains and cast into a pit. A man spoke to him: 'Memnound, why dost thou not descend with this lion, since it is perverted to thee? Get thee up, and seize him by the neck of his purple.' Memnound's grief at this dream, and his convictions that the lion signified his master, were not mistaken—in the morning a messenger announced the death of Alexander at treacherous hands." It is highly probable that, if the legend is a genuine one, it is a form from the ordinary type of historical dreams attributed to the Pharaohs of national legend.

The same remark applies to the Scripture story of the dream of Pharaoh and the part played by Joseph. In the present state of our knowledge, there is no reason to suppose that this episode belongs to any particular reign in the Egyptian dynasties, nor even that it belongs, for a fact, to some analogous fragment of the national folklore relating to the legend of the Pharaoh of the romantic cycle. But Egyptianity is in a position to state with assurance that none of the elements of the story is a priori in conflict with the Egyptian data relating to dreams. We know from history that the subject itself (the periods of drought and fertility resulting from the annual overflowing of the Nile) was one of the chief interests of the Egyptian monarchy; the famous stela of the island of Denderah (the "Coffin Texts", e.g., in evidence that facts of this kind were of great importance in nonmonarchical religious ceremonies. We have, moreover, both witnesses to the vital importance of this matter—the former by warnings, the latter by acts of piety. The symbolic method of warning, in the form of dreams, and of giving the least hint or least sign, is analogous to that of the serpents in the Egyptian 'Dream Stela.' Finally, the Pharaoh who wishes to interpret the dream, after all the magicians and wise men had been consulted in vain (Gn 41), is likewise in agreement with Egyptian usage: the popular tales relate that, on the failure of the regular interpreters, the king applied at will to private persons noted for their wisdom, as, e.g., in the case of the wise old man consulted by the Pharaoh in the 'Story of Cheops and the Magicians.'

The interpretation of symbolic dreams was the business of special persons—the 'Masters of the Secret Things,' or the 'Scribes of the Double House of Life' (a very poor modern translation; the real meaning of the title is rather 'the Learned Men of the Magic Library'). At no time do these 'official dreamers' seem to have had the prominence that they enjoyed in later civilisations. As regards the romantic codification of the significations, things, and phenomena seen in dreams, it is hardly likely that Egypt did not possess lists of this kind in the temple, as a matter of fact, we do not possess at the present moment a single papyrus of the same kind as the collections of 'omens tablets' of the Chaldean civilization. It is not a question, of course, of the dreamer seeking for a theoretical system or anything approaching the Oneirocritics of Arcemidus or al-Ghazzal, etc., who could expect would be lists of facts and interpretations conceived on the model, e.g., of the horoscopic calendars.

4. Solicited dreams.—Of more frequent occurrence is Divine intervention by means of dreams sought and obtained, either in exceptional circumstances or in regularly arranged form. Good examples of the first class are furnished by the historical cases of kings finding themselves in a difficult situation, and imploing a god to grant them some help on the future in the dreams that they should follow. The classical inscription of Memenptah (Great temple of Karnak) is a good example:

"Then his majesty saw in a dream as if a statue of Ptah were standing before Pharaoh. He was like the height of... He spake to him, 'Take thou (it), while he extended him the sword, and hasten thou the careful heart from thee.' Pharaoh spake to him, 'Lo... '" (Breasted, Ancient Records of Egypt, Chicago, 1906, p. 54).

This passage throws light upon Herodotus' story (ii. 141) of the dream of Sothos, a priest of Hephastus, during his struggle against Sennacherib:

"...he put to the priests of the god, and informed them of his dream in a prayer, the model of which is given in Maspero, Contes pop. (see Lit.); and the appearance of the god in a dream was not an unexpected phenomenon, but a necessary consequence of the worship.

The rest of the story—the entering of the temple, speaking before the statue, excommunication, and, lastly, the response of the god—are pure Egyptian characteristics, and are in complete agreement with what we learn from this point from the inscriptions and popular tales.

The various sources of information that have come down to us prove that incubation in the temple in order to obtain a remedy or a magical response was a current practice, not only among princes, but also among private individuals. It is wonderful to find, once more, and in this connexion, how accurately informed is the usually believed. Before Egyptianological knowledge had supplied the necessary proof, the accuracy of Diodorus (i. 28) was contested (Wilkinson, Manners and Customs, Lond. 1878, ii. 256):—"...the figure of the god, in the temple of Memphite Sethos, was worshipped in a public fountain, and the priest, who was called the 'dream-maker,' would take water from it and write the words that were to be spoken to him at the following morning, in the ordinary course of his dreams."

The story of Satni tells of Maltiukanibbi going to the temple of Isattussi (Asklepios) in Memphis, praying to the god, then falling asleep in the temple, and receiving from the god in a dream a cure for her sterility: 'When to-morrow morning breaks, go thou to the fountain of Satni, thy husband; there thou shalt find growing a plant of colocasia; pull it up, leave and all, and with it make a potion which thou shalt give to thy husband; then shalt thou sleep with him, and that very night shalt thou conceive.'

This story is not simply a literary fabrication; for we have the famous Memphis Stela of Pasaenepth, of the Augustan period, giving epigraphical evidence of another case of sterility being similarly treated by a remedy revealed in a dream by the same god Isattussi.

By piecing the various texts together, we gradually arrive at a re-construction of the 'processus' of the Egyptian dream by incubation in the temple. The patient entered one of the sanctuaries where the gods were reported to give responses to those who came to sleep within the sacred enclosure.

Our information is finally verified by the texts discovered in the temple of Isattussi in Memphis, and of Thoth in Khnum. All indications of a specifically magic nature lead to the suggestion that the temple of Thoth Teo at Medinet-Habu, near Thebes (see Durham and Mercure [Egypt] and for the celebrated sanctuary of Isis at Philae, cf. a.p. 45. In Philae, we are assured by Petrie that there were special places in the temple of Bastet, in Siut, in the temple of dreams from the goddess Hathor (Itharlo) relating to the locality of turquoises mines (cf. Egypt and Israel, London, 1911,
p. 49, and Personal Religion, do. 1900, pp. 27, 81). But the same author is probably wrong in thinking that this practice represents a borrowing from ancient Semitic religion.

When the night had returned, the worshipper prayed the deity to reveal himself: 'Turn thy face towards me'; and besought him by his well-known virtues: 'Tis thou who dost accomplish miracles and things that are beyond the power of man, who givest children to him that hath none,' or 'Tis thou who hast created magic, and established the heavens and the earth and the lower world; 'tis thou who givest the means of saving all.' The god was adjured to 'hear the prayer' (and this formula is, in the present writer's opinion, decisive proof that the various stelae on which ears [sotni] are found are, after all, the same discussion on that point, votive offerings of the worshippers whose supplications the god had heard [sotoni] in cases of dreams by incubation). After these invocations, the inquirer waited for the god to come and answer him in sleep.

There is one important point still obscure. We do not know whether, as in so many other savage and semi-savage religions, the consent of the dream was solicited by the swallowing of some narcotic or intoxicating substance (see Taylor, J.C.S. London, 1897, p. 128). Locate the stelae in the two frequently quoted conditions—prayer and fasting—the former has been discussed. As regards fasting, it is almost certain, from a number of evidences, that the food was indispensable to the worshipper desiring a dream. It was originally based, as in uncivilized religions, on the idea that a man should give a pseudo-scientific interpretation to the hypnagogic to dreams caused by fasting; therefore it developed into the idea of moving to a more elevated state of existence. The formulas used are, in fact, the same as those used in the other cases (see Petrie, Personal Religion, 'The Ascertics,' p. 70, for the idea of fasting in general in the Egyptians of the later period).

The god next appeared in a dream. The usual formula is: 'The god N [or 'some one,' instead of the Divine name honorai causa] spake to him, saying .... The deity begins, as a rule, by specifying the identity and the name of the person addressing: 'Art thou not such an one, son (or father, or wife, etc.) of so and so?' (cf. Maspero, Contes populaires, Paris, 1905, p. 137, for the dream of Mahbattakhi, and p. 147 for the dream of Sorus, son of Panishi). When this is settled, the god next tells what should be done 'when morning comes,' and he uses no dark or symbolic language; indeed, it is with much explicit detail that he tells, e.g., at what place a sealed stone will be found, or a certain kind of box, containing a certain book, which must be copied and replaced, to be followed by a certain result, etc. The divinatory dream of an oracle of the type for interpretation is thus a case of oniroscopy, not requiring a metaphysical interpretation, but with the direct instructions of the gods in clear terms. It is by these examples also that the sense of the passage of Hermes Trismegistus is established, referring to 'these prophetic statues which foretell the future by dreams and otherwise.'

DREAMS EVOKED BY MAGICIANS.—Besides these official methods of soliciting dreams from the gods, private magic taught means of obtaining dreams without recourse to the lothier temple procedure. The papyri of later centuries have preserved descriptions of material details and barbarous jingles of words that formed the clearest of these methods.

Papyrus 123 in the British Museum, L. 529 ff., says: 'Take a clean linen bag and write upon it the names given below. Fold it up and make it into a lampwick, and set it alight, pouring pure oil over it. The words to be written are: 'Armuth, Luathlanonch, Anrenophrenh, Phtha, Archenthcthcth.' Then without touching the food, light the lamp and repeat seven times the formula given below, then extinguish it and blow all the smoke upon a lamp, giving none to burn, as I adjure thee.' (cf. Budge, Egypt, Magic, London, 1900, p. 216.)

Magic also taught analogous formulas of dreams on unspecified subjects from the gods of dreams. Res, whose figure is carved or engraved on numerous pillows on which Egyptian heads reclined. With these formulas we enter imperceptibly the domain of pure and simple superstition and the current practices of Egyptian society.

The same British Museum papyrus gives, in L. 64 ff., the method of dreaming 'on the left hand' (mummiform) writing on a piece of cloth, with ink made of special ingredients, a formula accompanied by signs; 'This, who givest children to him that hath none, or 'This who has created magic, and established the heavens and the earth and the lower world; 'tis thou who givest the means of saving all.' The god was adjured to 'hear the prayer' (and this formula is, in the present writer's opinion, decisive proof that the various stelae on which ears [sotni] are found are, after all, the same discussion on that point, votive offerings of the worshippers whose supplications the god had heard [sotoni] in cases of dreams by incubation). After these invocations, the inquirer waited for the god to come and answer him in sleep.

It is doubtful whether the more enlightened members of the Egyptian religious sects, whose gods lent themselves so readily to the commands and threats of men. It is universally admitted, on the other hand, that the dead, who always had power to come and give dreams to the living on their own initiative, were capricious, in common with the cumstances, of being called into the service of private magic.

Cases of direct intervention by the dead are not of great frequency in the literature at present known to us. The view of Pierref (Dict. d'arch. égyp., Paris, 1875, s.v. 'Songs'), that the hallowed papyrus of 'The Teaching of Amenemhet' has reference to an appearance of the 18th-lower, who came in a dream to instruct his son, is nothing more than hypothesis. The same is the case with the frequent references to a deceased man (this may have been a waking vision). The most certain cases of dreams adjured by the formulas found by Erman in the Berlin magic papyri are of dreams adjured for driving off the ghosts that torment children in sleep (see art. Contes populaires). The last papyrus of the Louvre, 3292, is, however, of a dead man (this may have been a waking vision). The most certain cases of dreams adjured by the formulas found by Erman in the Berlin magic papyri are of dreams adjured for driving off the ghosts that torment children in sleep (see art. Contes populaires).

The god next appeared in a dream. The usual formula is: 'The god N [or 'some one,' instead of the Divine name honorai causa] spake to him, saying .... The deity begins, as a rule, by specifying the identity and the name of the person addressing: 'Art thou not such an one, son (or father, or wife, etc.) of so and so?' (cf. Maspero, Contes populaires, Paris, 1905, p. 137, for the dream of Mahbattakhi, and p. 147 for the dream of Sorus, son of Panishi). When this is settled, the god next tells what should be done 'when morning comes,' and he uses no dark or symbolic language; indeed, it is with much explicit detail that he tells, e.g., at what place a sealed stone will be found, or a certain kind of box, containing a certain book, which must be copied and replaced, to be followed by a certain result, etc. The divinatory dream of an oracle of the type for interpretation is thus a case of oniroscopy, not requiring a metaphysical interpretation, but with the direct instructions of the gods in clear terms. It is by these examples also that the sense of the passage of Hermes Trismegistus is established, referring to 'these prophetic statues which foretell the future by dreams and otherwise.'

The magicians took full advantage of this readiness of the dead to evoke dreams. They did not employ all ghosts, but only those whose wretched condition and description of their habits, family, cult, or tomb, and who had consequently to beg assistance of the living and to put themselves at their service in order to exist (see DEMONS AND SPIRITS, Art. Egyptian). The most important attachment in necromancy to the spirits of shipwrecked people, suicides, executed criminals, etc. Most of the Egyptian books of magic include private formulas for sending dreams in this way (cf. the Louvre papyrus 3292, the Gnostic papyri of Leyden, and the late incantations in Greek). The dreams thus sent belong to two general categories; (a) dreams which torment and devour by witchcraft; and (b) dreams sent by a man to himself, perhaps with an ardent love, to encourage a loved one's fidelity, or to bring hostility to a rival or make him physically impotent. In all such cases the sending of the dream is usually complicated by a casting of spells through the medium of a figure of the person to whom the dream is sent (see Maspero, Histoire, Paris, 1905, i. 213; and the cases of 'love figures' given by Judge in his Egyptian Magic, p. 94 ff.). The whole combines, later on, with Chaldæan, Jewish, and Greek magic to form the involved processes of tabellae devotionis, where dream, incantation, and necromancy are all combined, the dreams sometimes, however, remaining the chief element (cf., on this difficult question, Maspero, Études de myth. et d'archéol., égyp., Paris, 1903, pp. 297, 311; and the fine studies of Revillout, 'Amatorii,' in Revue Egyptologique, i. (1881) 69 ff.). A papyrus in the British Museum commends the sending of love dreams by the method of tracing words with a nail 'taken from a wrecked ship' and then throwing them into the sea, or by incantation before a lamp filled with oil of a special composition: 'I desire to appear in the dream of the daughter of N. . . .' By gradual stages the magic adds to these spells a dream or magic death in his service spirits of demons or of ill-disposed gods, and we see developing the system of black magic
which lasted throughout the centuries in the Mediterranean world and in China.

This general theory of the dreams sent by magicians fits exactly in the accounts of pseudo-Callisthenes relating to the dreams of Alexander, and modifies the Egyptian nature—mistakenly contested—of the dreams that were sent to Olympia and to Philip. The first dream, sent to the queen, is accompanied by a ceremony of spell-casting with a wax figure and unctions of magic herbs analogous to all the previous accounts included above. The dreams of Anuk to the queen's room is purely Egyptian, and falls in with the theory of Divine conceptions by dreams described at Luxor and by Joüon. Yet Scaliger's idea was confirmed by Masson and Maspero. Finally, the dream in which the hawk is sent from Egypt to announce the birth of Alexander was equally in agreement with the mechanism employed by the magicians of the Nile Valley.

6. General.—It will be observed that in none of the cases mentioned as yet do we see an ordinary living person taking any part at all in a dream (giving a warning, coming from a distance, announcing an approaching death, etc.); there is nothing of the nature of the interview of Patroclus and Achilles (II. xxiii. 65 ff.). And, on the other hand, we have no Egyptian examples of the dreamer going to a distant land in his dream, except on a very few occasions during future events, or, in a word, playing any of the parts that are so frequent in dreams of other religions. Besides the dreams already mentioned, in which the dead appear, the only other apparitions seem to have been those of gods directing or giving general ideas in the clear language of earth, and, sometimes, but more rarely, calling the attention of the sleeper to certain symbolic figures that must be interpreted. We now come to the final question of what theory was probably held in Egypt as to the mechanism of the dream. No formal explanation has ever been given of this in any Egyptian text known to us, and there is little chance that there ever existed an exegetical work analogous to those possessed by the Mediterranean world. The Egyptian dream is not connected rationally either with the mechanism of omens, or with the theory of 'influences,' or with the process of 'intelligents.' It is a tangible reality and is regarded as such, without mysticism and, as a rule, without symbolism. There is not even any allusion, as by Penelope in the Odyssey (xix. 500 ff.), to the possibility of a fallacious dream. On the other hand, the absence of dreams in which the soul goes away or in which living persons appear is significant. It is perhaps true that the absence of the dead, or of other men, must have had dreams of this type, the fact that they omit to mention them in the texts proves that they did not consider them of importance. Now, if we admit, with Taylor (Prim. Cult. i. 121, 440; ii. 49, 75, 416), that these types of dreams are included in the list of the fundamental elements of primitive religious phenomena, it must be concluded that Egypt was already far beyond these concepts, in this connexion, from the ideas as to the rôle and nature of dreams cherished by the majority of contemporary African peoples. In the last place, the theory of the sleeping state, as present writer, after a careful examination of the Egyptian ideas, to be based not upon the separation or the journey of one of the souls of a human being during sleep, but upon the hypersonsiveness of the sleeping man. This fact may be of great interest for the history of comparative religion. There would seem to correspond, in short, to the sleeping state a special sensitiveness enabled an individual to see and hear beings that are always in existence, but cannot be perceived in a waking state because the senses are too gross. This would agree with the belief that on certain occasions or by certain processes man can actually acquire this lucidity, by way of exception, in a waking state (e.g., 'to see invisible spirits' by rubbing the eyes, or 'to read sealed writing' through the matter of the case, etc.). The whole hypothesis agrees, however, with the practice that we have established as fact or suspected as preliminary conditions in Egypt of other magical processes (as intoned form of incantation), fasting, etc. The whole question would thus come under the general theory of the ecstatic process. Far from being, as in other religions, a device for obtaining contact with Egypt was a state of lucid supersensitivity of the various souls contained in the individual. In support of this view, there is a very important phenomenon to be noted, viz. the ecstatic sleep of the sam, so often described or represented in the ritual and in the scenes of the famous ceremony known as the 'Opening of the Mouth of the dead.' It is during this sleep that the sam acquires the power of seeing and hearing the soul of the dead in all the forms which it takes, as the dreamer declares on awaking.

GEORGE FASCART.

DREAMS AND SLEEP (Tentonic).—Dreams played a considerable part in the lives of the Tentons, but their significance was only prophetic. They were thought to foreshadow events in the future of the dreamer or his immediate surroundings, but there is no hint that they played any part in religion. The idea that revelations as to the nature of the gods could be made through the agency of dreams seems to have been foreign to Tentonic conceptions, and the later mystical dreams of the Middle Ages must, therefore, be held to be a Christian growth. In Scandinavia, whence almost all our information for heathen times is obtained, dreams were not only divorced from religious considerations, but were regarded as the work of the wise men, or of magic. The art of interpreting dreams was in no way connected with magical powers, but was usually found in combination with a philosophical attitude towards life, or spirituality in connection with the afterlife. Thus, in the Laxdala Saga, Gudrun appeals to no witch-wife, but to Gest the Wise, a chief universally esteemed for his ripe wisdom, for the interpretation of her dream; and in the Hethmarringla we find King Halfdan the Black consulting his wisest counsellor about his dream. Every one, however, was acquainted with the rudiments of the art of interpretation, and there seems to have been a general consensus of opinion as to the significance of certain phenomena in dreams: thus Gudrun, in the Lay of Atli, says that dreaming of iron portends fire; and Hógni, in the same poem, declares that his wife's dream of a polar bear only foretold a storm from the east. The fact that most of the recorded Scandinavian dreams are of ominous import must be ascribed to the selective process exercised by the authors of the Saga or poem. But it is a fact that dreams were used as a literary device to deepen the atmosphere of doom which surrounds a fated house, was fully appreciated by them. So, before the catastrophic ending of the Atl (Atels) poems, the wives of Hógni and Gunnar in vain strive to stay their husbands by
the recital of their dark dreams; and the unsuspecting Athi wakes Gudrum to tell her the dream which foreshadows his own death at her avenging hands. In many of the Sagas the suspense before the recital of the dream is heightened by the manner in which the glory of the royal line in the dream of a lofty tree, many-branched, spreading all over Norway and beyond it. Saxo Grammaticus, in his Gesta Danorum, tells us of a dream of King Gorm of Denmark which has a similar significance, and one is also recorded from Sweden.

It is worth while to examine a little more closely the various classes of foreboding dreams. The simplest type is merely a dream vision of what is to come; thus a great blaze indicates the burning of a house, and so on. But the dreams most frequently mentioned in the old Scandinavian sources image forth the persons involved under animal form, showing how deeply rooted was the idea of the fylgja, the materialization, as it were, in animal form, of a man's spirit, which attended him through life, and could be seen in dreams, or by him before the death of its owner (see Soul). Thus, in Njáls Saga, a dream of a bear followed by two dogs is at once read as showing the presence, in the neighbourhood, of the warlike spirit of the two companions, Thróndinn and Eglissón, in the Gyllnagö Saga, dreams of two eagles fighting over the possession of a swan: the eagles are the fylgjur of the two rivals for the love of his daughter, whose fylgja is the swan. There is in other cases a remarkable similarity between this dream and that in the Nibelungenlied, where Kriemhild sees two eagles tear her pet falcon to pieces. Charlemagne's dream of the meeting of a bear and a leopard, recorded in the Song of Iceland, evidently belongs to this class. In other dreams, again, it is the guardian spirit, or a deceased member of the family, who appears to the living representative to warn him of danger or death—in two stories the warning conveyed is of a landslide, from which the dreamer is thereby enabled to escape. In later Christian times we find St. Olaf or one of the popular Icelandic bishops fulfilling this warning function. In the old Icelandic tale of Thórsfinn, three female guardian spirits come weeping to Thórsfinn, imploring him to be wary, for that his thrall Gilli seeks to murder him; but the warning is in vain. Similar is the last dream of Glandrian, the hero of Lay of Atholl, in which she sees dead women, clothed in sad-coloured woods, come to call her husband Gunnar to the realms of the dead. It is characteristic of the stern Teutonic conception of the workings of Fate that dreams are only seldom warnings to be profited by; often they are foreshadowings of an inevitable doom. The gods never appear in dreams until faith in their divinity has been extinguished by Christianity. On the other hand, we must note that evil dreams beset the god Balder before his death (Vegavanskyöa, in the Older Edda). Nightmares were not classed as dreams among the Teutonic peoples, but (and indeed frequently are) attributed to the actual presence on the bed of a supernatural being, a mara, alp, or trude, or to the witchcraft of an ill-disposed neighbour.

In Scandinavia, where the interpretation of dreams was a secular art, unconnected with either magic or religion, the introduction of Christianity did not lessen the esteem in which it was held. Thus it is evidently no disgrace to the Icelandic bishop St. Thorkill that he took great pleasure in the recital of dreams. In England, however, the study of dreams is denounced by an early archbishop, together with magical practices, soothsaying, and the like. That it held a lower place in England than in Scandinavia seems also clear from the absence of dreams as a literary device in Old English prose; in German literature the Nibelungenlied affords evidence for the same view on dreaming as prevailed in Scandinavia; but, on the other hand, we find Walthier von der Vogelweide, who, in his courtly, knightly poems, addresses himself to wise women who professed to interpret them. At the present day, however, Germany is full of 'Traumbucher,' giving rules for the interpretation of dreams, and especially as to the methods of detecting, in some detail of a dream, a lucky number in the State lotteries. These books have an immense sale, and it is a significant fact that in some parts of Germany the lottery agents themselves sell 'Traumbucher,' and that in Austria they have been forbidden by law to do so. In Francenia, the interpretation of dreams for lottery purposes is a kind of secret knowledge, very profitable to its possessors.

It is a firm belief in most Teutonic countries that to sleep in a new house, or at least in a new bed, is the best method of securing a dream; it was the method known in the Middle Ages, and was recommended in the heathen times. A curious variant of this practice was adopted by King Halfdan the Black. This Norwegian king slept in a pig-sty in order to cure himself of a dreamless sleep, which was considered a disquieting mental disease. In some parts of Germany it is thought that, if the dreamer refrains from telling a bad dream until after midday, its accomplishment will be prevented. The frequent refusal of persons in the Icelandic Sagas to relate their dreams, or their protests of disbelief in dreams, may possibly be due to a similar idea. Without parallel in Teutonic sources is the death-bringing dream mentioned in the Icelandic Ljósævinga Saga, where the dream had such power that the first person who heard it must die.

Certain nights, whose significance dates from heathen times, are considered the most important for dreams almost all over Teutonic Europe, especially the Twelve Nights (the heathen Yule), and Midsummer Night. Both in Sweden and in Germany it is the custom to lay a bunch of nine or eleven variegated flowers under the pillow on Midsummer Eve, to ensure that the dreams of the night shall come true.

**LITERATURE.**—W. HERZOG, Über die Träume in der altnordischen Sagenquelle, Leipzig, 1896; F. von WISSO, Völkerkunde der Gegenwart, ed. Berlin, 1902; J. Grimm, Deutsche Mythologie, Berlin, 1879-78; D. SCHRADER, Generalatlas der indogermanischen, Germanisierenden und slavischen, Wissenschaft, 1915, xvi. **DREAMS AND SLEEP (Vedic).**—The chief passage in Vedic literature for the explanation of the psychology of dreams in Brhadārataparvasa Upaniṣad, iv. 3. 9-14. Two theories are advanced: (1) in dreams the soul takes its material from the world and constructs for itself by its own light the objects which it sees; (2) in sleep the soul abandons the body and roams where it will, hence the injunction not to awaken suddenly one who is sleeping, for in that case the soul may not find its way back to the body—an evil which is hard to cure. For the later workings over of this passage in the attempt to harmonize these theories, see DUESSEN, Allgem. Gesch. der Philos., 1894 ff., ii. 271-274. For the present purpose the second hypothesis is not important. Its difference from the first theory is ascribed by Duessen to the poetic form in which it is presented. More probably the difference is deeper, and we have in these verses a poetic version of an extremely old belief frequently found, the idea that under a high stage of civilization, the existence of which among
the Vedic peoples must be posited to explain the efforts made, from the Rigveda onwards, to remove the fancied effects of evil dreams.

The Rigveda and in the Atharvaveda speak of an evil dream (dush-
scapna, duhsepyapnya) as a calamity comparable with sin, disease, and witchcraft, or are employed in the ritual for the expiation of it. From the Rigveda may be cited vi. 8-9, 99, 114, 1.
120, ii. 28, 10, v. 82, 4-5, viii. 47, 14-18, x. 36, 4, 37, 4, 127, 1 (the Rātriśukta, or rather its khaṇḍa), and 164. 1. The thirty-third Pārīṣṭhā of the Atharvaveda gives a list of hymns that destroy the effects of evil dreams: Atharv. iv. 17, 5, vi. 45, 1, 46, 1, vii. 100, 1, 108, 2-5, ix. 2, 3-3, x. 3, 6, xvi. 5, 1, and, as far as the abschnitt-matter is concerned, might have included also: vi. 121, 1-7, vii. 83, 4, xvi. 5, 2, 8-9, xix. 56, 1, 57, 1. The last two hymns are employed in this ceremony called svastayāga, performed each morning to secure good fortune for the king (cf. Atharv. Par. xii. 1, 5). 'For the most part these stanzas contain little that is distinctive. Typical is Rigveda x. 37, 4: 'O Sūrya, with that light with which thou dost conquer darkness, with that which is termed the fire of auras, that is, the light of the sun, the source of life and warmth, which, it is said, is possessed by all living creatures, with that drive away from us all weakness, impurity, disease, and evil dreams.'

In the hieratic literature the manipulation of these stanzas in the ritual is also quite commonplace. Thus at Aitareya Aranyāka, iii. 2, 4, 18, one who has had an evil dream is ordered to fast, cook a pot of rice in milk, make oblations of it, each accompanied by a verse of the Rātriśukta, feast the Brahmanas, and cast the leavings of the oblation. Similar directions are given in Śankhāyana Grhyā Sūtra v. 5, 3-13, with the additional requirement that the milk must be from a cow that is not black and that has a calf of the same colour. Furthermore, Rigveda i. 89, 8-9 must also be recited. In Aśvalāyana Grhyā Sūtra iii. 6, 5-6 the oblation is of rice grains, and is made to the sun with Rigv. v. 82, 4-5, viii. 47, 14-18, or ii. 28, 10. With the first of these verses Śāmsāvada i. 141 is identical. Its muttering is prescribed at Gobhila Grhyā Sūtra iii. 3, 32 (cf. Śāmsāvadāna i. 8, 7) in case of bad dreams. Hiranyakṣevi Grhyā Sūtra 1. 17, 4 orders in a similar case a sacrifice of sesam and diya, accompanied by verses, one of which is equivalent to Atharv. vi. 101. Similar is the practice of Mānas Grhyā Sūtra iii. 15. Kātiyāyaṇa Sṛvanto Sūtra xxv. 11, 20 in the same case directs the Brāhmaṇa (of whom the benediction that consecrates him for the performance of a sacrifice) must mutter a verse practically equivalent to Atharv. vii. 100. 1 (cf. also Āpstiṃkarmiya Sṛvanto Sūtra x. 13, 11). The Rigvedākha i. 25, 2, 24, 1, 25, 1, 30, 1, ii. 33, 2, iv. 20. 1 also join the muttering of a number of verses to destroy the consequences of evil dreams. Noteworthy also is the fact that Śankhāyana Grhyā Sūtra i. 7, 2 includes most of the verses from the Rigveda in the list of verses to be recited each morning.

In the Atharvan ritual the ceremonies are more striking; of them Kauṭikās xvi. 9-13 gives a list. Vishnu is a bodhisattva; he is the god who has had a bad dream which has washed his face. When the dream was very bad, he offers with these hymns a cake of mixed grains, or deposits, while reciting the hymns, such a cake in the land of an enemy. On the stroke the Brāhmaṇa sends forth the elements: honey or chews stalks, or wears a single (red) lotus, or drives a chariot harnessed with asses or bears, or, wearing a wreath of red flowers, drives a black cow with a black calf towards the south (cf. Aitareya, ZDMG xliii. 18). Thus the actual discomforts of the requirement (see above) that dreaming of eating shall be followed by an expulsion is doubtful. Caland regards it as an omen of lack of food, on the principle that dreams go by contraries. But dreaming of eating is in itself a good omen (cf. Pischel, Album-Kern, Leyden,1903, p. 115 ff.). Pischel’s explanation, that it is the failure to find

is stated that Indra formerly suffered from such dreams until the Gṛhyākṣevi afforded him relief.

The ceremonies show that their purpose is not to secure immunity from the actual effects of dreams, but to prevent the imagination of the effects of dream. This view is but the logical result of the old notion that in dreams the soul leaves the body and actually undergoes the experiences which the waking mind remembers with the Vedic belief that sin is not only a moral delinquency, but much more, a quasi-physical contamination. Under these circumstances an excursion into dreamland must have appeared to the Vedic mind as fraught with possible dangers. The methods taken to remove them naturally resemble the attempts to remove actual impurities, physical or spiritual—viz. ablutions and the transferring of the burden to another. The latter means, which is symbolized in the Atharvan ritual by the depositing of the cake of the enemy’s land, is expressed in the Rigveda itself, vii. 47, 14-18, by the prayer to Uṣas (Dawn) to transfer the evil dream to Tīrta Aptya, the scape-goat of the gods. For this mythological concept the Atharvaṇe and in particular the Gobhila Brahmana suggests that the last stanza is a human enemy. In some cases apparently the contamination arises from association with spirits of the dead. Thus at Śatapatha Brāhmaṇa xiii. 8, 4, 4, persons returning from a funeral, among other precautions to escape the unclean influences, wipe themselves with an apamārga plant, implored it to drive away, among other evils, bad dreams. The association with the world of Vayna may also be seen in Atharv. vi. 46, xix. 56; and it is most probable that the ‘friend’ of Rigv. ii. 28, 10 (= Mahārājan Śivatiḥ ii. 229, 3) who speaks to one of danger in sleep, and against whom Vayna’s protection is implored, is a departed spirit.

Auspicious dreams naturally appear much less frequently in the ritual. At Chhandogya Upaniṣad v. 2, 8-9 it is stated that if, during the progress of a sacrifice intended to procure the fulfillment of a wish, the sacrificer sees in his dreams a woman, he may infer the success of his sacrifice.

Divination by means of dreams is attested by Śāmsāvadāna iv. 1-4-2-2, where two ceremonies are described that ensure prophetic dreams.

Dreams as omens.—That the interpretation of dreams must have begun to occupy the attention of the Brāhmaṇas at a very early period is implied by the fact that a certain dream character is an omen of an ornament, or the weaving of a garland (for explanation of these omens from the later literature, cf. Pischel, ZDMG xl. 111). The Atharvaṇa Arāṇyaka ii. 4, 2, 16 ff. gives a number of dreams that forebode death; e.g., if a person sees a black man with black teeth and that men kills him, if a bear kills him, if a monkey jumps on him, if he is carried swiftly by the wind, if he swallows gold (symbolic of the wealth and the character of the subject), if he eats honey or chews stalks, or wears a single (red) lotus, or drives a chariot harnessed with asses or bears, or, wearing a wreath of red flowers, drives a black cow with a black calf towards the south (cf. Aitareya, ZDMG xliii. 18). Thus the actual discomforts of the requirement (see above) that dreaming of eating shall be followed by an expulsion is doubtful. Caland regards it as an omen of lack of food, on the principle that dreams go by contraries. But dreaming of eating is in itself a good omen (cf. Pischel, Album-Kern, Leyden,1903, p. 115 ff.). Pischel’s explanation, that it is the failure to find
in the morning the food dreamt of which constitutes the omen, seems forced. The commentator
who wrote that (Atharv. vii. 106) he looks around as if he had eaten food, suggests a
different explanation. His soul has incantiously
eaten food—an act surrounded by superstitious
practices because of the supposed danger of the
enemies (the Parulaka and others) but, the Aborigines
of the tropical type of the Indian face and head;
migrants from lowlands to uplands develop round-
headedness; from the temperate zone to the tropics
man develops frizzly hair, and so on. The most
obvious of these innate adaptations, physically
logically produced, to the environment is pigmentation.

The skin of man is graded in colour from the
Equator to the Pole. The deeper pigmentation of the
tropical skin is a protection against the
actinic rays of the sun; the bluntness of northern
races, like the white colour of Arctic animals,
retains the heat of the body.

If we followed the analogy of the animal, we
should have to take into account the fact that a
mechanical intelligence enables it to obviate certain
disadvantages of its natural covering. The animal
never exposes itself unnecessarily; its work, in
the case of the larger animals, is done at night, not
in the glare of the sun. Automatically it acquires
an artificial covering in the form of shelter. If
man in a natural state followed a similar principle,
he would be at no more disadvantage than is the
animal. A deeper argument applies to the use
mentioned above, namely, sexual decoration.

What these considerations suggest is that man was
not forced by necessity to invent. The reason is
that at once decor and instinct, and the latter
more. The conclusion is that primary use and meaning of
dress is not so much to provide an adaptation to a
climate as to enable man to be superior to weather;
in other words, to enable him to move and be
active in circumstances where animals seek shelter.
The principle is implicit in the frequent proverbial
citation of clothing to a house.

Dress, in fact, as a secondary human character,
must be treated, as regards its origins, in the same
way as human weapons, tools, and machines.
Dress increases the static resisting power of the
surface of the body, just as tools increase the
dynamic capacity of the limbs. It is an extension
and (thereby an intensification) of the passive area
of the person, just as a tool is of the active mechanism
of the arm. It is a second skin, as the other is a
second hand.

Further, if we take an inclusive view of evolution,
accepting no break between the natural and the
artificial, but regarding the latter as a sequence to
the former, we shall be in a position to accept
indications that both stages, and not the former
only, are subject to the same mechanical laws, and show (with the necessary
limitations) similar results. These laws belong
to the interaction of the organism and the
environment, and the results are found in what is called
adaptation, an optimum of equilbrium, a balanced
interaction, between the two. In this connexion
we may take examples from two well-marked
stages in the evolution of our subject, the
one showing a deficiency, the other a sufficiency of
the artificial covering of the body. A good observer
remarks of the Indians of Guiana, not as a result
of habituation, but as a first impression of their
naked form:

'At the Chaco Indians:

'The Indian is perfectly suited to his environment; even his picturesque costume and the ornamental painting with which he adorns his body is in perfect harmony with his surroundings. The colours blend so beautifully that there is no doubt whatever
that the Indian is of the highest type of culture, a very great degree, the idea of
fitness and harmony.'

If we qualify in the last sentence the word 'idea'

J. E. F. Im Thurn, Indians of Guiana, 1853, p. 194.

W. H. Gregory, Evolution People in Northern Land:
The Indians of the Paraguay Chaco, 1911, p. 65.
by the adjective 'automatic,' or 'unconscious,' we shall have a sound explanation of a very remarkable phenomenon. The evolution of man's artificial covering maintains a balance or harmony with the environment, particularly in respect to light, just as was the case with the naked Indian skins, arrived at purely medicinally, but through the unconscious reaction of the retina. Thus, there is a real continuity between the adaptive colour of the chameleon, and similar cases of so-called protective coloration. But it is primarily a mechanical actuating the environment), and the harmony which human dress may show with its surroundings. The selective process has not been conscious, but neither has it been accidental. It is the result of law. Equally unconscious in its first stages was the adaptation of dress to temperature.

This brings us no nearer to the origins of dress, though it clears the ground. Still further to simplify speculation, we may notice some prevalent hypotheses on the subject. Dress being a covering, it assumes, when instituted, all the applicable meanings which the idea of covering involves. But it follows that, as such, or as any, were responsible for its original institution.

There is, first, the hypothesis that clothing originated in the decorative impulse. This has the merit of being a fruitful idea. Though unconscious, it would operate through unconscious intelligence, automatic feeling. Stanley Hall found that of the three functions of clothing whose realization and expression he investigated (protection, ornamentation, and Lotze's self-feeling—the second is only for the most conspicuous in childhood. The child is unconscious of sex, otherwise this statistical result might be brought into line with the sexual ornamentation of animals. And, though it is unsafe to press any analogy between the civilized child and the savage, the savages known to science are, as a rule, very fond of finery, absolutely, and not always in relation to the other sex.

'The natural man,' says Ratzel, 'will undergo any trouble, any discomfort, in order to beauty himself to the best of his power.'

Dandies, in Thurn remarks, are about as frequent in the Indians as in civilized communities. At Fort Moresby, in New Guinea, young men actually practiced and encouraged it, to be smart and fashionable. In these spheres, indeed, it is chiefly the young, if not mere children, who express the impulse to decoration. Of the Dayaks of Borneo a good observer noticed that a 'a love of finery is inherent in the young of both sexes; the elderly are less fond of it and often dress very shabbily, and save up their good besides for their offspring.'

'But it is in accordance with the rule among animals that among primitive peoples the male sex chiefly assumes decoration. Ornaments among the Indians of Guiana are more worn by men than by women. The stock ornamentation is paint; scented oils are used as vehicles.

A man, when he wants to dress well, perhaps entirely coats both his feet up to the ankles with a crust of red; his whole trunk he sometimes stains uniformly with blue-black, more rarely red and white. He paints it with an intricate pattern of lines of either colour; he puts a streak of red along the bridge of his nose; where his eyebrows were till pulled them out he puts two big tassels. But that is not all; he puts a big lump of red paint, and probably he scatters other spots and lines somewhere on his face. Down is often used with red paint.'

But this analogy is not to be pressed, though it is sound as far as it goes. It applies, that is, up to a certain point in social evolution. Beyond that point the balance inclines the other way, and for the last five hundred years of European civilization decorative dress has been confined to women. During a previous period of some centuries—to be regarded as only a very preliminary stage, the only did the curve of luxury in dress reach its highest point, but there were attempts—spasmodic, it is true—to put down any tendency towards such luxury on the part of women, prostitutes being especially proscribed. But in our exceptional—growing, at any rate—considerable group of cases the rights of the husband. Thus we may infer, that in the last stage, woman as a sex has not only gained freedom, and the right to decorate, previously possessed by the courtesan alone, but has also shifted the balance of sex to a more permanent and efficient position. The story of woman's unconscious struggle for a monopoly of beauty in dress thus illustrates an important social movement.

In practical investigation it is difficult, as Ratzel observes, to say 'where clothing ends and ornament begins,' or, on the previous hypothesis, where clothing springs out of ornament. Since either may obviously develop into the other when both are ideas, and as such, or as any, were who are responsible for its original institution.

Cases where one or the other is absolutely unknown might serve, but there are no examples of this. If an instance, moreover, of the presence of clothing in its original form is observed, it would be impossible to argue that clothing cannot be subject to the decorative impulse. In any case, there is the self-feeling, satisfaction, in the impulse to finery is only one phase of it.

The supporters of the ornamentation hypothesis of the origin of dress have an apparently strong argument in favor of the Brazilians and the Central Australians. They recently studied peoples possess no clothing in the ordinary sense of the term. But they wear ornament, and on special occasions a great deal of it. Brazilian men wear a string round the lower abdomen, the women a strip of bark-cloth along the perineum, tied to a similar abdominal thread. This is sometimes varied by a small decorative enlargement. The Central Australian man wears a waist-string, to which is tied a white tassel. Corresponding to the last in the case of the women is a small apron. Leaving the waist-string out of account, we have remaining the question of the orogenus centre. In both the ornamentation hypothesis and the concealment hypothesis this centre is the focus of speculation. If the Australian tassel of the male sex and the leaf-like enlargement of the Brazilian woman's perineal thread are considered superficially, they may appear to be, if not ornaments, at least attractions. But if it be granted, it does not follow that we have here the first application of the idea of dress.

It would be impossible to make out a case to prove that these appurtenances can ever have satisfied the idea of concealment, as on the next hypothesis is assumed. This hypothesis is to the effect, that male jealousy instituted clothing for married women. Ratzel observes that, if clothing was originally instituted for purposes of protection only, the feet and ankles would have been protected first. Clothing, he holds, stands in unsuitable relation to the sexual life; to wear complete clothes is not the man, who has to dash through the forest, but the married woman. The primary function of her dress is to render her unattractive to others, to conceal the body from other men's eyes. In the lower strata of human evolution he considers that dress as a protection from rain and cold is far less common.
DRESS

But, if we may argue from the practice of exist- ing savages, this hypothesis cannot hold even of the origin of female clothing. For we can, in fact, apply it to that of men. It is certainly a vera causa, at a certain stage in barbarism (the stage when wives became property), of the custom of making and selling women, and of confiscating all a maiden's ornaments and finey when she became a wife. But it does not explain the origin of the small apron worn in very early stages, or of the mere thread in the earliest, and we cannot deny these articles a place in the category of dress.

A frequent corollary of this view is that modesty is a result, not a cause, of clothing (so Sergi). But, as Havelock Ellis observes, "many races which go absolutely naked possess a highly developed sense of modesty." Andamanese women are so modest that when they want to undress to bathe or attend to their personal needs, they retire either from sight or put the new over the old, and then sit or lie down. Modesty in its original independence of clothing is, possibly, a primitive hypothesis, but it is still preserved. Physiological modesty takes precedence of anatomical modesty, and the probability of modesty is developed long before the discovery of any other ornaments or garments. The rise of clothing probably had its first psychological basis in the mental reaction of modesty already sufficiently formed of the "natural," bare, person. Modesty, as it were, is a sublimated and idealized sense of the anatomical modesty of women.

This last statement, of course, cannot hold of the ultimate genesis of clothing. But, once instituted, it was sure to coincide with emotions of modesty. Hence, though modesty and dress is a subject of little importance, except in so far as it has involved the creation of false modesty, both individually and socially, and with the advent of the new body-covering, dress, some importance attaches to it. When clothing is once established, the growth of the conception of women as property emphasizes its importance, and increases the anatomical modesty of women. Waltz holds that modesty is the primary origin of clothing, and therefore of modesty. Diderot had this view. Often married women alone are clothed. It is as if before marriage a woman was free and unmastered; after marriage, clothed and a slave. It is as if before marriage a woman was free and unmastered; after marriage, clothed and a slave.

The garment appears—illogically, theoretically—morally and physically, a moral and physical protection against any attack on his [the husband's] person. But the fact of dress serving as concealment involved the possibility of attraction by mystery. Even when other emotions than modesty, emphasized by jealousy, increase, they may work together for sexual attraction.

The social fear of trepassing disgust combined easily and perfectly with the instinctual one, so that there is a double object of concealment and attracting. It is so with the little apron of the young savage. The brightness of the attraction is indeed a logical outcome of the fear of evoking disgust.

Similarly we find in the most primitive clothing a curious inter-mixture of concealment, protection, decoration, and advertising. As has been hinted when an aperturesence has come to be attached to the sexual area, the resulting psychical reactions are significant. In the previous natural stage there is no such addition to the natural stimulus, first by sexual attraction or signification, and later by decoration or veiling. In the mind of the subject also there comes the consciousness of sex, and later the enhancing of self-feeling, which is the case of dress generally, and not merely sexual, is distributed throughout the personality. The subject's material personality is increased by clothing, and his psychi- cal reaction is proportional to this. The result is this rich complex by straining the balance between himself and others, the balance between himself and the women. The balance between them varying according to circumstances. But it is highly improbable that such impulses could have a place, except to the ritual, to the decoration, and of attachment and expres- sions. Their only means of expression would have been ornament.

Finally, there is the protection-hypothesis. Su- dden falls in temperature, rains and winds and burning sunshine, the danger of injuring the feet and the skin of the body generally when in the forest, and the need of body-armour against the attacks of insects and of dangerous animals seem obvious reasons for the invention of dress. But they do not explain the process of invention, which is the main problem. The cloak, the skirt, the apron, cannot have been invented in answer to a need, directly, without any stages. The invention of cloth was first necessary, and this was suggested by some natural covering. The only line of development which seems possible is from protective ligatures. There are numerous facts which only an independent origin in the decorative period, like the necklace. Here and there we find bands of beads round the ankles, knees, wrists, and elbows, the object of which is clearly to protect the skin and muscles from strains. The use of a strained muscle being caused by the ligatures, the suggestion of an artificial grip might naturally follow, and a system of ligatures would be the result.

The Negra wear black rings of cane round the knee—say, to give strength for climbing. The Malaya wear bands and ligatures to protect the muscles and prevent strains, as, for instance, round the wrist and the body. But the idea of an arm-ring is probably in use in striking and wearing of blows, but the idea of a cestus is unlikely to be the primary motive for ligatures. The Chacoes wear anklets of feathers, chiefly to protect their feet against snake-bites.

Wild peoples, in fact, understand quite well the limitations and the capacity of the human organ- in in respect to the encasement. We may credit them with an adequate system of supplying natural deficiencies, and of assisting natural advantages also. For instance, the Malays explain the object of the parasol, as preventing too much sun upon the head.7 The women wear cabunds (cane) or iron wire, representing a weight of many pounds. The women wear heavy bracelets of brass.8 It is possible, also, that in certain cases dress itself might have been developed from the same source. Thus, when we compare the following type of body-dress with the frequent use, in earlier stages, of a plant bough or cane as a girdle, we can imagine the possibility that the invention of the sheet-form of covering might have been delayed by the extension of the bandage-form.

The term of bandol, of the Satarang women, is a series of cane hoops covered with innumerable small brass links. The series encasing the waist fits close. It sometimes extends right up to the head. They are strung on rushes, and fixed to a cane network inside them. Dense coils of thick brass wire are also worn on the legs.

8. Stend-Hagen, Fagan Races of the Malay Peninsula, 1906, i. 195.
But the ligature as a primary stage of sheet-clothing might have developed merely by adding to its breadth. Given a girdle, we might suppose the use of a belt at the knee or the hips, or at the waist. Among the various bands used by the lowest peoples there is a gradation of the kind. The armbands of the Indians of Guiana are broad cotton bands or strings. Yet there is no evidence to show that such devices were used even to the extent of the connexion of the belt to the skirt. The belt, has been the main origin of the skirt-form of dress. A skirt supplying its own belt is generally a late modification.

Examination of the earliest peoples inevitably leads to a rejection of the ligature-hypothesis. Every consideration goes to show that the earliest ligature was not intended to support the muscles. It is inconceivable that the use of strings in the Guiana example can be intended for such a purpose. In the next place, it must be borne in mind that the chief area of the organism with which dress proper is concerned is the central part of the body, the trunk. Now, the great majority of the lowest peoples known wear no clothes. Shelter is used instead. But there is very commonly a waist-string, and it is more used by men than by women. In most cases it is the point of departure for the evolution of dress, and the mechanism of that departure will be presently discussed. But for the origin of body-clothing it is necessary to find the origin of the girdle. The idea of a girdle at the waist is not an appendage, however broadly the skirt or trousers. This is certainly not its object among the earliest peoples, who have nothing to tie up. It might be supposed that the original purpose of the girdle was that of an abdominal belt, useful both as a muscle-ligature and to alleviate the pangs of hunger. But the earliest girdles are merely strings, and string is useless for such purposes. String, moreover, made of grass or vegetable fibre, or animal sinew or human hair, is an earlier invention than the bandage. Its first form was actually natural, the plant bough or stem.

It is significant that this waist-string is chiefly a male appendage, and that it is worn neither tight nor very loose. Both facts are explained by the purpose for which the string is worn. It is neither a bandage nor a suspender, but a continuous pocket. The savage finds it indispensable for carrying articles which he constantly needs, and which otherwise would encumber his hands. Once fitted with a waist-string, the body, as a machine, is enormously improved, being able to carry the tools of his daily operation and those articles ready for use as occasion requires, without hampering the work of that universal lever, the hand.

We can only speculate vaguely as to the series of "accidents" which led to the idea of the waist-string. It was, no doubt, analogous to the series which ended in the invention of artificial hands in the shape of weapons and tools, but it was certainly much later in time. The varied unconsciously ideas of holding, gripping, and encircling, which the muscular experience of the hand impressed on the brain, might have evolved the principle and practice of a hold-all round the trunk, without the occurrence of any fortunate accidents whatever. The natural position of the hands when at rest would be rejected by unconscious reason in favour of a more convenient spot, slightly higher, which would not interfere with the function of the hands. All downwards tapersing of the thigh, moreover, renders it impossible to keep a string in position. In this connexion it is worth noting that knee- and ankle-bands are used as symbols of the ancestor's wish and the styles of culture for the purpose of holding implements.

The waist-string, therefore, being earlier than clothing proper, and being, as we have suggested, the point of departure for the wearing of coverings, we have next to examine the mechanism of the supposed transition. The girdle as a holder being given, it would serve not only as a pocket, but as a suspender for leaves or bunches of grass, if for any reason these were required. The point to be emphasized here is that the process which suspender would suggest the suspension and therefore the regular use of articles for which there had been no original demand. If, for occasional purposes, a decoration or covering was desired, there was the waist-string ready for use. Central as it was, the decoration or covering would fall below it and be thus applied automatically to the perineal region. Similarly, the hair of the head is a natural holder, though much less efficient, and it is used to support leaf-coverings or flower-decorations.

It is unnecessary to enter upon a description of the various zones of the body which require protection, such as the spine at the neck and in the small of the back, against sun and cold, or the mucous membranes of the perineal region, against insects. The use of clothing of certain textures and colours is partly due to the skin being a thermometer, its temperature varying according to the external weather, and being an index of health. The skin also has a temperature of its own adapted to that of the body, and to neutralize those rays of light which are deleterious to the nervous system and destructive to protoplasm, is also out of place here. We may now pass on to consider the development of the evolution of dress has probably followed a thoroughly hygienic course. But no principles of such hygiene, except the very simplest, can have occurred to the primitive minded man. One of the simplest, however, we may admit for tropical races—the use of a protection against insects. The perineal region is most subject to their attacks when man is naked, owing to the sebaceous character of the surface and its relatively higher temperature. These facts, no doubt, more than anything else, are the explanation of primitive habits of depilation. But depilation is not a complete protection. Something positive is required. The use of bunches of grass or leaves is natural and inevitable, as soon as there is something to hold them, namely, the waist-string. A parallel method is the use of a second string depending from the waist-string in front and behind, and passing between the legs. The Brazilian strip of bast used by women, and the red thread which takes its place in the Trumai tribe, though it attracts attention like ornaments instead of clothing or clothing-like, according to the Steinens also satisfied himself, provide a protection against insects, a serious pest in the forests of Brazil. These inter-crural strings protect the mucous membrane, without, however, concealing the parts, as do leaves and grass. In the present connexion their chief interest is the use made of the waist-string. When cloth was invented, the first form of the loin-cloth was an extension of the inter-crural thread. It may be illustrated from the Indians of British Guiana, though it is practically universal, significantly enough, among tropical and sub-tropical peoples.

The Guiana man or woman's raw strip, called lap; it is passed between the legs, and the ends are brought up at back and front and suspended on a rope-like belt. The women wear an apron, called opaje, made from a string round the waist, and passing between the legs. The Veddás of Ceylon,

1 Unter den Naturvölkern Central-Brasilien, Berlin, 1894, p. 146. For an account of the occurrence of the branch, against insects, see Wilken-Plaete, Handbuch für die Vergleidhende Volkenkunde von Nederlandsch-Indië, Leyden, 1893, p. 47 A.

2 Im Thurn, op. cit. 191.

the later form of loin-cloth naturally superseded the earlier. A length of cloth passed round the waist and between the legs, the ends depending, was both more convenient and more comfortable. In the beginning there seems to have been two articles in one, was more easily kept in position. This is the familiar and widely prevalent loin-cloth. Secondly, it supplied a more efficient method of binding the muscles together, and being two articles in one, was more easily kept in position. This is the familiar and widely prevalent loin-cloth. 1 It may be conjectured, the use of a perineal cloth for men and of a mere apron or skirt for women—a distinction of the earliest date and generally maintained. As showing the practice of such confinement, it is enough to point to a common use of the earlier waist-string. The end of the organ is placed under the string, made tight enough to hold it flat against the abdomen.

The development of the apron and skirt is a simple extension (given the suspensory string and the invention of cloth) of the use of leaves hung from the waist. The frequent use of a rear-apron as a bladder-saving sheet is a hint that it is not without influence upon the skirt, which developed independently. A frequent variation is the fringe. A combination of front- and rear-aprons no doubt prolonged this. When the latter was developed, new methods of suspension were adopted, among them being one similar to that of the loin-cloth, the upper edge serving as a bandage. The use of the waist-string by women, for keeping an inter-erual cloth or tampon in place during the periods, may be referred to; but it did not lead to the development of any article of attire. One example of its use, however, is instructive, as showing how a temporary protection may pass into a regular appendage.

Among the majority of the Nyasa tribes a woman during her periods wears a small piece of calico corresponding to a diaper. The same is worn after childbirth. This is the case generally in Nyasaland. But Angoni women 'always wear them.'

The protection-hypothesis of the origin of dress may thus be adopted, if we qualify it by a scheme of development as suggested above. When once clothing the skin leaves a blank, the loin-cloth upon the abdominal region served to focus various psychical reactions. One of the earliest of these was the impulse to emphasize the primary sexual characters. It is an impulse shown among all the higher anthropoid apes in the majority of early stages in the observations at the attainment of puberty, and it is, as a rule, at that period that sexual dress or ornament is assumed. Among civilized peoples, in the Middle Ages and in modern times, the impulse is well marked by various fashions—the phallocrypt and the tail of the savage having their European analogues. A less direct but even more constant instance of the same recognition is the assigning of the skirt to women as the more sedentary, and trowsers to men as the more active sex. The suggestion sometimes met with, that the skirt is an adaptation for sexual protection, need only be mentioned to be dismissed. The Central African pubic tassel and similar appendages will here find significance, but it is improbable that such accouterment was their original purpose. Once instituted for protection, the other ideas followed. Another of these, which at once received an artificial focus, was the emotion of modesty. It has been observed among the higher animals that the female by various postures guards the sexual centres from the undersides to the front of the male. The assumption of a waist-cloth does not actually serve the same purpose, but it constitutes a permanent psychical suggestion of inviolability. Similarly, the use of any appendage or covering involves the possibility of being cut, and by the addition of decoration, or, later, by the suggestion of mystery.

Further than this speciation as to origins need not be carried. The forms and functions of dress, and the customs connected with it, will supply examples of the material as well as of the psychological evolution of the subject.

2. Material and form.—It is proposed to describe the types of human dress and the materials of which it has been composed only so far as it is necessary to illustrate the religious and social significance of dress as an index to psychological evolution.

If dress be taken to include anything worn on the person other than offensive or defensive armor, there is hardly a single known substance, from iron to air, which has not for one reason or another been employed; while for the purposes of decoration or protection against the supernatural, the very utmost use has been made of the natural covering of the organism, in the way of hair, dress, and the like. Skins, skins painted, fur, feather, and fur ornaments and amulets on or in the projecting points of the body, particularly various orifices. In the earlier stages two features are prominent—the savage is apt to regard anything he wears as an ornament, though it may be actually a protection. Also, the less body-covering there is, the greater tendency to painting, scarification, and tatooing. Having, as Gaultier said, 'no clothes to embroider, they embroider themselves.' As examples of the earliest stages the following are typical:

The Niam-Niam negress wears a single leaf only, suspended by a string from the waist. 1 The Indians of Central Brazil wear a string round the lower abdomen. It is worn after puberty, but it conceals nothing, of course. The women wear a little strip of batist passing between the legs; in some tribes the turib, a triangular decorative piece of bark bast, is worn. 2 Except for waist-bands, forehead-bands, necklets, armlets, and a conventional public tassel, shell, or, in the case of the women, a small apron, the Central African native nakes. 3 The waist-string is made of human hair. The public tassal is a fan-shaped structure of fur-slings, about the size of a five shilling piece. Being carried at corsehole by women, it serves as a decoration rather than a covering. The Arunta and Ningitta women wear an apron. In the Western islands of Torres Straits the men are naked; the women wear a tuft of grass or split pandanus leaves; for dancing, a short petticoat of split pandanus leaves is worn in one example. The Samos the only necessary garment was for men and women an apron of leaves.

The New Ireland men 'go absolutely naked'; the women wear aprons of grass, suspended from cinctures made of beads strung on threads or left over. A belt of leaves is also worn by the women. 4 The Australians of the South show an advance on those of the Centre. The Enahlali white woman's gaunia is a waist-string of opossum-sinew, with strands of hair in front. The Central Australian woman has not even a string. The Enahlali man's wayxep is a belt, six inches wide, of sinews and hair, with four tufts. Opossum-skin rugs are worn in winter.

Among the Cureti of the Amazonas, the men wore a girdle of woolen thread, but the women were entirely naked. The neighbouring Guaporé Indians wear a variety of belts being not only naked and the women wearing a short petticoat. 5 In other tribes of the same region both sexes were quite nude. 6

The costume of the only ornamentalization prevalent with the Lower Congo men is principally confined to a grass loin-cloth, and at the same time the two in one case there was a small apron in front and behind, and ear decorations of wood and metal. The Garo petticoat was less than a foot in depth. To allow freedom of movement, it was fastened only at the upper corners. 11 The Wankonda men wear nothing

bark of a ring of grass wire round the abdomen. The women wear a single head-dress, exactly resembling that of the Kadira. The women at Upoio wear no clothes whatever. In the Shortland islands the women are obsequious and submissive in their manners and customs, the more moral and strict they are in the matter of dress. The fact should be noted, in leaving the subject of the scantiest form of dress, as being a regular concomitant of saktobee or  

Variations of the most opposite character in the same stage of culture are a frequent problem. In some cases they may be accounted for by foreign influence. But any accident may institute a fashion. Thus, the Upoio women are entirely nude, but among the Akikuyu the smallest girl wears an apron. In tropical countries the use of leaves as occasional or permanent garments is regular. Several peoples, such as the Egyptians in the Delta, or the Inca, were clothed throughout the practice into an art. Noticeable details are the single-leaf head-dress, and leaves fixed in arm-  

The Samoans wore girdles of ti-leaves (Cordyline terminalis), gathered when turning yellow. Adorned with flowers, their figured marks are a suitable example of the adhesion to island scenery. The Nias-Nam negroes wear a leaf tuck to a girdle. Fijian women are sometimes dressed in a leaf-girdle only. Goor women of New Guinea wear a girdle. The Javanese of Chota Nagpur are famous for their leaf-dresses. When dry and when wet they are changed for fresh leaves.8 The Semang of the Malay Peninsula wear girdles of leaves. On festive occasions, figureets of Lioealal leaf were used to hold flowers on the arms. Flower leaves were fastened in the girdle and the head- 

The Kayans use bark-cloth, which they dye red and yellow.80 The women of the Barai, the Malay Archipelago, and Polynesia, the girdle of bark-cloth is widely diffused. The Sakai hammer the bark of the oak tree (Anlaria sumatrana) and the wild bamboo (Arvorda) so as to expel the sap. It is then washed and dried. The loin-cloth made of this by the Semang is three, folded round the waist, and tucked up the front after passing between the legs. Both this and the women's fringe leaves are worn by the Malayan strong, which here has been introduced.17 The Woowilu Indians make their clothes, the tounce and the sleeping-sheet, from the bark of trees. The women beat this on a smooth log with a mallet shaped like a club and having grooves which give to the bark-cloth the texture and appearance of a mesh. The better sort of garments are made of stout cotton, of many colours and mixed with the down and feathers of birds.18 Wasten women wear bark-cloth fastened above the breasts and falling below the knees. Formerly the Yedua of Ceylon made bark-cloth from the riti (Anlaria sumatrana)  

The 'shirt-tree' of Brazil is a Lycistis. Its glistening bark is easily stripped. From a length of the trunk a cylinder of bark is taken, and beaten soft. Two arm-holes are cut, and it is ready for wear. This bark-cloth is worn for clothes in Western India. The men of the Abara of Assam wear loin-cloths of bark. Bark-cloth was worn by the ancient Hindoos.18  

Various circumstances, which need not be detailed, make certain peoples adopt leather or fur garments. Against cold and rain these are still unsurpassed. The men of the Akamba wore cloaks of ox-hide before the introduction of the European dress. The Malayan women wore leaf-girdles before cotton cloth was introduced.4 The only garment of a Chaco Indian woman is a skin petticoat, but in cold weather a mantle of skins is worn.5 The Ainu use bear-skins for clothing.6 Arctic and sub-Arctic peoples, like the Eskimo, have made fur-dress into a very perfect covering.  

Such ready-made articles of early dress contained both the suggestion and the material of manufactured cloth. The animal, insect, and vegetable worlds were gradually exploited for this purpose. Animals like the sheep and the llama, trees like the palm, have both supported man and inspired his invention. Thus from the Mauritia palm the natives of the Orinoco derived wood for building; from its leaf they have made mats, nets, and hammocks. Its sap supplied a fermented drink.7 Materials which have complex possibilities are more likely to encourage the inventive impulse of man than is sheep's wool, and cotton, ready-made after agriculture and building, to acquire economical importance.8 The hair of domesticated animals superseded skins; cotton and linen superseded leaves, grass-matting, and the rougher vegetable fibres, palm, aloe, hemp, and the like. With the introduction of an artificial dress-material the savage stage of the evolution comes to an end. But for various reasons many barbarian peoples draw at times upon the older natural fabrics. In some cases, like that of the Sakai leaf-girdle,8 it is regularly used in combination with woven material. The earliest stages of the barbarian period are illustrated by the following typical account of home-made fabric, dye, and dress. The dress of the Fulas is universally the cotton cloths made by themselves out of the plants grown in almost every village. It is cared for by an instrument, probably imported, which is very much like a wire brush about 8 inches by 9 inches, and woven on an ingeneous loom. The cotton is dyed blue with indigo, cultivated by the natives, and is marked by a white pattern produced by tying portions of the cloth together before dipping it.  

It is significant that in these stages the form of the material leads to actualization of its possibilities, and this is brought about by a combination of economy, concealment, and decoration. The third type of the perincal garment becomes regular: namely, for men, the loin and inter-crural cloth combined in one length, and for women a cartridge. For example, the ordinary garment of Fula women is a single cloth, either folded round and tucked in under the arms or wound round the waist, leaving the breast exposed.31 This type has been largely used by both sexes. In an extended form it is the sarong of the Malays. The loin-cloth of men is the muroo of the Polynesians. Both garments have the same method of fastening—a double or treble wrapping round the waist. From these folded developed the suspended or belted skirts of women and kilts of men. A combination of this principle with that of the shoulder-wrap leads to the tunic and robes generally. The toga-form of the outer robe is an echo, in this method of wrapping, of the earliest folded garment for the lower body. The loin-  

Dress,
cloth proper of the male sex has an extremely wide prevalence. As an example, the tunic of the Woodoo Indians, or palfoa of the Mosquitos, is a cloth, 24 inches wide, worn by men round the body, and from it is woven a skirt. All the way from the legs from back to front, the end hanging over centrally. It sometimes supersedes the male costume, 

With improvement in cloth and consequent increase in lightness and folding capacity, a modification was made by many peoples, namely, in the omission of the inter-crural method. Extensive use of this difference in appearance except for the greater volume of the newer fashion. The two styles are often confused under the term loin-cloth. The second is the loin of the Malays.

from the loin-cloth proper were developed drawers and trousers, a type of garment not seldom found among women instead of the petticoat. In all these instances they consist of a loincloth and a modifiable artificial skin, the earliest addition to the natural surface, the primitive waist-string, is still visible. As a girdle and belt it supports various forms of underclothing; by altering its width it supplies once more its original purpose as a pocket. Mantles, cloaks, and caps in the barbarian stages are confined to their particular purpose, protection against rain, wind, and sun. In the latest civilizations, the loincloth or kilt becomes regular for outside life, the barbarian cloak is duplicated into the coat and the overcoat; the cap into the hat and the umbrella. Of the tribes of Nyassaland it is reported that 'the amount of clothing worn varies very considerably, from nothing to European garments.' Such a case will serve to combine in one short view some of the contrasts of the various stages and some of the principles of dress.

The young children of the Yao and Agong run naked. Sometimes one has a strip of cloth suspended from the waist-string. A man wears a similar loin-cloth, and a woman an apron, eighteen inches deep. Both are suspended from the waist-string. The more prosperous men wear calico from the waist to the knee, wrapped round the body and held by a belt. Sometimes it is extended to fold across the chest. Women wear a cloth folded across the upper part of the chest. Often men and women have two cloths, one for the waist, the other for the chest. The Agong wear the latter toga-fashion, a fold being carried on the left shoulder. The loincloth is worn in many forms—blue, white, and another colour. European calico is now used; formerly bark-cloth and skins. Men now wear a turban, introduced by Arabs. In the house a woman still wears only a head apron.

In spite of the underlying similarity of principles universally found, dress more than any external feature distinguishes race from race and tribe from tribe. While distinguishing a social unit it emphasizes its internal solidarity. In this latter sphere there is again, room for individual and communal costume. Some types of racial and communal costume may be sketched.

DRESS

Dress in the classical account of ancient Greek, and Varro of ancient Italian dress. It is significant, sociologically, that the classic type, characterized by the loose tunic and toga, which with some differences was adopted by the great Oriental races, and is adopted both to the Oriental ideal of repose and to the classic ideal of aristocratic contemplation, was discarded, as the Empire developed into the States of Europe, in favour of what the Greeks called barbarian dress, chiefly characterized by tournai—a dress adapted to activity. Trousers, the Sanskrit chalana, had been connected in India, as now in the East Indian Archipelago, with the dress of warriors and chiefs.

The early Hebrews, like the Egyptians, wore the loin-cloth, originally, according to monuments of the latter, of the loincloth form. Drawers developing from this were first used as a priestly garment. Together with all Semitic peoples and the barbarians of Europe, they differed from Greek peoples in this one garment, though becoming assimilated in the course of time. The loincloth was a shirt. Generally it was of the Greek type, and formed indoor dress. Overlapping by means of the girdle, it provided a pocket; it was slit at each side for ease in walking. It had two types, the long coat, corresponding to the ladanov, and the full-dress cloak, the meth, worn by worthy persons and the priests. Both deserted the toga type with increasing alacrity. It was similar, generally, to the Chinese and Muhammadan long coat. The early Christians wore the ordinary dress of the country. They always evinced a strong feeling against luxury, display, and immodesty in dress. They determined not unlike to their revolt against Imperial paganism and its luxury and vice, but to their own class-feeling and class-prejudice, an impulse of the pride in lower class conditions of simplicity and poverty. This impulse is paralleled in modern labour and socialist psychology, where the workman’s garb becomes a fetish of caste.

Early Christian literature contains stories of Christians being tortured for refusing to put on garments indicative of idleness. All colour was avoided in dress, except the ‘natural’ colours of the cloth. Under the Frankish Emperors a prohibition was enacted against the wearing of a combination of coloured garments. Such a garment gradually gave way, and the dress of the country, monotonous and more of the ‘barbarian’ type, even in the South, was still worn by Christian Europeans without any limitations, country and class being now identical. Among details to be noted are the following:

In Germany and Europe generally, till the 16th and 17th centuries, night garments were not worn; every one slept nude. Sixty years ago in England the use of drawers was almost unknown, and was regarded as immodest and unfeminine. The tight-fitting hose were the man’s characteristic garment. The doublet or jacket was replaced among the academic class by the long coat. An extraordinary variety of fashions prevailed from the Middle Ages onwards. Knee-breeches later replaced the long-robe, and the longer jacket the doublet. The peasant’s overcoat or his linseed gown went back to early European times. Finally, the modern trousers superseded the knee-breeches.

The evolution of material includes some abnormities in taste of the inst. Some extreme cases may be selected to illustrate the same. Among the

Central Australians, human hair is used for various purposes, especially for the manufacture of girdles. The giving and receiving of it constitute an important right and duty. A married man’s chief supply is obtained from his mother-in-law. The medieval use of the hair-shirt as a mode of penance depended on the preservation of the fabric for the mortification of the flesh. Similar is the use of hempen fabric, sack-cloth, in mourning. In footgear an analogy is seen in the use of dried peas to make walking painful. The famous feather-fabric of the Nahuas nations, who lived in a paradise of gorgeously coloured birds, was made by skilled artists, termed amantecas. This feather-fab, with its brilliantly hued and stimulating patterns was used for mantles and dresses by the nobles and the wealthy, as well as for tapestry and similar drapery. The most skilled nation was the Toltec.

The interweaving of precious metal with dress-fabric is a luxurious custom, often merging in superstition. Thus Hindus and Chinese consider it lucky to wear gold, however minute the quantity, in some form on the person.

Colour in dress involves many problems of aesthetic, psychological, and biological importance. Behind fashion in colour there seems generally to be a principle of unconscious adaptation to environment. In warm regions, originally unconscious, were superimposed upon this. The varied symbolism of colour in dress has a psychological foundation. Towards the tropics the tendency to gaudiness becomes marked; subdued tones are preferred by inhabitants of the temperate zone. Conversely, there is adaptation to racial and individual skin-colour.

The Enahlayi Australians think red to be a ‘devil’s colour’, and thus have an unconscious appreciation of the powerful stimulus of red. Its erotic connexion no doubt explains its frequent use in marriage ceremonies. A natural association of ideas connects white with the purity of virgins and priests. The following are typical cases of doubtful origin:

Eline was a sacred colour among the Mayas; the priests and the sacred books were clothed in blue. At a certain feast, all instruments used in all occupations, and all children, were painted blue. The Yezidis have blue. Their strongest one is ‘May you die in blue garments!’ In the following example a tabo against mixtures may be involved. According to the Aharvades a combination of blue and red is a sign of sacrilege. Blue and red, however, were worn in the Hebrew high priest’s ephod, with the sash employed to separate the sacred from the secular.

The special colours of Hindus and Buddhists in Northern India are red and saffron. The Hindu abominates indigo. The Sikh wears blue or white and abominates saffron. The Sikhs wear indigo, or, if a descendant of the Prophet, green; never red. Tradition and caste, and race-feeling perpetuate such preferences when once established.

Superstitious reasons for wearing a particular colour are probably always secondary, as, for instance, in the following cases from India:

For six days before marrying the Indian Muslim bride wears old tattered yellow clothes, to drive away evil spirits. A wife mourning her husband after a long absence is dressed in yellow. Most Hindus of the West explain the custom of rubbing the body with turmeric in the same way. Among most high-class Hindus the bride’s clothes are golden; and, so is her hair. The Siwaikis wears yellow clothes. The Lamas of Tibet wear yellow, and yellow is the colour of Buddhism priestly dress generally.

A constant tendency may be observed for the colour, as well as for the form, of the dress of the sacred world to be the precise opposite of that of the profane. In later stages, asceticism is also in
DRESS

volved, and simplicity of form is combined with absence of colour in the ordinary priestly garb.

The purple of the Greek world, as worn by the great, and particularly by royal persons, is an expression of super-personality, as distinguished from sub-personal or the contradictory. Royalty among most races wears special colours as well as special dress. For example, the Malay rajas have a monopoly of saffron, for the Malay royal colour is yellow. White is regarded as 'more exalted and sacred'; it is used to conciliate spirits. It is believed at the same time that the blood of kings is white.1 As absence of colour, or the 'natural' colour of a fabric, implies negation or contraction of personality, so 'splendor' as in the various shades of crimson used by the ancient world under the one term of 'purple'—implies expansion of personality, and is suitable for festive occasions, both sacred and profane.

The negation of splendour is often expressed by black or dark blue. Superstition, when using these, relies upon their minimum of attraction rather than upon any optical adaptation. According to the Parsis, it is to be assimilated to the evil eye.2 The Gujarát Musalman believes that black or indigo clothes keep spirits away.3 In Roman Catholicism, as elsewhere, blue or violet is a colour symbolic of death. Blue is also connected with the external attributes of the Virgin Mary, possibly as mourning her dead Son. Such facts show a sentimental adaptation to circumstances. Red and yellow, being connected with organic growth, are the colours of well-being, and of the affirmation of energy and expended personality; the blue end of the spectrum represents the negation of these, in proportion to its deterioration in influence of the organic world. Where mythology and popular superstition has coloured theology, adaptations in priestly and other garb may occur: blue may represent the sky; yellow the sun; silver the moon; red the sacrificial blood, and so on. In social life, colour no less than dress or uniform becomes a distinguishing mark, either by accident or by design. The gild, the club, the social state (as in the case of the blue blousc and similar status-garbs), even the seasons of a Church, are represented by colour.

The following adaptations to sacred circumstances have much the same meaning as the injunction to wear 'decent apparel' on solemn occasions among the various tribes affecting the Malay miners in Malaysia is one forbidding the wearing of black coats, except for the payung, engineer-in-chief.4 Local incidents have much to do with the fixing of rules. In the archery it is possible that a sympathetic harmony with the white colour of the sacred metal is alone intended. In the next case, purity alone may be intended. The Druid wore a white robe when cutting the mistletoe. For a similar function the Cambodian priest wears white.5

The following is an excellent example of the principle of adaptation. The state to which the person is to be assimilated, with no doubt, the succeeding state of cessation of the blood-flow, white being used by way of contrast with red.

A ceremonial system, termed bereusong, is followed by some Dayaks in the case of girls at puberty. The girl is washed, and dressed in white. Then she is incarcerated for a year. During this period she eats only white food; the bunch in which she lies is white wood; at the end she is white herself. A feast is given to celebrate her release; at this she sucks the blood of a young man through a hamon.6

Green has been used to represent sympathy with the growth of green things upon the earth, as in many agricultural rites and spring ceremonies. As a contrast there is the Black Demon; this is 'plainly a mythical expression for the bare wintry earth stripped of its mantle of green.7 The use of green is also known to express the non-festal seasons of a religious year. Occasionally green figures as expressive of corruption. The association of green with certain forms of organic decay may have an added implication of modesty, the instinct to protect, though not necessarily to conceal, the sexual centres.

Most natives in India never wear shoes. Even the rich dispense at least with stockings. Leather is avoided on the external attributes of man. The impulse towards physical cleanliness finds particular expression in foot-gear. It is not so obvious in the case of dress covering the passive areas of the body. The religious rule of removing the shoes before entering a sacred place is identical with that observed in social custom, and the original motive is no doubt merely to avoid carrying dirt or dust into the house either of God or of man.

Head-dress and coiffure involve ideas of ornament and distinction in a more marked degree than any other forms of dress. In so far as these illustrate the principles of dress generally, they are here in point. The Kombs wear a head-dress in order to please the tso, the soul which resides in the head.8 The Javanese wear nothing on the head, which is regarded as holy.9 A Zambesi rain-maker never cuts his hair, for fear the familiar spirits may desert him.10 Fashions and superstitions are equally innumerable in the matter of coiffure. No part of the external surface of the body has been more variously manipulated than the hair. The coiffure denotes differences of race, tribe, clan, sex, age, and social status.

Flowers in the hair are worn by Dayak women; the hair is in a knot at the back of the head. Among Dayak men it is a common practice to grow the back hair and to part share the forelock.2 The Kayans of Horneo shave all the scalp except a large tuft of long hair which hangs down the back. How considers this to be a 'last remnant of the Chinse pigtail?3 The latter and the Americas use various of the ceremonial tuft are of the contrary in many tribes. The hair is either fixed by concentration or neglected by central indication. Similar principles have been applied in the varying fashion of wearing the beard.

Where the hair is emphasized as a human, or as a masculine or feminine, character, its aesthetic appeal is parallel to that of dress, which also emphasizes by various harmonies of colour and form the aesthetic value of the body. Particularly in woman long hair is regarded as beautiful, as her glory (cf. 1 Co 11). From savagery up to modern civilization this attribute has been emphasized by addition, made both by decoration and by culture.

False hair is regularly worn by the Veddas, who never brush, or oil, or wash their heads.2 The latter fashion, though nearer to the animal, may

be an expression of personal pride in the organism, not in society, since there is no puritanical desacralization.

The use of the fillet has two purposes—to confine the hair, and to prevent sweat from reaching the eyes. The protection of the eyes and the spine of the neck from the deleterious rays of the sun has been stressed in very early times. The general tendency is towards ornament in female, protection in male, head-gear.

Korean head-gear is remarkable. The men’s hats are lined with the breast warp with broad, straight, fringes, similar to the Welsh tall. The brims measure two feet across. The hats are as wide as a man’s head, and they are stained black, except in half-mourning, when they are string-colour. The court officials wear hats so fantastic that it is perfectly impossible to describe them. The women wear no head-gear, except for caps in winter. Such hats as the Korean and the modern European tall hat are the expression of ideas of the dignity of the head, just as was the crown.

4. Ornaments and amulets.—Though dress of the simplest description has an ornamental value, there has always been a precise distinction between dress and ornament. There is little possibility of confusion between them, whether the ornament is directly applied to the body or is actually an addition to the dress. We want to denote this rather than the wearer. Ornament is often de rigueur. No Hindu woman ‘would dare to hold up her head unless well provided with eight kinds of ornaments—pellets, necklaces, armlets, diadems, bracelets, anklets, and jangles.’ Lower races are fond of the necklace-method, using shells, seeds, and beads threaded on string. The women of Giana load themselves with seeds and beads in great rosettes. Almost as prevalent is the use of metal cinctures, which subsequently acquire the value of protective ornament or amulets. Originally they seem to have been an extension of the signature-principle.

Amulets are practically innumerable in their variety. They may be worn on the body or on the dress, and are usually abonormal in material. Dress itself may acquire the virtue of an amulet. The Malays write charms on paper or cloth, and wear them next the skin. The Mussulman and Hebrew amulets of sacred texts are familiar examples. The principle employed is that of assimilation of the sacred force by contact. The people of Surinam wear the ‘strong metal,’ iron, on their bodies, to acquire its strength. In armour dress reaches the climax of its protective functions.

5. Dress as currency.—In the absence of coinage, commodities are often exchanged in the form of mutual gifts, especially in the case of transactions which are more or less purely financial. At such stages any article representing work and intrinsic value is a suitable thing to wear or to present or exchange. In savagery, gifts of clothing are less frequent than gifts of food; in barbarism they are more frequent. The Trojans placed a robe on the knees of the goddess to induce her to save their city. In the East Indian Islands clothes are a frequent offering to the spirits. Blankets were a common gift among the N. American Indians. To show appreciation of an actor’s playing, the Japanese used to throw their clothes on the stage. At the end they were purchased by the donors, and the actor took the money. Blankets form the chief property of the Kwakuitl and Haida. They are treated as money, and may be used as a means of payment. The total value of the Nahuas was in the form of clothes and made-up clothes. The pelts involved in the payment of the tribute was one of the main aspects of the Nahua, ‘Rule of Life,’ which gave the people their name. Also a considerable amount of dress was annually exchanged in the Yukon by the people of the Indians of British Columbia, known as the Todtman, is a distri-

6. Dress symbolism.—Dress acquires ideal valuations from its various uses, materials, and associations. All languages are full of metaphors recording such ideas. According to the Sotopathy Brâhmanâ, ‘the priests’ fees consist of one hundred garlands, for that—to wit, the garment—is man’s outward appearance, whence people, who are not good sons, ask, “What can this be?”; for he is perfect in his outward appearance; with outward appearance he thus endows him.” This example well illustrates the idea that dress is both an expression and an extension of personality, in its superficial aspect.

The symbolism of the virgin zone, the girdle, the royal robe and crown, needs no illustration. In rare cases, an article of value used in exchange acquires the virtue of such objects as regalia and the Australian churinga. The cemupum of the North American Indians

event waves into them. The Iroquois supported the office of head-man-keeper, who was also or less a depositary of the history of the people. Every year the whole collection was exhibited and explained to the whole tribe. 1

The eagle-plumes of American warriors’ head-dress signified by their numbers and particular marks the achievements of the wearer. Similar marks of honour were made on their garments. 2 It is, however, misleading to characterize such phenomena as dress-language. Out of the extensive list of metaphors from dress only one or two types can be included in illustrations. The Acadian proverb saying of 16th cent. knight-hood contained the phrase, ‘Mon harnois me maison.’ 3 Besides implying the homelessness of the knight-errant, this also involves the application of dress and armour as external shelter no less than as bodily covering. The most prevalent metaphor in all languages, that of dress as a covering, often loses its force as a species of covering, and comes to be a synonym for the garment, owing to its constant use. In proverbs, the wisdom of nations and the wit of orators employs the simplest and the most complex ideas of dress.

In Malagasy the Shabihi proverb is used, ‘to cut out the tongue of the body, is the same as to cut off the English counting your chickens before they are hatched.’ 4 A famous Chinese book of moral instruction says: ‘Brothers are like hands and feet; a wife like skin and clothes. When clothes are worn out, we can substitute those that are new;’ 5

The metaphorical wealth of Indian literature is enormous. In the first place, dress is more than covering; it imparts an anthropomorphie value to the object. According to the Vedic texts on ‘Soma,’ the mixture of soma with milk, sour milk, and barley is a ‘garment.’ 6 Water, say the Upanishads, is ‘the dress of breath.’ 7 In the second place, there is no doubt that a good deal of mythological creation is due to metaphor, not as a disease of language, but as a deliberate use of association of ideas for the purpose of artistic and religious invention. Metaphors, like those of dress, serve, first, to personalize an object, and then to humanize it. There need be no confusion between the two uses; they are simply two methods of viewing one thing. Nor need there be any fetishism behind such cases.

On the other hand, the OT and NT use is purely abstract and literary. But there is no ground for supposing that this is a secondary stage, and that such metaphors were originally material identifications. The lowest savages, for instance, use metaphors merely as such. The pastures ‘clothed with locusts’; the heavens ‘clothed with blackness’; aucher ‘clothed with the sunshine’; ‘clothed with cursing,’ ‘with vengeance,’ ‘with drowsiness,’ ‘with strength and honour’; and flowers clothing ‘the grass of the field’—these are examples of biblical metaphor. Dress-metaphors may be morally applied. Clothed ‘with salvation,’ ‘with righteousness,’ or ‘with humility’ 8 is a pure metaphor. In Zorostrian texts it is said that the garments of the soul in the life to come are made from these parts and that person, 9

A beautiful metaphor like this is not degraded if it becomes concrete; it is merely translated into materiality. The great bifurcation of dress is sexual. Besides the personal symbol and metaphor which this involves (as in phrases like ‘petticoat government’ and ‘wearing the trousers’), there may be mentioned an attempt on the part of asceticism to

express the non-sexual idea. The attempt is made both in the idea of a ‘garment’ and of ‘garb.’ The garment selected is the long tunic, which survived here for other reasons, and the colour is white. Thus all indication of primary sexual characters is veiled; the dress not only covers but replaces the body. White is at once pure, but free from ‘mixture,’ as a mixture of all colours, and neutral, between splendour and shame.

It has been suggested 10 that the Egyptian cruz canasta, the symbol of life, is a picture of the kerchief. In the Hervey Islands a frequent name for a god is tatua manawa, ‘loan-belt.’ 11 A similar notion is that of the girdle, symbol of eternity, as the circle is of infinity.

The relation of soul and body is often expressed in terms of dress. The expression may be merely metaphorical; it may also be real. The body is not only a house or a tomb, as in some early Christian literature; more aptly is it an exactly fitting duplicate, covering the soul. Thus, the body, according to Malay psychology, is the sarong of the soul. Conversely, the destines spoke of the soul as a ‘garment.’ 12 In the one case the inner soul is a house, in the other case the body as a ‘garment.’

The metaphor that mortality might be swallowed up of life, 13 at the same time the body terrestrial is a ‘house,’ a ‘tabernacle.’ 14 The Déne Indian when sick regains his soul by the following method. His moccasins are studied with down and hung up. If the down is warm next morning the soul has entered the shoes, and it may be reunited with the body if the patient puts them on. 15 Here the presence of personal warmth, associated with actual wearing, represents the presence of the soul in the dress.

The metaphorical and symbolical applications of the idea of dress thus show an oscillation between very distant extremes, which may be summarized as on the one hand a sheltering house, and on the other hand an almost organic skin.

7. The social psychology of dress.—(1) The dress of magical dances. One of the free play of the social mind on the subject of dress in magical, religious, and moral opinion and ritual may be introduced by some such observation as that early folklorists regards weaving as a ‘religion of the loom.’ In other words, the operation has significance, attains attention, and may inspire wonder. But the ultimate reason is merely that it is outside the normal plane of ordinary human or, more exactly, animal activity. It is not because there is any reference either to dress or to magic.

The invention of fairy tales illustrates, by extravagant emphasis, various ideas connected with dress, but overlaid with that secondary form of magical belief which is merely aesthetic, literary, or generally fanciful. Stories of magical dresses 7 are numerous. The motif illustrates either the connexion of dress with personality or the use of dress as a protection, disguise, or honour. There is, for instance, the shirt of snowy whiteness which turns black when the owner dies. 8 The emphasis on sympathetic connexion is constant. The shirt which never needs mending while the

DRESS

wearer remains faithful is a contrast to the shirt of Nesa.

In German folklore a shirt spun and stitched by a maiden who has kept silence for seven years can undo spells and render the spell-proof. 2 St. Theresa was presented by the Virgin with an invisible cope which guarded her from sin. The clothing and garments which make invisible were familiar subjects of mediæval lore.

Malay folklore tells of the cloth, sasmatō kálī, "which which was of one cloth with each person and when that cloth should be finished the world will be no more."

An old Irish man has a robe, the sóthrub, which is miraculously made without letting in pieces; also a waistband of flowered cloth, which is a sky-blue colour in the morning, but as soon as the mid-day sun shines, the colour changes to red. 2

Among the Tonga and in the Society Islands the deceased are buried in the form of clothes. The soul is summoned, and then "the sacred cloth makes the sacred soul" takes place. In the case, for instance, of an empress in ancient times, her soul was to be evoked "with the aid of her sacrificial robe; then this robe must be thrown over the corpse in the same size, and the body must be covered to the sacrificial hall... be covered with a corpse-pall, and finally the robe must be thrown over the body and the soul of a dead man cannot attend the funeral, he is represented by a suit of sacks clothing carried on a tray in the procession."

At a Celtic festival, a woman's and a man's dress represent deceased ancestors. 2 Among the Eskimos the first child born after a death "represents the dead man. Those nameakes eat and drink the provisions and wear the clothes offered to the dead at feasts, on their behalf. At the end the shades are sent back wearing the spiritual essence of the clothes, while the gross substance is kept by the nameakes."

When the office of high priest in Tonga was vacant, the priestly dress was placed on a chosen male and yams were offered to it. It was regarded as an equivalent for the person. 2 If a Zulu lighting-doctor is unable to attend a patient, he sends his "soul" to place in front of the patient's door, as an equivalent for himself. 2

Bathing in clothes is a form of ceremonial purification. 2 The Druids showed the rotation of dress and person. If dress is a part of personality, it follows that it must share in the duties imposed on the natural body. Similarly, if the soul of a dead person is a replica of his ordinary personality in life, the soul after the death of the body is regarded as wearing clothes. This was, for instance, the case with the Egyptian An

The anointing of garments is a practice found in fashion, ritual, and ordinary life (see art. ANOINTING). As a detail of full dress, the wedding garments of the Masai bride are oiled before being put on. The robes of the Hebrew high priest were anointed with oil. When that person was anointed with the anointed oil, the hygienic purpose of oiling the skin is also fulfilled by oiling the garments worn.

In many cases the dress is not merely a repre-

sentative symbol of the person, but a usable substitute for a dress or less sacred and therefore unusable reality. A Masai man swears to the truth of a statement by his sister's garment, a woman by her father's garment. 2 The converse of this idea may be seen when rare and costly robes are made for the person of the monarch. These associations, in connexion with the innate love of finery, are concerned in certain observances during sickness and at death.

In serious illnesses, when the patients are spread round him in order to tempt the absent soul to return, a similar practice is found in northern India. The less bier of the Mourners Todas. 2 

In China "a coat belonging to the sick man, and very recently worn, is suspended on a bamboo." Incantations are performed to induce the errant soul to enter the coat. When the poles turn round in the hands of the holder, the soul has arrived, and is ready to take up its "favourite costume." For the Chinese ceremony of "calling back the dead," the dead man's favourite costume is employed. The idea is to entice the soul into it, for it should be induced to slip into such of its garments as it had been proud to wear during life. The dress is held out by a mourner, crying "He come back!" Then the soul being supposed to have entered, it is placed on the body of the dead man. 2 The Mongols try to persuade the soul of a sick man to return by putting out his best clothes, washed and perfumed. 2 The Maoris enticed the soul of a dead chief by the half of a piece of its old clothes. 2 The Inuit of the "Wash Taps" make horsehair hats, which are commonly made into a coat or caught in the same receptacle. 2

The customary method of dressing the dead in his best clothes may often be based on similar associations (see below).

The principle of impersonation is easily applied to dress. Particular cases are association to totemic or other animals, and may be regarded as a fusion of personalities, or rather the assumption of a secondary personality.

The natives of the Upper Congo between their faces with oil and charcoal in resemblance of a species of monkey; they explain that by so doing they derive "monkey cunning." Bechuana warriors paint their hair of a horrible colour and paint the skin of a frog on their cloaks, that they may be as hard to hold as are their hind legs. 2 The Inuit and the Dead dead must regard themselves as being identical with red-plumaged birds. They decorate themselves with their feathers. 2 All African tribes, says Schweinfurth (but a statement need not be indulged in interpretation), imitate in their attire some animal, especially those for which they have "reverence." In this way it frequently happens that their superstition indirectly influences the habits of their daily life, and that their animal-worship finds expression in their dress. 2 Among the Yavah of Chos, the bridegroom is dressed as a monkey when he goes to the house of the bride. 2

The purposes of impersonation are naturally manifold, and require general illustration. When a sick Eskimo child is made to wear a dog's harness, and is consecrated as a dog to the goddess Sedna, 2 the idea is, no doubt, change of condition as resulting from change of personality. On a similar principle, the Galápagos concluding that a barren tree is a male, turn it into a female by placing a woman's petticoat upon it. 2

Assimilation of dress to person has innumerable gradations, and passing ultimately into identity or duplication. The principle is complicated by the belief that inanimate objects have souls. There is an Irish belief that the clothes of a dead man wear out more quickly than those of a living man. 3

The Hindus hold that the dress and ornaments of the gods and deified mortals do not decay. 2 Garments, like other inanimate articles, have souls, as in Pijan and Tongan belief.

practices of sympathetic magic are abundantly illustrated by dress. A few typical cases may be cited.

Among the Torajas of Celebes, when the men are on campaign, those remaining behind may not put off their garments or head-dress, lest the warrior's armor may fall off. A moment, the presence of liku being frequently applied. A Malay woman explained that her reason for stripping the upper part of her body in front of an enemy was to make the Rice-bucks thinner. During the festival of the Mexican 'Long-haired mother,' the maize-goddess, whose dress is adorned with the head-dress of the I of I, and the long hair of the I, causes the rice to grow in equal profusion. In a Kashmir story, a weaver offers the king some black thread made of the black thread of the man wishing to his death. A rain-maker in Maluing paints his white dress black, with the explanation 'All along the sky. It rains as clouds, black behind, while it goes.' A woman's petticoat also is put on to signify clouds. In ancient India, the Brahman rain-maker went black with paint as a sign of black. He had to touch water thrice a day. Generally it is a rule that to make rain the operator must himself be wet, to make dry weather he must be dry. Who drives fat oxen should himself be fat.

Magical injury is effected upon a person by means of his dress, as having been in contact with or as representing him. The practice of injuring by personality, and, as such, its significance is en-fragments of his clothes or food, and the like, is world-wide. A rejected lover in Burma gets an image of the lady, containing one of his clothes, and his clothes. This is then passed or drowned. A Wotjebulak wizard would roast a man's opium-skin rug under a blazing sun, and then made him kill his horse or die. The women took to secluded in the water, when the skin felt better and recovered. The Tamul wizard prac-
ticed the same trick. He burned a crotchet with a cloth which he had obtained from the seaweed. Prussian folk has it that if you cannot catch a thief you may get hold of his garment, and throw him into his flight. If this is beaten soundly, the thief falls sick. The last case sug-
gests that the dress is regarded as a part of personality, or as an essential part of its activity. The practices illustrated above are perhaps better explained on this principle than on the hypothesis that things once in contact retain a magical continuity.

The converse method of enforced assimilation produces intimacy and identity by means of dress. To obtain a favour or to conciliate feeling, a Zulu gets a dress article or fragment from the person he has in mind, and wears it next his skin.

More numerous are cases of actual transmission of properties by means of dress. A South Slavon-
ian woman who desires a child puts a charme on a fruit tree. Next morning she places it on her own person. According to Swiss folklore, the dress of a dead child will kill any child who wears it. Such examples need not be multiplied, but their interpretation cannot be found merely in the idea of contagion of physical or magical properties. For early thought, it is an obvious inference that a man's nature.

inheres only in all parts of his body, but in his dress. Probably the interpretation of odour has led to this belief, if the breath is the only element in his invisible emanation which permeates a man's clothing and by which he may be traced, also a part of his other self. But inference from odour does not, any more than the idea of contagion, satisfy all the conditions. There is also, already suggested, to be taken into account the general ideas derived from the specific idea of dress. A garment is an expression of personality; and, as such, its significance is en-
forced by its application to other personalities, while this application receives a concrete meaning and the general idea is concretely realized from the mere fact that the object expressive of personality possesses and may reveal the material impress of the person. These ideas enter into many of the superstitions uses of dress. One or two types may be cited:

The Kayans believe that to touch a woman's clothes would entrain them and make them unsuccessful in hunting and war. The Siamese consider it unlucky to pass under women's clothes hung out in clotheslines, as it saps the vitality of the drinking, merely the application of organic activity and strength is intended.

It is doubtful if cases like the following imply as much as they seem to do. The desire to have an article clean and new is irreducible, but upon it may be developed habits and beliefs of a mystical sort. After buying clothes, scrub them carefully in order to rid them of all contagion of the original owners.

The irradiation of ideas of contact has remarkable power and extension by beliefs concerning the dress of members of the sacred world. Such garments are impregnated with the mana of the wearer, as was Elijah's mantle. But, as pointed out before, metaphors of mana are always be explained to reasons. The idea that 'sanctity,' for instance, may inhere in garments as an eluvium or a force is possibly a late explanation, and not the original reason for the practices and beliefs concerned.

The Mikado's clothes, by reason of their 'sanctity,' caused pain and swellings it worn by other persons. Similarly, to avoid injuring others, his using red vessels was destroyed, immediately after use.

The garments of a Maori chief would kill any man who wore them. In other words, the chief's self, inherent in them, had the power of destroying. In Fiji there was a special disease, kasu lama, caused by wearing the clothes of a chief.

The principles of ceremonial purity and deline-
ment have produced some remarkable forms of dress and rules of toilette.

Among the Mekeo of New Guinea, a woman after childbirth makes a dress made of coco-nut fibre when pouring water. The Tisné or Dée girl during her first period wears a skin bonnet with fringes reaching to the breast, because the sight of her is dangerous to society.

(4) Personality and state.—For the psychology of dress a class of facts relating to murderers and menstruous women, and illustrated by the Eskimo theory of the ha has an important significance. It is a frequent rule that persons who have shed blood, or emit blood, shall indicate their state in a peculiar way. Thus, the homicide among the Northern Indians of America and the painted mouth of a chief is probably not protective, but merely an uncon-
scious impulse to adapt the person to the particular state. The idea of protection may be superposed upon this. The Omaha murderer was not allowed to let his robe fly open; it was to pulled close about his body, and kept tied at the neck, even in hot weather. Such cases, if their meaning is pro-
tective, are perhaps as well explained as reactions to a vague and indeterminate impulse to conceal-
ment rather than as direct attempts to evade the ghost of the murderer's victim.

The smearing of the blood-bedder with blood as a means of adaptation to the state of bloodshed is exactly parallel with any investiture with a sacred

DRESS

53

dress, as a means of adaptation to a sacred state. The frame of the picture.

The Eckkino theory of tabu brings this out. Both personality in general, and particular states of a given personality, form collaterals of the tabu symbol and its expression of the state. The Eckkino hold that a man who has transgressed tabu appears to animals to be of a dark colour or surrounded by a vapour; for example, they believe that the Tabu of the Bushmen becomes attached not only to the soul of the agent, but to the belongings of the agent which he has tabu'd; in fact, of everything with which he may establish contact. If a child is sick, the mother removes a black attachment from its soul, caused perhaps by the child having taken milk from the tabu'd cow. A dead man's clothes may not be worn, for a hunter wearing them would appear foolish and the souls would avoid him.

Behind all this is the instinct against incongruity, mal-adaptation. A hunter must not wear the dress of a dead man or of a mourner; equally a mourner must not wear the dress of a hunter. The passage from one state to the other, or the transgression of tabu, is not the primary notion. The spiritual garb, resulting from a particular state, not originally the result of any transgression; it is an automatic effect of the state, a psychological echo of the adaptation, assimilation, or identification of the individual with his particular condition.

Again, it is believed by the Greenlanders that, if a whale-father wears a dirty dress, or one contaminated by contact with a whale, he will despoil the world of its tabular grounds. In such cases it is probable that there is originally no notion of contamination or contagion at all; there is merely the incongruity between the tabulated and contaminating circumstances of the hunt—the quarry being approached respectfully and regardfully, and the undress slovenliness of dirty clothes or the ill-omened and tactless reference to death contained in any connexion with a dead whale.

The garment of a particular state must be discarded when that state is past. By this means and by bodily 'cleaning' transition to the new state or to the normal is effected.

The Hebr. high priest after offering the sin-offering had to wash himself and put off the garments he had worn. Similar the Greek worshipper after an expiration might not enter a city or his house until he had washed himself and his clothes. Such rules are of world-wide extension. The principle of contamination in its secondary and ordinary meaning cannot cover all the facts. The original meaning of 'mixture,' and conversely the original meaning of 'purity,' as an unmixed state, supply an adequate explanation, in the principle of a person, in action, material adaptation to state. In customs such as the following the original motive is obscure, but the secondary idea of removal of a dangerous effluvium is suggested.

Among the Berbers of South Morocco, persons who have been wrongly accused of a crime sometimes entirely undress themselves in the saifihouse, when going to swear. They believe that, if they do so, the saint will punish the accused; I conclude, observes Westermann, who reports the custom, 'that at the bottom of this belief there is a vague idea that the absence of all clothes will prevent the oath from clinging to themselves.' Secondary also is the principle that sacred appurtenances may only be used once; when emptied of their force, they must be destroyed. Nor can we regard as primary the principle that change or removal of dress is a rite of separation from the previous state. The important thing is not the moment of transition (and there is no evidence that any danger is attached to this), but the state itself. Passage from one state to another is marked frequently by change of apparel, but it is unnecessary to labour the point of transition. It is rather the principle of adaptation to state or circumstance has, as a corollary, the principle of change, which may be more or less emphasized. Thus, the Lapps strip themselves of the garments in which they have killed a bear, just as after any sacred ceremony the participator puts off their ceremonial appurtenances. The particular state is over and done with; therefore its exterior adaptation must likewise be removed. Ideas of removing the sacred and dangerous influence are probably secondary.

These considerations, in connexion with the principle that solemnity in dress must accompany solemnity of circumstance and function, may explain the following:

For the harvest festival the two officiating elders of the Negus wash carefully and put on new clothes. The Greeks put on clean clothes after their initiation; before offering the Shinto priests of Japan put on clean garments. It is a precept of Islam that the clothes and person of a worshipper shall be clean. A Muhammadan would remove any defiled garment before he commences his prayer, or otherwise abstain from praying altogether. In ancient Christian baptism the novice put off their garments, and clothed themselves in new white robes. At the consecration of a Catholic virgin the novice puts off her ordinary clothes, and puts on the habit and the veil; also the ring on the finger—the ceremony being actually a marriage of Christ. The putting away of this skin dress of the novice and the assumption of new clothes were part of the 'ordination' of the ancient Irishman.

Whether the new state is the extraordinary state of sacredness or the ordinary state of common life, adaptation to it equally involves change of assimilative costume, preceded by removal of that previously worn.

In order to assume the crest of the Lulen, the Bear, the Car. Indian took off all his clothes, and spent some days and nights in the wild state. He then joined the Bear dance, in which he was dressed as a bear. During initiation to secret societies in Congo States the candidate is dressed in British Central Africa, boys during initiation wear bark-cloth. At the conclusion new clothes are put on. Entrance to the various 'gates' is marked by a change of garments after initiation put on new calico. When their initiation ceremonies were over, Kadfs boys were chased to the river, where they washed off the white clay with which their bodies had been painted. Everything about them was burned. They were smeared with the ordinary unguent and were given new garments.

Frazer has suggested that the practices of depilation, and painting the body white or red, at puberty, are in view of the belief in re-birth. The Kikuyu, for instance, hold that a boy is born again at circumcision, and he pretends so to be. But this idea is at past foetal.

When her period is over, a woman puts on new clothes. This is the ordinance of the Shiyagat Ld-Shiyagat, of the Mosaic and Hindu law, and of the vast majority of savage and barbarian customary social codes.

Thus, the Kharwar woman after her period bathes and washes her clothes. The Thompson Indian girl has the special dress she wore during a period of conception to puberty in the womb, into society.

At the end of the kiri, the annual trading expedition, which partakes of the nature of a solemn pilgrimage, the Reeta of New Guineas bathes, anoints himself, and puts on a new shi-join-cloth. His wife, who has stayed at home, also bathes and puts on new garments.

A sort of mechanical link between purification by lustration and the assumption of new clothes is made by anointing. After childbirth the Kaffir mother is anointed ceremonially with the ordinary fat and red clay. This is equivalent to the remuneration of defunct apparel.

New clothes express a new state or condition.

There is an impulse to rhythmical change in human life, coinciding with later ideas of morality. The DRESS, a fashion festival which was to banish all evil, shook their clothes, crying 'Let the evils be gone!' In such cases the idea of newness, owing to the contrast between the old state and the new and to the impulsive belief in change, provides an allurement, tending to dominate over the principle of adaptation to the new state. In other words, the important thing is not the succeeding state but the rudeness of the old.

Thus, the style of new clothes, the look, new clothes and new utensils were provided by each person; the old clothes were thrown away. The Oneu Tenga National festival, which all were clad in new clothes. The Hindus wear new clothes at the festival of the new year, sarasvathisali.

The Chinese ceremony of the festival by the boy on which the clothes for marriage. A suit of white body-clothes of linen is made for both bride and groom. Brand-new they are, and are worn during the marriage-ceremonies, for on this occasion they themselves become brand-new people. The suits are then put away, only to be worn again in the tomb. In Korea, on the 14th day of the first month, any one entering upon 'a critical year of his life' dresses an effigy of straw in his own clothes and casts it away. Fate is believed to look upon the individual in his new clothes as another person.

Here the second principle of disguise intrudes.

The ideas of disguise by change of dress have been developed in many cases.

Thus, in the seventh month of pregnancy, a Cereanese woman is covered by a sheath of seven colours, a new ornament, and a symbol of the new is placed on this. Thus the husband slices in two with a sacrificial weapon, the body runs away. Women, dressed seven times in seven colours; the Bulgarian, to cure scrofula, will creep naked through an arch of boughs, and then hang his clothes on a tree, the faces of other garments. In Uganda a stick is made to jump over a stick, and let his bark-cloth fall off. The principi on the death and runs in the opposite direction.

Often it is enough to follow the principle of the fantastic as a strong contrast to the previous state which has suffered misfortune.

Thus, a sick woman is dressed in a fantastic gash, and her body is painted with streaks of red and white. She then stands in front of her hot blazing a sword. The last detail is a later stratum. The Mosquito Indians believe that the devil (Wadra) tries to seize the corpse. It is hurried to the place where 'have disguised themselves with paint.' A Sibarian shaman will paint his face red when about to accompany a soul to the spirit-land, expressly to disguise himself from devils. The Tongans, when at war, changed their costume before every battle by way of disguising themselves. Similarly, the king of Israel disguised himself at Banoth-Gilead.

Disguise may take the form of impersonation, and the other person as a thing.

The people of Mimahsa delude the evil spirit by placing on the sick man's bed a dummy dressed in his clothes. A Brazanian king will dress himself who dressed exactly like their royal master. 'So that the enemy may not distinguish him from his disguise.'

The protective value of dress is often expressed merely as that of a covering.

Thus, when the angel appeared to Muhammad, he hastened to dress the infant to cover me with cloth. Then God spoke to him: 'O boy, enwapped in thy mantle, arise and warn!' From this point the prophet commenced his composition of the Quran. A Hindu mother positing a haunted place draws her robe over her child. In old Bengal there was a prayer for the protection of children till they were dressed in clothes.

In its sexual and supernatural uses alike the veil protects both the face or head from sight and the eyes from seeing the forbidden or dangerous object. To see and to be seen are often interchangeable, and often combined as media of dangerous influences. In early Arabia hands men veiled their faces to preserve themselves from the evil eye. Here there is no doubt a combination of subjective and objective methods. The veil of women and the consequent modesty concerning the exposure of the face are a remarkable characteristic of Musalmân social life, and illustrate the secondary habits induced by dress. Ceremonies at the birth of a temporary nature is found in the case of both. The mother is in widowhood. The novice during initiation to the Kotikili of the Zaui wears a veil, and is supposed to see nothing. Similar practices attend initiation to many forms of the secret societies. The veil of the bride is more or less universal. A Musâliman woman takes the veil, just as does a nun. Momentary veiling occurs in the presence of death and in approaching a deity. Socrates and Julias Caesar veiling their faces at the moment of death typified the Greek and Italian national custom.

To interpret, as Van Gennep does, these latter cases as rites of passage, with the purpose of separating one's self from the profane world, is fanciful. The habit is more probably a motor reaction to the impulse for concealment before an object of fear. The veil of the bride is a ritual concession to, and a material accentuation of, the sexual character of modesty, rather than a rite of separation from the previous state. To apply the idea of separation from the previous state to the habit of veiling at the moment of death is clearly impossible. In the case of many secret societies we must rather intend merely to accentuate the sense of mystery.

In connexion with marriage there are customs of stripping or forcible removal of dress. In some cases these seem to point to a diminution of personality, in others they are preparatory to the assumption of a new dress, often presented by the bridegroom. Among the Roro tribes of New Guinea a nubile girl is tatted, and wears ornaments every day. After marriage, for a few weeks she decorates herself every afternoon. She may not visit her father's village until after a ceremony in which she is stripped of all her finery. The idea, no doubt, is to affirm her subjection to her father's family.

The exchange of presents of dress, a prevalent custom at marriage, may be extended.

Thus, the Kola of New Guinea hold the bead ceremony when a first-born child is three weeks old. The infant is decked with various finery, and is carried by the mother, also dressed up, to her mother's brother. A broken egg, a pot, a spear, a peticoat, and a firestick. After smoking and tooth-cleaning, the boy receives the child at the ceremony of the child's mother. In each case the ornaments and clothes from the mother and the child. These and the articles carried by the father become the property of the infant and the girl, the grandson and granddaughter on the maternal side. A return present is given.

Costumes which prescribe the wearing of best clothes or of rags illustrate the most important psychological result of the invention of dress. This is a secondary human character, the feeling for dress, and is one aspect (consisting in extension of self-consciousness) of the reaction to extension of personality. It is really distinct from the feeling for ornament and the impulse to protection, but is correlated with the more physical impulse to cleanliness, and the dermal and nervous refinement which dress has introduced into the human organism. Connected with the latter development are various reactions in the spheres of art and etiquette. Stanley Hall finds that 'of the three functions of clothes—protection, ornament, and Lotse's self-feeling—the second is by far the most conspicuous in childhood.' But the sense of personal dignity and physical pride is only latent in childhood. Of the psychical resultants of dress this adult character is the most significant. As Lotse ...
DRESS

55

put it, clothes extend the limits of self and enable the wearer to wear his own self to a greater extent, and the"glory of each garment. A precise analogy is found in the psychology of tools. Add the sexual factor, and add the more presence or possession of the article of clothing gives the wearer the sense of self-respect and personal dignity, of sexual desirability. Thus it is that one cloth is a person to be bribed him; this was so even in Homeric times, for we may recall the threat of Ulysses to strip Thetis.1

Similarly, to foul a person's garments is a secondarily direct insult. When the sense of well-being is thus interfered with, fun is an expression of it and an adaptation to it. Also, on momentous occasions a man of any period will dress very carefully, unconsciously intending to affirm and ennoble his personality, in an expression of it, the misery, the negation of well-being, or humility, a negative form of dress is employed; value, colour, and style are at a minimum. The diminution of the body and the wearer's identity is a reaction on the psychological state of the individual.

On these foundations luxury and superstition have erected a mass of fashions. Two typical cases follow.

Great personages in Siam used to wear clothes of a different color for each day of the week. As an example, white was worn on Monday, red on Tuesday, blue on Wednesday, red on Thursday, black on Friday, violet on Saturday.

The primary meaning of the dress next cited is not taisuanic, but a suggestion of well-being. Its magical content is secondary, and is there elaborated particularly. The Chinese silks 4, the garment for a long life, is a long gown of gauzy silk, blue or red or brown, with a lining of blue or black. It is essentially crossed over all with gold-thread characters, representing the word 'longevity.' It purports in the first place to prolong the life of the wearer, and therefore frequently wears it, especially on festivals occasions, in order to allow the influence of longevity, creative and indestructible, to work their full effect upon his person. On the anniversary of his birth he will scarcely ever neglect doing so, it being generally acknowledged among the Chinese that it is extremely useful and necessary then to absorb a good amount of vital energy, in order to attain health and healthy during the ensuing year. Friends and kinsmen who the house to take part in the festivities will then, as a rule, greatly admire the dress and tender their reverent congratulations to the happy wearer, whose children have been so full, and so blessed by fate as to have bestowed a present of such delicate and precious description. The longevity garment is generally the gift of children who are full enough to wish their parents to live long. There is considerable ceremony about this last gift: the garment should be as fine as possible in one year which has an intervalary month; such a year naturally has significance. In accordance with Chinese ideas about sympathy between ascendants and descendants, the garments also ensure longevity to the wearer's posterity.2

In war the male impulse is to emphasize personality, this is more powerful than the impulse to protection, though the two may be combined.

The Dayaks wore in war-dress a basket-work hat, kalong, and a jacket of skin or quilted cotton. The crown of the helmet is adorned with feathers of palm plumes. The jacket, or war jacket of silk, has the animal face on the wearer's stomach, and its back hanging over his shoulders. It is little defense, though the head is covered with a plate or shield to protect the pit of the stomach.4

The mere fact that in all periods social meetings are for the wearing of best clothes indicates the social significance of dress. Dress loses half its meaning except in relation to society. The principle of extension of personality refers to the individualistic aspect of dress; the principle of adaptation to state is its social side. The vaguely termed 'festival' of lower cultures is expressive of mutual well-wishing and of common well-being.3

At festivities the Aluns dress in their best clothes. The statement applies to all peoples. The individualistic form of the social meeting is amphitropic.

As is the rule with all peoples, the Guiana Indians, "when expecting guests, especially noble guests, they dress up with the finest dress and ornaments, these often, as in this case, consisting only of a narrow head-cloth by way of a necklace, a pair of earrings of white beads by way of ornament."1

A few types of festival dress may be cited from a variety which exceeds all other forms of human inventiveness and expression which display the human physical pride and his tendency to shift its focus to an artificial and variable substitute.

The Manipur festal head-dress is remarkable. A white turban is bound round the head, and the turban in front is wound round a shumalz, a horn-shaped construction of cane bound over with cloth or gold thread, and ending above in a loop and below in three flat loops which are concealed under the turban. The shumalz is over a foot high, and curves slightly backwards; from the loop at the end hangs an embroidered streamer. On each side of the head a plume made of peacock's feathers and the tail feathers of the hornbill are inserted in the turban. . . . The whole structure is bound together by a narrow band of red and white embroidery, wound round and round and tied, under the chin, with ends hanging down nearly to the waist.2

On high days Tangkul men wear a lift, and the lubop head-dress adorned with toe-man feathers and tresses of hair.3 The Wolwana Indians went on festal occasions crowned made of the curly head-feathers of the curassow, and on the arms, feathers of the mauvay, or yellow tail-feathers of the Ostrich monstrum.4 The women wear great masses of beads round the neck, sometimes shaping the whole space from the bosom to the chin. A petticoat of bark-cloth extends below the knees, which is wrapped round the loins, and the end is tucked in over the front. The exposed part is exposed for a deep vermillion, the colour being extracted from the pod of the arumto abubu.5

The Ackawal wear for festivals a dress made of the bright, greenish yellow, young leaves of the Acta palm (Mauritia flexuosa). The Surinamese women of all the tribes ornament their heads and necks with the black and white bands of red maple feathers, a ruff of black curassow and white egret feathers, and a strip of waist-cloth, as a dress for the feast. At the feast of the dead, Quorong men wear a 'glory.' This consists of bands of red maple and red thread, one and a half inches wide, round bound the head. In many parts of the country beads of bamboo with feathers inserted, the structure being eighteen inches in height itself.

The dance is a social language, a motor expression of individuality in society. As a rule, best clothes are worn. Various circumstances often impose different fashions for the dance, and the wearing of the Veddha puts on the hangula, a white cloth tied round the waist. Formerly leaf-girdles were used.6 Probably such costumes are merely for the facilitation of movement. Other care is paid to the dance as such. The female dancing dress of the Pulas is elaborate, made of velvet or ornamented cotton, sometimes decked with bells which sound in time to the music.7

Meetings of divinity in its most typical character are no less marked by fine clothes. The Qur'an says: 'Weary your godly apparel when you repair to my mosque.8 The injunction applies to all religions, and the literal interpreters, by the distinction between well-willing and well-being, and later to the distinction between worshippers and deity) that excess of luxury is forbidden or discouraged. Cleanliness of attire is regularly enjoined, originally, perhaps, for the avoidance of notoriety, material or supernatural, but of mixture of states. Just as all sacrifice should be precious, so should a dress-wearing be well-dressed. The human victim sacrificed by the Pawnees was dressed in the richest raiment.9 The meridhi of the Khonds was dressed in a new garment before the sacrifice, anointed, and adorned with flowers.10

For seapages the case may be different. When the image of the god is clothed it necessarily wears the richest raiment (see below).

The connexion of line dress with well-being, and the estimate of clothes as a necessity of life,12 are combined in the Hebrew belief that

Jahweh was the ultimate donor of food and raiment.1 The teaching of Christ against ‘taking thought’ for raiment, illustrated by the natural dress of the lilies of the field,2 was a wise protest against extravagance in the cult of this secondary deity.3 The old raiment was often put on, it appears, for religious purposes. The old man in the desert was clad in a ragged garment.4

Diminution of personality is symbolized by various customs of removing part of the dress. In India a low-caste man passing through a high-caste street must take off his shoes and turban.5 That the reason for such uncovering is not the assumption of an unprotected state, by removing a garment of defence, is shown by such a case as the following. A person who interviewed Montezuma put off his usual costume and appeared in plain coarse dresses and barefooted.6 The modern European fashion of removing the hat is a salutation of respect of a similar order, and not a removal of defence.

A permanent inferiority of person or status is expressed by the variety of dress.7 In Fries the sons even of rich families are dressed like slaves at public feasts, so long as the father lives, as also at his funeral.8 This is apparently the survival of a strict patera potestas, which remains in force till the funeral; until then the son is the father's slave.9 It is a very marked custom of the Shetland Islanders to show deference to the old. ‘They must never come into the presence of aged persons or pass by their dwelling without taking off their hat, and assuming a crouching gait.’10

An artificial assumption of humility may be employed to emphasize the succeeding magnificence, or to deprecate the ill-luck which may follow pride. For some days before marriage the bride and bridegroom among the Musalmans of the N.W. Provinces wear dirty clothes.11 Such practices may succeed in taking the ideas connected with disgrace and protection from the evil eye. Similar, though of more obscure origin, is the custom, found in old English coronation ceremonies, that the king shall appear in poor garments before he is invested with the royal robes. German peasants dress a child in mean clothes to protect it against the evil eye. In Egypt the children who are most beloved are the worst clad. A fine lady may often be seen in a magnificent dress, with a boy or girl, her own child, by her side, with its face smeared with dirt, and wearing clothes which look as if they had not been washed for many years. The custom of taking the ideas connected with disgrace from the evil eye. The method employed is not disgrace, but humiliation, negation of well-being, either deprecatory or to escape notice. This custom is, however, a very common and widespread practice.

Penance and asceticism often coincide in method. Sackcloth is in this connection the analogue of fasting and humiliation. For penance, it even prescribes clothes of cow-hair, with the wearer's own hair in its folds.8 Among the rules of penance in medieval Christendom was the wearing of dirty clothes. An ancient rule for Buddhist monks was that their dress should be made of rags taken from a dust-heap.11 Early Christian ascetics wore dirty clothes and crawled abroad ‘like animals covered only by their matted hair.’12 Hindu ascetics similarly passed the night in clay or mud, mortifications, until British law interposed to prevent the endurance of the nuisance.13

A curious question is raised by certain fashions of cleanliness in connexion with dress. Physical cleanliness is a habit which has undergone evol-

The ancient Huns and Mongols, as well as the modern Kaimukas, are reported to have washed the feet of the priests, thus removing possible contamination of the body itself, no less than of the higher claims of personality.

In the dress of the Togetic priori Neumann, to it is recorded that the “a

The case of the Australian native, who never takes off his girdle of hair, is rather different; the analogy here is the non-removal of such articles as rings. Thus, while her husband is alive, a Hindu woman dares to take off her ear-rings, which are part of the symbols of marriage.2

Ideas of ceremonial cleanliness have probably had an important collateral influence upon the evolution of habits of cleanliness. Some such ideas the avoidance of mixture of condition and environment may have contributed to the development of personal purity, whereas during the early stages of the evolution of dress there seems to be no a priori reason why clothes, as such, should be periodically cleaned. The case of the Sabaeans illustrates the connexion between cleanliness of dress and of person. The candidate for the priestly office is instructed not to dirty himself; and he must change his dress daily.2 Given the existence of a natural impulse to avoid the threatening of the evil eye, the foundation being similar to that of ceremonial purity—an unconscious preference for cleanliness and distinctness in objects, a preference for the thing itself in its essential, specific, and individual, or unmixed, purity of character—asceticism, when, as is often the case, encouraging uncleanness, is a biological perversion and a social danger. Early Christianity was largely tainted with this.10 St. Jerome approves the observance of Paul, that ‘the purity of the body and its garments means the impurity of the soul.’11

The ritual and emotional removal or tearing of dress is apparently attracting attention from all parts of the world. The Hebrew widow repudiating the levirate takes off her sandal and spits on the ground.12 In Van Gennep’s terminology this is a rite of separation from the husband’s family. Among the ancient Arabs, women were often mourning barefoot, their hair in the face and bosom, but also tore all their garments. The messenger who brought bad news tore off his clothes. A mother desiring to bring pressure to bear on her son took off her clothes.13

A man to whom vengeance was forbidden showed his despair and disapproval . . . by raising his garment and covering his head with it, as was done in fulfilling natural necessities.14 Among the Chuvashes, Cheremiss, and Wotyaks, the humble effect of divorce by tearing his wife’s veil.15

Similar customs, especially the rending of the garments to express indignation or repudiation, were prevalent among the Hebrews.16

10. I. P. Dorf, Choctaw, in P.A. 120, 1900.

Columbian, expresses indignation against a wrong by destroying a number of blankets, the native currency. His adversary is expected to destroy an equal number to satisfy honour and heal the quarrel.

The dressing of garments is perhaps a development from the reflex impulse to destruction generated by anger, indignation, or despair. When it becomes symbolic it may take on the character of a rite of separation, the dressing of the garment indicating farewell to the isolated corpse of the person from calamity or injury. In the Hebrew custom the latter seems to be the prevailing meaning of the rite—a meaning which might naturally be superposed upon an original unconscious reaction to emotions of resentment or sorrow. Stripping, as an indignity or penance, is applied to any person. Thus, when his guardian

\[ \text{(5) Dress of the dead.} \]

Like other states, death is marked and solemnized by a change of dress. In modern civilization, the corpse, whether embalmed or not, is either wrapped in strips of linen or cotton cloths, and covered with the gar-ments, if any, most typical of the dead person's official position. In particular cases, customs like that of the Chinese are observed. When this involves the idea that official dress is more than individual personality, a special covering representing specialized social functions, whereas lay garments represent general dress. Among earlier peoples it is the general rule to dress the dead person in his best clothes. Typical cases are the American Indians, Burmans, Tongkingese, Maoris, Greeks, and Chinese. Careful washing and scrutinizing of corpses are no less significant and prevalent parts of the more or less ceremonious investiture of the dead.

Among the Tah and Rwe peoples the dead body is washed, dressed in the richest clothes, and adorned. The Yorubas dress the corpse in the best raiment. The exposed parts of a woman's body are dyed red. The body is wrapped in clothes, but in grass mats. Among the Kols of New Guinea the dead man is washed, oiled, and painted; a new loin-cloth and ornaments are put on him. The Greenlanders undress a man when at the point of death, and put his best clothes upon him. This detail recurs in China. The Hindus wash, shave, and dress the dead body.

According to Homer, the corpse was covered with a soft clotlhe, and the head was swathed. The Greeks dead were shrouded in the handkerchief garments the family could afford; there was an idea of keeping them warm on the passage to the grave, the latter being, as a rule, a person's best favourite clothes. Five suits of garments are mentioned. The modern Greeks dress the dead in best clothes, but these are not used unless by being snipped with scissors or drenched with oil. The grave-clothes of a Chinese are arranged round his dying body, his feet and hands being bandaged and clothed. He rejoice, in his last moments of consciousness, 'that he will be fashionably attired in the regions beyond the grave.' It was the old custom to strip the man of his clothes just before expiring, so as to put the new clothes on, if possible, before death actually occurred. The Chinese ritual of dressing the dead is most elaborate. The curious point is that the corpse is swathed almost as thickly an Egyptian mummy, but in suits of clothes, not bands of cloth. A distinction is made between inner and outer garments, the former being specially prepared for wear in the grave, the latter being, as a rule, a person's best favourite clothes. Five suits of clothes are mentioned, because five is a synonym of ten. Nine and thirteen are usual numbers. Even numbers symbolise the Yin part of heaven and earth, femininity; they are forever avoided; and odd numbers typifying the opposition of the sexes are used. Confucius was buried in eleven suits and one court dress; on his head was a chapeau cap. But, in accordance with the ancient division of the dressing into three stages, the body-clothes, the 'hawb' dressing, and the outer eleven suits comprised the first stage only, and over them were the 'slighter' and the 'fuller' dressing. The clothes are exhibited to the bereaved before each suit is put on. The elaborate rules of the Li-kis about the dressing of the dead are followed. Previously the best or favourite suit is placed on the dying man before being placed on the corpse: the clothes are put on the chief mourner. He is stripped, and stands on a cloth resting on a chair, so as not to contaminate the floor. He wears a large round hat, so as not to pollute heaven. Then each garment is put upon him in its proper order, and afterwards taken off. In the funeral ceremony of a woman, the oldest son, as chief mourner, still has to put the clothes on. The Li-kis explain the custom by stating that the mourner is con testing a medicine before his father drinks it. As the dressing proceeds the mourners wall and 'howl.' Wide drawers, lined, for comfort, with silk, are first put on. Stockings and a jacket follow. An ordinary jacket of linen, cotton, or silk, and trousers of the same material come next. A second jacket or even a third—the more there are the more devotion is expressed—may be added. When the body-clothes have been put on, the cutous suit follows. The blue gown of the middle class is a common type. It overlaps to the right, and is buttoned at the side. Over this is a jacket with short sleeves, extending, that is, only to the finger-tips; it is the kind of jacket used in winter as an overcoat. A common skull-cap or long hair, or horse hair, complete the suit. The costly silk clothes used on festive occasions are preferred by the wealthy, who are wrapped in satin or brocade. An ascetic attire of the paterfamilias, as high priest of the family. These include an outer and inner cloak, neither having a collar, and a three-piece of the inner draped to form the form of a horse-shoe shape. The inner is dark blue; for summer it is worn, white or green. The outer dress is a long shirt worn round the waist. The boots are of silk. The winter suit alone is used for the dead, even in summer. Women wear their best embroidered clothes, such as a long embroidered mandarins' wives, which in the regular bridal costume. It includes a dragon, the sable of green silk, a dragon, a mantle of red silk, a mantilla of black silk, and boots of red silk. The bride's hood, or parasol hat, is a quarter-globe of thin tinfoil, covered with butterflies, leaves and flowers made of gilt, copper, and symbols of felicity, joy, wealth, and longevity. Great care is taken with the coffin.

Such is the the phos, attire of the dead. Women, as a rule, wear the 'longevity garment,' but men prefer the true sacrificial robe, the the phaks. Of these clothes the clothing laid out for old age, at about the age of 50 or 60. They are preferred but cut and sewn for a man, and put on him—there is a person being likely to live long, and part of her capacity to live must surely pass into the clothes, and thus put off for many years the moment when they shall be required for use. If these clothes have ever been lent to a friend, not of one's own clan, they may not be used for their own purpose. Another suit must be prepared. However it may happen, it is a curious fact that the grave-clothes are often cut carelessly, and merely pasted, not sewn. Quite poor people use cheap mats. It is probably Buddhist influence that forbids the use of weather. Nothing may not be cut or sewn for the corpse. This is supposed to injure the body during decomposition.

The Malays shroud the dead body in fine new surroundings, sometimes as many as thirty. The broadcloth of the mummy are a development for a particular purpose. The costumes have been prepared in advance of the life. In ancient Egypt the gods were invited to grant clothing to the dead. The bandaging of the mummy corresponds in its ritualism very far, for example, with the beards that prepare them, the clothing for the corpse. For instance, a sorrowing husband reproaching his wife for having placed the corpse in the mummy, the bandages for thy burial. I have given to be made for thee many clothes. The application of the swasthas 'a divine task.' In funeral rituals there are the characters 'of putting on the white bandages,' 'of putting on the green,' and of the light red and dark red bandages. The most frequently used was a 'measure of the affection of the relatives.'

As a type of simpler customs the following explains itself, and is significant for the whole theory of the subject.

The Samoyeds dress the corpse in the clothes he was wearing at death, and wrap the whole in birch bark or deer skins. Rare cases occur where derogatory garments are applied. The enthusiasm of horror of death and its semblance sufficiently explains the following rule.

Zoroastrian law ordained 'clothing which is useless; this is that in which they should carry a corpse.' In the case of still useful clothing which had been worn, the process of burning was a very thorough and minute process of cleaning was applied. 1

When preservatives are not applied to the grave-clothes, some peoples periodically renew them. The bodies of the Corpse-lecas were preserved and clothed, new clothes being supplied as required. At stated periods the Maoris open the coffins of their ancestors, removing the rotten funerals and rolling the bones in new ones.

The outer motif is to place changes of raiment in the grave, just as other articles of use are there deposited. In Vedic times, clothing and ornaments were placed with the dead for their use in the next life. The Chinese place clothes and silk in the grave, besides the numerous suits in which the dead is clothed. In China, clothing, according to Pahari texts, was to be put upon the sacred carks of the 'righteous guardian spirit'—both for its use in the other world.

The clothing and weapons deposited in the Kayan grave are of the highest value, no broken or damaged article being deemed worthy of a place. On the other hand, many people regard such articles useless by cutting or breaking them before deposition; and a principle commonly occurs that in this way, the souls of the articles are released (as is the soul from the broken body of the dead man), and are thus able to accompany him to the place of the departed.

There is naturally some doubt as to the condition of the soul in its super-terrestrial home. Thus the soul of the Mexican, at death, entered the new life naked, whereas the soul of the dead folded wore 'a beautiful mantle' when it departs towards the other world in the way of a sacrificial offering. The Chinese place clothes and silk in the grave, besides the numerous suits in which the dead is clothed. In China, clothing, according to Pahari texts, was to be put upon the sacred carks of the 'righteous guardian spirit'—both for its use in the other world.

The clothing and weapons deposited in the Kayan grave are of the highest value, no broken or damaged article being deemed worthy of a place. On the other hand, many people regard such articles useless by cutting or breaking them before deposition; and a principle commonly occurs that in this way, the souls of the articles are released (as is the soul from the broken body of the dead man), and are thus able to accompany him to the place of the departed.

As for the meaning behind these customs, there seems to be, as usual, a series of moral strata or psychological layers. Various emotions might be supposed to be in competition as soon as attention was called to their direction from a man just dead. Other things being equal, and before ideas of contagion on the one hand and of a future life on the other had been developed, principles of property and feelings of sorrow would first come into play, together with the principle of dress as an adaptation to state. Thus the Samoyed type may be one of the earliest. The corpse retained the garments he wore at death. He is prepared for the new state by the protective (both of external and of internal direction) covering of bark or similar substance, which takes the place of the coffin.

Sorrow and affection would make the stripping of the corpse an act impossible for relatives. As the various ideas relating to the state of the dead became clearer, regard would be had to the comfort of the dead. No less than the living they must have the two great necessities, food and raiment. Naive examples of the idea are numerously found in the practices of the ancient Christian church, which wrapped the corpse in a rag, for the purpose, expressed, of keeping the dead man dry and warm. Various penetrates have been known to put an umbrella and gloves in the coffin, as a protection against the rainy skies of the other world.

Later still there would supervene the idea, of complex origin, that articles in the house of death must be, like the occupant, broken and soulless. One component of this idea is perhaps as early as any, namely, the realization that articles of value, permanently deposited in a place by no means secure, and practically known to be unused, should be rendered useless, to avoid robbery and the attendant distressing results of exhumation.

The custom of dressing the dead in his richest raiment, and in many states, the problem becomes less simple. First of all, as soon as the social consciousness realizes that death is a social state, and therefore to be solemnized, a change of garb is necessary. What are significantly termed in various languages 'the last offices' express this principle, as well as the feelings of sorrow and affection, and the desire to do honour to the dead, as for the last time. In such conditions it is inevitable that the best of everything should be accorded to him. But another reason is perhaps involved in the complex psychoses, at least in the earlier stages. This is economic. In early culture, clothes are property. Just as a man's property is called in and realized at his death, so a similar process is universal in mankind. There is thus a still a number of society; and the most personal and most distinctive of his property fittingly remains with him—his personal attire. Equally fitting is it that this item should be of the best, as representing him in the last of his social functions. By a pathetic paradox he is arrayed in his best clothes, as if to assert his personality and to express it in its highest terms, for the last time, though actually that personality is no more.

It is not likely that the dressing in fine clothes to tempt the departing or absent soul to return has any reference in this connection. The custom of using many suits of clothes, or of scarfing the corpse, as an absurdity by the Chinese, is one of those problems that elude all rationalism. There is the analogy of the mummy-swathtings, which suggests that the suits may have been intended as protection; there is also an idea of placing on or with the corpse all his available assets. The custom of dressing the dead in their best clothes, as of placing food with them, has been explained by Frazier as originating in the custom of 'feeding the dead', a notion very common in all his available assets. The custom of dressing the dead in their best clothes, as of placing food with them, has been explained by Frazier as originating in the custom of 'feeding the dead', a notion very common in all

(6) Mourning dress.—The social significance of dress is well brought out in mourning customs, among which the widow’s headdress is the most prominent. The variations are innumerable, but the principles involved are fairly clear. A few types only can be mentioned here.

Among the Maidu, as mourning, the widows’ hair is cut short and, as mourning, the Andamanese smear themselves with clay; ancient and modern Egyptians ‘paint’ their skulls with the ash. Among the Chippewa, it is said that the men wear a black, red, white, and yellow beaded head covering when mourning.

The Widows of Boreno wear the black cloth round the capes they wear; in the Netherlands the knots of his hair, and bits of his tools, as a necklace. She is painted black, and wears a petticoat reaching to the ankles.

Over the upper body she has two netted vests, the outer ornamented with seeds and feathers. A network cap is on her head. This costume is worn for six months, after which she is relieved of her mourning by the roba momento ceremony, and the petticoat is burnt. The widow is also painted black all over. Among the Maidu, the neighboring people of New Guinea, houses of the dead are worn by the mourners. A dead man’s jaw is often worn as a necklace.

The principle of adaptation in colour is well exemplified. The most frequent colours used are black, white, dark blue, and the natural colours of, as a rule, cheap and common fabrics.

The mourning colour in Korea is that of raw hemp or string. For a year the women wear the well-known mourner’s hat, its shape is that of an enormous toupee, and the face is completely covered with a black veil. The Veil of Dayoko of Baro is white, as being the plainest and most unpretending, is worn in mourning and during out-door labour. It is cheap and will wash. Dark blue is the common colour for ordinary wear. A white head-dress is often worn in mourning.

Women wear as mourning a dark blue felt cap, which they wear on the chin, and the mourners blacken their faces, and cover their heads with ragged mantles. The mourning colour of the dead is black, as is the case with the debris when a death occurs. At sunset it is taken off. Roman women put on black after a funeral. Black clothes as mourning are the fashion in ancient Greece and Rome, and Italy, modern Greece, and modern Europe generally. White mourning is recorded for Korea, Tongking, China, Spain, and the Imperial House for women, and in various parts of modern Europe.

In old England, white scarves, bandanas, and gloves were worn at the funerals of infants and the unmarried. At Singapore a white sash is worn, but apart from this there is no mourning costume in Malaysia.

Mourners among the Tahle people wear dark blue clothes, which they assume as soon as the burial is over. Among the Yoruba, the women wear blue or white. Among the Eora of Bophany blue hat is worn, or merely a blue thread is placed round the arm. This fashion is paralleled by the men of the Midland country, who wear a blue band round the sleeve. In parts of Germany blue is worn as mourning by women, and in parts of Egypt the blue dress is worn by women as mourning.

Aragon, Guatemala widows dyed themselves yellow. Women who wore dark blue clothes in mourning for Euphrades. Grey was the mourning colour of the Guambiotels. It is said that the latter custom has originated in the idea that the mourner is more or less polluted for a certain period, and that therefore a dress worn by him then, being a seat of contagion, could not be used afterwards. But such customs originate in unconscious motivation. Of course, concealment may be aimed at, unconsciously. But several considerations place the theory of disguise out of court. Savage philosophies seldom hold on correct explanations; being ex post facto, they are out of touch with origins. But they do refer to present conscious motives, which again may not be the underlying primary reason.

Savage philosophies seldom hold on correct explanations; being ex post facto, they are out of touch with origins.

Again, the prevalent custom of wearing the clothes or the bones of the dead is an absolute negation of the principle of concealment. On anamistic theory these appurtenances should attract the ghost.

Fowler notes that the customs of blackening the face and of cutting the hair after a death are observed not only for friends but for slain foes, and suggests that the latter is the explanation of their use as being a mark of sorrow cannot apply. They may therefore, he adds, be explained as intended to disguise the slayer from the angry ghost of the slain.

The practice of blackening the body and the wearing of special costumes by mourners is attempts to disguise themselves as to escape the notice of the ghost.

Westerman is of opinion that the latter custom may also have originated in the idea that a mourner is more or less polluted for a certain period, and that therefore a dress worn by him then, being a seat of contagion, could not be used afterwards. But such customs originate in unconscious motivation. Of course, concealment may be aimed at, unconsciously. But several considerations place the theory of disguise out of court. Savage philosophies seldom hold on correct explanations; being ex post facto, they are out of touch with origins. But they do refer to present conscious motives, which again may not be the underlying primary reason.

The motive of disguise may have been accompanied by some original unconscious motive, but the following cases show that the opposite may exist. In some of the Central Australian tribes it is said that the object of painting the body of a mourner is to render him or her more conspicuous, and so to allow the spirit to see that it is being properly mourned for.

with ashes, soot, and the like is found in America, Africa, New Guinea, Samoa, and very generally throughout the world.\(^1\) The precise reason for the choice of this medium is obscure.

When spiritualism has once become a part of society, it lives on its own vogue, confirmed into the complex of current motives without cancelling the deep-seated original motive of the unconscious mind. Mourning dress, for example, may take on the character of spiritual armor, as a defense against the evil spirits who often act as a syndicate of death, removing and devouring the souls of the living. A Chinese found the grave-diggers and coffin-bearers tie their shadows to themselves by tying a cloth round their waists.\(^2\) A Northern Indian murderer wraped himself up tightly. The custom of blackening the face with ashes has perhaps the same meaning. In the primitive camp the most obvious medium for dirtying the person is, not the earth, but the ashes of the camp-fire, which with a little boiling water will stick in coal countries, a dye as well as a defilement.

A paradox similar to one already noted is the result of this adaptation to state; and, sorrow, and with it an equality of derogation, is the different feelings of state. The dead man is dressed in his best, arrayed like a 할로送 in all his glory; for the last time his personality is augmented to superhumanity, while his habits temporarily assimilate themselves to his actual state, socially substitute themselves for him, and practically negate and cancel his living personality and abrogate their social functions.

2. \(\ldots\).—When clothing is firmly established as a permanent social habit, temporary nudity is the most violent negation possible of the clothed state. Ceremonial nudity is a complex problem, but the idea of contrast, of an abnormal as contrasted with a normal state, may go far to explain many of its forms. At ceremonies of emigration the Malay takes off his strange.\(^3\) Such cases are not doubt due to ceremonial in a way; the psychological influence has more effect when the body is stripped of all coverings. But other examples of the practice are more obscure.

\(\ldots\).—In time of drought, Transyliovian girls strip naked when performing the ritual for rain.\(^4\) In India the practice is regular.\(^5\) To make rain, Keboni men go on the roof of a house at night, and strip themselves of all clothes. Obscene language is interchanged.\(^6\) To induce rain to fall, Ha-Thonga women strip themselves naked.\(^7\) Barunga women, to make rain, strip themselves of their clothes, and put on instead leaf-girdles or leaf-petticoats and head-dresses of grass.\(^8\) At a festival of Somnuri, Bengali students danced naked. A Guajarati mother whose child is ill goes to the goddess's temple at night, naked, or with only a girtle of mela (Melia) or amanso (Poligalath) leaves.

The principle in the above seems to be that a violent change in the course of Nature may be assisted by a violent change of habit on the part of those concerned. It is adaptation to the desired contrast by instituting a contrast in the olitians.

The use of obscene language is, like nudity, a break with the habits of normal life. The use of leaf-girdles is probably no survival of a clothing, but merely a method of touching down the

DRESS

violation of the extraordinary state. Similarly, the idea of nakedness is often satisfied by the removal of the upper garment only. Ideas of fertility and outpouring as connected with leaves and with the genital organs are probably later.

The whole subject is illustrated by the following: "In Eskimo and Chukchee the garment becomes brief before the fishing season. Every evening he strips himself of all but a garment, a proceeding not otherwise allowed, and bares near the location of the dugout.1 An Eskimo may not even strip and walrus on the same day, unless he strips and bathes the following day.2 In dealing with a ghost who has been worn, he will then wash and bathe the whole body before eating walrus; he may strip himself before eating seal.3"

The principle of assimilation to special circumstances is here conspicuous. Possibly in the New Guinea example the later extension of the principle to assimilation by contact is involved.

Dress, as will be more fully illustrated below, not only essentially a social habit, but one of the most distinctly social habits that have been evolved, the public removal of garments and nudity generally come under the regulation of custom and law. Dress, like other habits, is a second nature, and social inertia may fix it more securely; hence still the legalism as the pronouncement of Zoroastrian law, that it is a sin to walk with only one boot on.4

The sexual instincts of modesty and attraction give life to the idea of dress, and a balance is seldom exactly attained between them and legitimacy. In modern times the missionary movement has practically removed many a wild race by imposing upon them, as the most essential feature of Christendom, the prohibition of clothing and the development of a cold climate among peoples inclined to prudery and ascetic ideals; hence a factitious sentiment of hypocritical decency. In other races, however, nakedness has evolved similar conditions.

In Japan it is a capital offense to strip naked.5 In most European countries 'exposure of the person' is a criminal offense. The Roman Catholic Church taught, and still teaches in convent schools, that it is wrong to expose the body even to one's own eyes.6 'Modern modesty was carried to great lengths, insufficient clothing being forbidden.7 The Roman prescribes that a man shall not uncover himself even to himself, and shall not wash naked—fear of God, and of spirits.8 Job did so, and atoned for it.9 When in Arab antiquity grown-up persons showed themselves naked, it was only under extraordinary circumstances and to attain unusual ends.10 These latter have been illustrated above.

Such excess of the idea of decency renders still more important the peculiar beauty of the superstitious use of nudity and also its sexual appeal. In the sphere of art it may be the case that peoples accustomed to nakedness, like the Greeks, employ it in a regular subject for artistic treatment, but it does not necessarily follow that it is better understood than among peoples not so accustomed. It lacks the force of contrast. Similarly in the sexual sphere, both natural modesty and natural expansion may be enhanced by the artificial limitations of decency. In this respect dress plays an important part in social biology. By way of showing the contrast, the African and the European conditions may be sketched.

Of the Wa-tavela, Johnston remarks: 'Both sexes have little notion or conception of decency, the men especially seeming to be impervious of any impropriety in exposing themselves. What clothing they have is worn either as an adornment or for protection against the heat in night and early morning. Of the Wa-chagas he observes: 'With them indecency does not exist, for they make no effort to be decent, but walk about as Nature made them.' When the child is old enough to look unusually smart, in which cases they throw cloth or skins around their shoulders.11

Among Englishmen, a race very observant of the deccencies of civilization, Herrick is fairly typical. His attitude to sexual display is described by Beale Griffiths:12 'The fascination clothes in the lover's eyes is, no doubt, a complex phenomenon, but in part it rests on the aptitudes of a woman's garments to express vaguely a dynamic symbolism which must always remain indefinite and elusive, and on the character of the spectator who possesses fascination. No one has so accurately described this symbolism as Herrick, often an admiral of fancies in matters of sexual attractiveness. Especially instructive in this respect are his poems, "Delight in Disorder," "Upon Julia's Clothes," and notably "Janet Peacock." "A sweet disorder in the dress," he tells us, "bindles in clothes a wantonness;" clothes are not on the garment itself, but on the character of his movement that he irritates; on the "erring hole," the "winning wave" of the "tempertous petticoat."13 Henn, of course, may have been thought of in the clinic, and its meaning is hardly less explicit in the English and European milieu.

The significance of dress as an expression of the body will be referred to below in the sexual connexion. Meanwhile the general idea thus illustrated may be regarded as the norm in modern civilization. Its opposite or complementary is the increased value given to legitimate nudity. A movement is even proceeding, particularly in Germany, for an extension of this individual privilege into a restricted and occasional social habit—the so-called Nacktheit movement.

Such tendencies coincide with the twofold attitude towards the human organism which dress has emphasized—first, for the body in itself and regard for its artificial extensions, and second, periodic social phenomena accentuate one or the other aspect. The Spartan practice of nudity in athletics was based on a reasoned theory of health from exposure, and of the effect of clothing as a restraint. The Greeks have been said to 'glory in their nudes, and consider clothing fit only for women.2 Temporary nudity, when in obedience to natural impulse, should be regarded not as a perversion, still less as a survival of a primitive state, but as a rhythmic movement. The point is well illustrated by the use of nudity as a love-charm.

9. Dress and social grade.—Dress is the most distinctive expression in a material form of the various grades of social life. The biological period thus becomes a social period of existence, and the individual is merged in a functional section of the community. The assumption of a grade-dress is, whether explicitly or implicitly, ipso facto a social rite—in Van Gennep's term, a rite of aggregation.

(1) Childhood.—The swaddling-clothes of infants have their analogue in the earliest cultures, in the form of the animals mentioned of the pacuico system. In this the reasons of protection and cleanliness are obvious. After infancy the children of primitive peoples are quite naked in the warm climate. In colder climates they are assumed either at puberty or at the age of six or seven. Probably the former date represents an earlier stratum of fashion. Children, whether first clothed at the earlier age or not, assume adult costume at puberty.

In the New Hebrides, girls and boys are naked till five years of age. Among the Veddas dress is assumed at the age of six or seven. Children of well-to-do Hindus are naked till the third year, those of the poor till about six or seven.2 Running about uncovered, say the Zoroastrian texts, is no sin, up to the age of 15; and it is no sin to be without the sacred girdle till that age.3 In cold climates, where the constant purpose of dress is protection, differences of juvenile and adult costume may be reduced. For example, Sambayned children 'are dressed precisely as their parents, sex for sex.'4

There is little to notice in the matter of coiffure in the child-stage. Cases like the following are exceptional:

Young Naga children have the hair shaved. When a girl is of marriageable age, it is allowed to grow long.5

3. Phalavi Texts, 1, in SBE v. 297.
4. B. Ellis, Jr. 22, quoting authorities.
5. Weilhans, Rede, 173, 190.
6. JAF xi. (1890) 9, 11.
(2) Maturity.—Examples of the ritual assumption of the adult garb may be confined to a few types.

In Florida (Melanias) the male 'wrapper' is assumed with some ceremony at the age of six or seven. In Santa Cruz the adult male is crowned. His assumption is celebrated by a feast and pickling. Big boys whose parents are too poor to give them a proper garment have been known to grow up without one. The customs in the New Hebrides is the same, and after assumption the boy begins to be reserved towards his mother and sisters. The New Guinea boy is the first to acquire a skirt, loin-cloth, from his maternal uncle, rurum, to whom in return he offers certain objects of value as a sign of appreciation of his patron. The rurum makes the cloth, and puts it on the boy in the presence of the relatives on both sides of the family, who then eat together. A similar ceremony of investiture at puberty is practised by the Ioro tribes.

The last initiation of a New Hebrides boy is the investing of the belt. This is a broad band of nutangi bark about six inches wide, encircled with the waist twice and confined by a small strip of plaited grass. 'An untied rope' is the general word for the scooped-out sides of the native's belt. The belt is therefore an ornament, corresponding to the toga virilis, but usually not studded (from inability to provide pins for the feast) until a man is twenty or older. The old Japanese made a ceremony for the assumption of the above belt, which was called the 'kabuto' of girls.¹

The Hindu yamagopa is the equivalent in the sacred objects of the toga virilis, but is not, in religion, a 'person,' not as, if it were, individualized, not even named. The thread is of three slender-cotton filaments, which are wound in a bundle, each of these three consisting of three finer filaments. It is consecrated by sprinkling or is sprinkled, before it is put on. The wearer never parts with it. At the Buddhist church, the priest changes his vestments, so the Buddhist alters the position of the thread. When he is married, he is put on under his right shoulder; when he worships ancestors, the position is reversed; when he is a monk, it is worn on the left shoulder.¹ The earliest mention of this sacred cord, gajaparika, of the Brahman, is perhaps in the Upasagopa.² Worn over the left shoulder, it probably symbolizes the passing of the sacred thread which the warrior is engaged. This gajaparika is of one skein when put on the youth; when it is married it must have three, and, hence, it have five skeins. An initiation cord is put on first, then taken off and the real one put in position. Then the father covers his son with the sacred thread, with its head under the head, and whispers the Gayatri prayer. A cord is put on every year at the festival of Kurukshetra, the cord may never be replaced. The Sunyati, having entered the fourth or last stage of the Brahman's life, does not wear the gajaparika.³ Mani says that the first birth of a Hindu is 'from his natural mother, the second happens on the tying of the girdle of Mudgagnip, and the third is the initiation to the performance of a Sartuta sacrifice.'¹ 'Birth' in such contexts as the assumption of the adult state is an almost universal metaphor. In many well-known instances the metaphor itself has been translated into ritual, as being a convenient and impressive mode of affirming the change. But neither the metaphor nor the idea of re-birth is the ultimate reason of initiation ceremonies.

The sacred thread-girdle, the kosa, worn by every member, male and female, of the Zoroastrian faith, after the age of 15, is a symbol of cleanliness, as a girdle is worn by all the Ormand and his fellows. Bread and water were to be refused to all who did not wear it. It must be made not of silk, but of coarse thread of 12 inches in diameter, and it should be sewed 'three times circumcised the waist.' The other garment made of mudgagnip is worn over the sweater, and a muslin shirt, with short sleeves, worn high, not lower than the hips. At its 'opening in front' is a pocket, 'the pocket for good deeds.' When putting it on the faithful looks at the pocket, asking himself whether it is full. Both skirt and girdle are to be kept on during the night, 'for they are more protective to the body, and good for the soul.' To wear the girdle is to wear one's kusa 'with the religion.'¹ The distinctive garb of the Athenian ephesos was the chlamys. It was ceremonially assumed. The Roman boy at sixteen laid aside the bolda and the toga porina and assumed the white toga of mankind, toga pura or ciris. The path in medieval chivalry was made a square at fourteen. At twenty-one the knight hooded followed, and new white robes were ceremonially assumed, with a satin vest and a leather collar, over the suit of mail. All before but not assumed till puberty. At puberty the Chaco girl is decorated, and for the first time wears the flaring skirt of the women.²

There are, of course, exceptions to the rule that the adult garb is a social dress in the true sense.

Thus the Me'ko tribe have no ceremony in connexion with the assumption of the male band or the female petticoat.¹ Elsewhere the rite involves such usual complications as the following. Before a boy is circumcised, the Masai father puts on a special dress, and lives secluded in a special hut. On his return he drinks wine and is called 'father of the house.' The title is associated with a recognized place. The designation of the father points to the fact, expressed by the dress, that fatherhood, as elsewhere, is a special social grade.

In many examples there is a distinctive dress worn during the passage of the initiate and discarded at the end for the adult dress proper.

Thus, during the initiation of a Kamokor youth he was invested with his long-sleeved, white, sleeveless tunic, and finally fell in a broad band against the feet. This dress was made and publicly placed on her head by a paternal aunt, who received at one time present from the young person's father. When three or four years later, the period of sequester ceased, only this same dress (with a centre mark) of the young person, a ceremonial head-dress. Furthermore, the girl's fingers, wrists, and legs at the ankles and immediately below the knees were covered with clay, and their garments and body spots sprinkled with clay as a protection against the malignant influences which she was supposed to possess. The next step in the grade of social puberty is generally equivalent to nubility.

Among the Atti people a girl announces her eligibility for marriage by a procession, the marriage being performed in the act in which the bridegroom is engaged. She is escorted through the streets, under an umbrella. In the betrothal ceremony, the woman made of New Hebrides, a girl betrothed in childhood wears nothing except on great occasions. When growing up she is clothed, but in the house wears only the pendant. In the house the marriage dressing and tattling are a step towards the marriage of a girl.¹ The Naga youth, on the other hand, the cord must be replaced. Only then does he assume the loin-cloth.³ Frequently a special dress or modification of the adult dress marks a distinction between maturity and nubility. Among the Kfora of New Guinea taiting is confined to the women. When a girl is engaged, the region between the naval and the neck, hilosororow, in a belt. Before marriage the Yehapped gado is tatted between the breasts.¹

The passage from childhood to youth, and from youth to nubility, is often marked by a change in the mode of wearing the hair. As an example, among Naga women the coiffure is a mark of status.¹ When dressing him or her in childhood, the hair is shaved, except for the front and a tuft on the crown; at puberty, the hair is allowed to grow, and is worn in chignon or braid form; when married, the head is shaved and hanging down the back; when they become mothers, they wear these plaited hairforms, which is similar to that of the women.

(3) Sexual dress.—The assumption of dress to initiate the social grade of maturity is the assumption of a social sexual differentiation. The most distinctive social division is the permanent division of sex. Up to puberty this is more or less ignored, and the neutral quality of the previous stage is often indicated by the neutral connotation of the term ‘child,’ and by a neutral fashion of child-dress. It is natural that the growth and maturity of the primary sexual characters should give these a prominent place in the principles of the distinguishing garb, and that they should, as it were, mould the dress into adaptive forms. The idea of social sexuality is well brought out in the stories of

children failing to distinguish girls from boys when nude. The adaptation of the distinctive feminine and masculine garments, skirt and trousers, to the activity of the respective sexes has already been referred to. There is a range of a material expression in a social form of the psychical reflexes from personality, and, in this case, sexuality, has here particular prominence. To regard the affirmation, by means of dress, of primary sexual character is to equate it to the sexual characteristic of the other sex by adorning them is a superficial view. Such intention is secondary, though, of course, it has an important social bearing. Goethe's remark is pertinent for the consideration of dress as an affirmation of personality: 'We exclaim, 'What a beautiful little foot!' when we have merely seen a pretty shoe; we admire the lovely waist, when nothing has met our eyes but an elegant girde.'

The primary sexual character of sexual characters may be illustrated by the following:

A type of female beauty in the Middle Ages represents forms clothed in broad flowing skirts, and with the characteristic shape of pregnancy. 'It is the maternal function, ... which marks the whole type.' The type possibly survived in that clenching of the breasts which involved an immense amount of expansion below the waist, and secured such expansion by the use of the corset and similar device. The Elisabethan farthingale was such a garment. This was originally a Spanish invention, as indicated by the name from cordobés, 'provided with a long skirt.' It was used in England throughout the stage. We find the fashion at its most extreme point in the fashionable dress of the Italian upper classes of the eighteenth century, since it has been fun- mortalised by Velasquez. In England, hoops went out during the reign of George II, but were revived, for a time, half a century later. A corset was worn in Victorian crinoline. Such a garment, however, is not exceptional to the view here expressed—it is, in fact, cor- receivably so, if the necessity of emphasizing feminine characters which is characteristic of the class—that this, like most other feminine fashions in dress, was invented by conscious or unconscious effort to effect the culmination of the distinctive feminine garment, the skirt, as a protection and affirmation of the feminine character.

Augmentation of the masculine character is similar. In medieval Europe an exception is found in a tendency to the use of compressing garments. The tightening of the waist girth is a remarkable adaptation, which emphasizes at one and the same time the feminine characters of expansion both of the breasts and of the abdominal and gluteal regions. 'Not only does the corset render the breasts more prominent: it has the further effect of displacing the breathing activity of the lungs, so that the upward direction, the advantage from the point of sexual allurement thus gained being that additional attention is drawn to the bosom from the respiratory movement thus imparted to it.' The development of the corset in modern Europe has been traced from the hands, or fascia, of Greek and Roman women. The tight bodices of the Middle Ages were replaced in the eighteenth century by whalebone stays. The modern corset is a combination of the fascia and the girdle.

In the sphere of masculine dress and the affirmation by its means of sexual characters, it is as well to refer to two medieval modifications:

The long hose which superseded the barbarian tights and preceded the modern trousers emphasized most effectively the male character. There is a special social quality of elasticity and activity of the lower limbs, the organs of locomotion. The fringings, or codices, of the 14th and 15th centuries is an example of a protective article of dress, originally used in war, which became an article of fashionable apparel, often made of silk and adorned with ribbons, even with gold and jewels. Its history supplies a modern repetition of the savage phallic cryp- crypt, and throws light on the evolution of the idea of dress.

With regard to secondary sexual characters, sexual dress, itself an artificial secondary sexual character, carries on various adaptations. 'The man must be strong, vigorous, energetic, hairy, even feathered, the body smooth, rounded, and gentle.' These characters are echoed in the greater relative coarseness and strength of fabric of masculine dress, and the softness and fluidity of the feminine. The sexual character of women is that of greater darkness of women is a secondary ... sexual character; in this connexion a harmony is un-consciously aimed at; the tendency is for men to wear darker, and women lighter dresses. Women tend to 'cultivate pallor of the face, to use powder,' and 'to emphasize the white underlip.' The attraction of sexual disparity, so important in sexual selection, finds its culmination in the matter of clothing, and it has constantly happened that men have even called in the aid of religion to embrace a distinction was worn by men, though not so universal. One of the greatest of sex allurements would be lost and the extreme importance of clothes would disappear at once if the two sexes were uniform. The picture of dress has, however, never come about among any people.'

The assumption of sexual dress at maturity raises the question of the original meaning of special coverings for the primary sexual characters. Their probable origin in an impulse towards protection against the natural environment has been suggested. When dress becomes more than a mere appendage and produces the reaction of an affirmation of personality, its meaning inevitably be- comes richer. The decorative impulse and sexual allurement take place in the complex. But the chief, and the distinctively social factor, is the process of affin- ing the female and the artificial intimation the particular physiological stage which society transforms into a human grade of communal life. This is well illustrated by such facts as the frequent absence of such dress as, for example, until marriage, and, more significantly, until pregnancy or motherhood. In other cases, as in the frequent confinement of sexual covering to the primary region, the principle is still logically followed. Thus, among many negro peoples, as the natives of Lounge, women cover the breasts especially. Naga women cover the breasts only. They say it is absurd to cover those parts of the body with which one has been able to see from their birth, but that it is different with the breasts, which appear later.

The evolution of sexual dress involves some side-issues of thought and custom which are not without significance. The harmony between the ideas of sexual dress and its temporary disguise for natural functions is brought out in many customs and aspects of thought. The following is an instance:

The Mecke tribes of New Guinea have folk-tales of which the motive is that a man surprising a girl without her dress. His petticoat is still the custom for the husband to fasten ceremonially the bride's petticoat, and the ceremonial binding of the virgin zone embodies similar ideas.

Savage folklore is full of stories connected with disparity of sex-dress. Different dress is worn in different peoples leads to comment when coinci- dences occur. The Dinka call the Bongo, Mittoo, and Niam-Niam 'women' because the men wear an apron, while the women wear no clothes whatever, getting, however, daily a supper bough for a girdle. Sexual disparity, natural and artificial, has often led to speculation.

Repudiating the sexual element, Clement of Alexandria argued that, the object of dress being merely to cover the body and protect it from cold, there is no reason why men's dress should differ from women's. The Naga of Manipur say that originally men and women wore identical clothes. The first human beings were seven men and seven women. By way of making a distinction the man made his hair longer or, if he were a woman, grew a beard. After any marriage he used still the custom for the husband to fasten ceremonially the bride's petticoat, and the ceremonial binding of the virgin zone embodies similar ideas.

Savage folklore is full of stories connected with disparity of sex-dress. Different dress is worn in different peoples leads to comment when coinci- dences occur. The Dinka call the Bongo, Mittoo, and Niam-Niam 'women' because the men wear an apron, while the women wear no clothes whatever, getting, however, daily a supper bough for a girdle. Sexual disparity, natural and artificial, has often led to speculation.

Spinning, weaving, dress-making, and connected arts have been the work of women until modern
times. Before the rise of organized industry, every family was self-sufficing in the production of clothes for its members. Washing and repairing of women’s work, daily with cookery. In barbarism, as among the Chaco Indians, all the making of clothes is done by the women. The men’s large and cumbersome blankets each took months to weave.1

In the lowest stages each adult prepared and looked after his or her attire. As soon as manufacture began with bark-cloth, the preparation of the leaf was the business of women, like other sedentary and domestic arts; but, since the style of the dress depended not upon measurement and cut, but upon folds and draping, women were not actually the makers of dress. In the ancient civilizations the slave-system of industry was applied in two directions. Skilled male artists were employed irregularly by the luxurious; while the regular method of domestic manufacture came to include dress-making and tailoring. Among the ancient Greeks and Italians the making of clothes was carried on in the house by the female slaves under the supervision of the lady of the house. This system gradually gave way to one of more modern fashion, though the attire still retained its claims upon domestic art up to modern times.

In modern civilization the broad distinction of sexual dress has reasserted itself in the sphere of occupation. The dress of men is prepared by men, that of women by women. Special knowledge rendered this inevitable, as soon as cut and shape superseded draping in both female and male attire. But, as in other arts, the male sex is the more creative, and the luxurious women of modern society are largely catered for by male dressmakers.

In the majority of modern nations the care and repair of the clothes of the family is part of the domestic work of women. The washing of clothes is usually women’s work. Yet in Abyssinia it is the man who washes the clothes of both sexes, and in this function the women cannot help him.2 In the sphere of industry Chinese men provide another exception.

(4) Wedding garments.—The sexual dress is at marriage intensified by the principle of affirmation, not of sexuality, but of personality. It is an occasion of expansion, of augmentation; as the social expression of the crisis of love (the culmination of human energy and well-being), it is precisely adapted for the free play and work of super-humanity, and are treated as royal persons. A special and distinctive dress for the bride is a widely spread fashion. As a rule, the bride herself is supposed to make the dress. With marriage, housekeeping begins and, as in Norway, Scotland, India, and elsewhere, the bride supplies the household linen, often including the personal linen of the husband. The variety of wedding dress is endless. Frequently each family supplies the other.

In North India the bride’s dress is yellow, or red—colours which ‘repel demons.’ The Majhwar pair wear white, but after the anointing put on coloured clothes.3 English brides wear a white dress. So did Hebrew brides. On many occasions it is directed that a bride must wear ‘Something old, something new, something borrowed, something blue.’ The Hindu bridegroom supplies the cloth for the wedding dress of the bride. The fact is (as below) that there is an old Hijius, not merely a dowry, but an inter change of ornament and clothes being the principal ingredients. When presented, the clothes are put on; this forms a preliminary marriage-ceremony,4 The gorgeous flowered embroidery, which is part of the bride’s dress in their wedding dress.

Magnificence, generally, in the characteristic of wedding garments throughout the world; white is the frequent, and white and red are the most common of women’s wear, especially with cooks. In barbarism, as among the Chaco Indians, all the making of clothes is done by the women. The men’s large and cumbersome blankets each took months to weave.1

The Korean bridegroom elect often betrothed at the age of five, wears a red jacket as a mark of engagement.5 On the day before marriage the Roman bride put on the toga praestans, which was deposited before the Larci, and put on the tunic vesta or regula, ornamented in a universal Latin fashion way. It was fastened with a woolen girdle tied in the knot of Hercules, nodus Herculis.6 In European folklores an analogue is to be found in the true lover’s knot, the idea being a magical and later a symbolical knitting together of the wedded pair. The hair of the bride was arranged in six locks, and was ceremonially parted with the osilartar hasti. She wore a wreath of flowers, gathered by her own hands.7

Some cases of investiture follow.

On the wedding night the bride of the Kolia people is decorated. Coco-nut oil is put on her thighs. She wears a new petticoat. Red lines are painted on her face, and her arms are painted. Her hair is combed and anointed with oil, and in her locks are scarlet Ailidius flowers. The groom wears a head dress of cassowary feathers; his face is painted red and yellow streaks, and his ears are decorated with dried tiges of pips.7 The Hindu marriage is invested with the two additional skeins necessary to make the full complement of the pashyagari, the sister’s robe of the married man. The Japanese bridegroom is dressed in the manner of a chief. The idea is to represent him as of exalted rank.8 The Malay term l. bridegroom rankasah, the ‘one-day king.’9 The dressing up of both bride and groom and all parties present, for the bridal procession of the Minangkabau is, very remarkable.

The bridal veil, originally concealing the face, occurs in China, Korea, Manchuria, Burma, Persia, Russia, Bulgaria, and in various modified forms throughout Europe and the majority of great civilizations, ancient and modern. In ancient Greece the bride wore a long veil and a garland. The Druse bride wears a long red veil, which her husband removes in the bride’s chamber after the Egyptian veil, boorlo, conceals all the face except the eyes, and reaches to the feet. It is of black silk for married and white for unmarried women.2 Various considerations suggest that the veil is in origin rather an affirmation of the face, as a human and particularly a sexual glory, than a concealment, though the emphasizing of maidenly modesty comes in as a secondary and still more prominent factor. The veil is sometimes a symbol of the expression of the head and the hair. These are also augmented by various decorations.

The wedding dress often coincides with, or is equivalent to, the grade-dress of the married. The stola as a woollen alabaster for the distinctive garment of ancient Roman wives.6 It was an ample outer tunic in design, and possibly to be identified with the bridal tunic red. Among the Hereros, after the wedding meal, the bride’s mother puts upon the bride the cap and the dress of married women.10 The ‘big garment,’ ear-rings, and the iron necklace distinguish Masai married women from girls.11

Further social stages are marked by distinctive dress, such as pregancy, motherhood, and, more rarely, fatherhood. As soon as a Wa-tavetia bride becomes pregnant,1 she is dressed with much display of beads, and over her eyes a deep fringe of tiny iron chains is hung, which hides her and also prevents her from seeing clearly. An old woman attends her, to screen her from all excitement and danger until the last moments of its taken place.12 Among Cameroson tribes is found the custom of

DRESS

65

Dress of China.—One of the longest and most curious articles in the history of dress is that dealing with the garb of permanent sacred grades, priestly, royal, and the like, and of tempory sacredness, as in the case of worshippers, pilgrims, and victims. Some examples have been incidentally noticed; a brief reference to certain types must suffice here.

In ancient India the ascetic had to wear coarse, worn-out garments, and for this reason was called a dhoti, or tattered garments—the term may include bark- or grass-cloths—and his hair was braided. The Shvetaks wore clothes not old or dirty. He wore a sacred string. He had forlorn garments, shoes, or string which had been worn by others. The student for the doctor's dress wore the skin of an antelope or other animal, for his lower garment a cloth of hemp, or flax, or wool. He wore the girdle of a Brahman, a triple cord of Mulli grass. A Kisthendra wore as his cord a strip of cotton, a cord of hemp. The religious character of this caste-system renders the locality of some of the last grade conventional.

Temporarily, in worship and on pilgrimage, the ordinary member of an organized faith assumes a quasi-sacerdotal character.

For the haji to Mecca the Muslim must wear no other garments than the ihram, consisting of two seamless wrappers, one passed round the loins, the other over the shoulders, the head being uncovered. The ceremony of putting them on at a pilgrim’s ‘station’ is at-ihram, ‘the making unlawful’ (of ordinary garments and behaviour and occupations). The ceremony of taking them off is at-thalid, ‘the making lawful’. The haji shaves his head when the pilgrimage is over. According to some, the ihram is the shroud of the event of the hajj’s death. More likely it is preserved and used as a shroud when he dies. The most important item in the costume of Japanese pilgrims is the ozuma, a jacket which is stamped with the seal of each shrine visited. They may wear three headdresses or the headgear of the cloth might be sewn on. The garment is not always carefully preserved after the return home, and when the owner dies it is said in it for burial.

The dress of worshippers varies between ‘decent apparel’ and garments of assimilation to the god or the victim or the priest. As in the case of lal-worship, the garments were often kept in the shrine, and assumed on entrance. In certain rites both Dionysiac and his worshippers wear skins. The Bacchanals wore the skins of goats. The veil of the worshipper has been referred to. In the earliest Christian period a controversy seems to have taken place with regard to female head-dress during worship. In the modern custom the male head-dress is removed, the female is retained. Academies sometimes preserve the rule of a special vestment for worshippers, whether lay or priestly.

It has been noted that the dress of jogeours, triumvirates, and troubadours was an assimilation to the sacerdotal. From the same medieval period comes the code of ‘singing robes’. The singer’s habit is a garb of dress or of costume.

(7) Priestly and royal robes.—The dress of the sacred world tends to be the reverse of the profane. Apart from the impulse—to be traced in the mentality of medicine-men—to impress one’s personality upon the audience by the fantastic and the grotesque, there is here the expression of the fundamental opposition between natural and supernatural social functions.

The garb of Tai priests and priestesses differs from ordinary dress. Their hair is long and unkempt, while the lay fashion is to wear it short. The laayan, when they do, wears bright clothes; the priest may wear only plain clothes, which is depicted in the monk’s red-yellow with mangrove-tan. Priests and priestesses, when about to communicate with the god, wear a white linen cap. On holy days they wear white cloth, and on certain occasions, not explained, their bodies are painted with white clay. White and black bands are generally worn round the head. The Ewe priests wear white caps. The priestesses wear steel-crowned hats with wide hats. The Priestess wears white ceremonial used in the wear ‘grey clothes’ reaching to the feet, and a kerchief over the breast.

The survival of some antique modes often suffices, through various accidents and modifications, for the priestly garb, other than sacerdotal vestments. Thus, the raiment, a small antique mantle, was a ‘law of Mark’ (sacramentum, ch. vi. 40), and worn in forest countries.

DRESS

worn by the magister of the Fratres Arvales and by camilli generally.

The history of the dress of the Christian priest-
hood is a long one. Here also we find the principle of opposition to the lay-garb.

The democratic and non-professional character of primitive Christianity may be seen in the fact that in A.D. 165 Pope Alexander I ordered Gallus the bishops who wore dress different from that of the laity. They had been monks, and retained the pallium and girdle instead of assuming the tunic and toga of the superior layman. It is curious that the social differentiation of dress to mark differentiation of social function was resisted so long. But in the 6th cent. the civil dress of the clergy automatically became differ-
ent from the dress of the country, since, while the laity departed from the ancient type, the clergy withstood all such evolution. Thus, in the Western Empire the clergy retained the toga and long tunic, while the laity wore the short tunic, though not quite the same as the tunic of the laity.

The characteristic garb of the Christian clergy, both civil and ecclesiastical, was the long tunic. Originally it appears to have been white. Then its evolution divided; the alb derived from it on the one side, the civil tunic in sober colours on the other. For the civil dress the dignified toga was added to constitute full dress; for use in inclement weather the camara or cappa, an overcoat (plisseale) with a cowl, was adopted. The last-named garment similarly divided into the ecclesiastic cope, and the civil over-cloak. The long tunic still survives in three forms—the surplice, the cassock, and the frock coat. Its fashion in the last instance superseded the toga, which again survives in the academic gown.

The evolution of vestments is in harmony with the psychology of dress generally, and in many aspects illustrates it forcibly. With the vestment the priest puts on a 'character' of divinity. By change of vestments he multiplies the Divine force while showing its different aspects. The changing of vestments has a powerful psychical appeal. The vestment symbolizes his mission from the human and the supernatural; it absorbs, as it were, the rays of Deity, and thus at the same time inspires the human wearer. The dress is accordingly regarded not as an expression of the personality of the wearer, but as imposing upon him a super-

personality. This idea is implicit in every form of dress. Dress is a social body-surface, and even in sexual dress, military uniform, professional and official attire, the properties of the state inherent in it is often quite explicit. Further, the dress gives admission to the grade. In particular cases of solemnity a dress serves to fix the person's sacred function. Thus the Australian messenger is sacred by reason of his red cap.

A temporary sacred garment may even be used sacrificially. At the Zulu festival of the new fruits, the king danced in a mantle of grass or other herbs and corn leaves, which was torn up and trodden into the fields. In such cases there is

perhaps a reverse assimilation of virtue from the sacred person.

Royal dress in civilization tends to combine the principles of military dress and the tradition of the long robes of ancient authority. The subject needs a special analysis. The distinctive head-
dress, the crown, probably is an accidental survival of a military headgear. Among the Franks was a mark of royalty. But its significance is in line with the general principle, and it is essentially an affirmation of the dignity of the head, the crown of the human organism. Among the barbarians, social authority tends to adopt a specific garb.

The headmen of the Naga wear a special dress. The priest-

ingen for believing a distinctive role in the Roman land tribes commissioned the man who buried the dead chief to cover the new chief with a red blanket. This he does, at the same time hitting him hard on the head.

Ideas of purity readily attach themselves to priestly and royal garments. In the following cases it seems to be some survival from Zoroas-

trianism. Among the Kafirs of the Hindu Kush, men preparing for the office of headman wear a semi-sacred uniform which may on no account be defiled by coming into contact with dogs. These men, anarata, were nervously afraid of dogs, which had to be fastened with a long chain. The garments was seen to approach. The dressing has to be performed with the greatest care, a place which cannot be defiled with dogs.

Other less prevalent details of royal raiment are such as the girdle and the veil. In ancient Tahiti the king at his investiture was girded with a sacred girdle of red feathers, which was a symbol of the gods. In Africa velling the face is a general custom of royalty. The pall of the Persian monarchs, originally bestowed by the Pope, typifies their sacred function.

There is a tendency for each article of a royal panoply to carry a special symbolism, significant of the kingly duties and powers, just as the articles of the sacerdotal dress express Divine functions and attributes.

(8) The dress of the gods.—Frazer has shown reason for believing that the costume of the Roman god and of the Roman king was the same. Probably the king was dressed in the garments of Jupiter, borrowed from the Capitoline temple. In the earlier theory of society the gods are a special class or grade in the community. Their dress has not infrequently been an important detail in the social imagination, and has even formed a considerable item in the national budget. In so far as they are used for super-human purposes it is evident that they are to be thought of as united with a particular sacred function. Thus the Australian messenger is sacred by reason of his red cap.

16 Pasch, ii. 18, 212.
Before starting work they purified themselves with water and the image of sacred garlands. The druids, at the Druidic altars, wore a mantle and a shirt of white wool. Zeus in an oracle commanded Osiris or to give Osiris his new clothes. The image of Hera at Samos possessed a wardrobe of garments, white, blue, and purple; some were for wear, some for use. The bronze statue of Bacchus in his mount, a goat he was riding on his spatial, was of the Satyrii. We can speak of the Satyrii as a garland of fine lines. The image of Brauronian Athena wore a veil, and the woman, offered by devout women, the same was the case with the image of Ili baph at Agrigum. The magnificent robe, first used as a veil for Athena at Ephesus, became embracing the body, was seen in the image of Athena at the Panatheneum, is famous. The image was the old woman the goddess had beheld when the robe was placed on the body. This was even worn every fourth year by two Archepheides.

The dress of the god not seldom becomes a thing in itself, just as the dress of a priest or a king may itself be his substitute. The Polynesians employed figs in many ritualistic ways. Idols were robed in choice clothes. Every three months they were brought out, exposed to the sun (the term for this being mokes), re-annointed with oil, and returned to their wrappings. The god was supposed to be contained in a bundle of clothes. Matting and sinnet were similarly used. Pano, the Sasanian god of war, was 'nothing more than a piece of old rotten matter about 3 yards long and 4 inches in width.' These were covered with 'curiously netted sinnet,' just as the sbeleš at Delphi. In Mangaia the gods were 'well wrapped in native cloth.' one god was 'made entirely of sinnet.' The Tabitian word for sinnet is na, and the first enemy killed was called nak, because a piece of sinnet was tied to him. 10

The term 'ephol' in the OT apparently bears three meanings. (1) 'A great and chosen dress of priests' cloth.' Not over the 'robe' but the 'ephol,' it was made of gold, threads of blue and scarlet, and fine linen. Its shape and character are doubtful. Held at the shoulders the priest's hands, it was bound around the waist with a 'curious girdle.' (2) The term seems to be used for a garment set apart from the main. (3) There is the ephol which is an image, or its equivalent. Passages like Jg 8:32 make it difficult to interpret as a garment. But, apart from questions of grammar, which in some cases is very obscure, it is possible to regard the ephol as a worshipped garment, the practice being found elsewhere, or as a garment enclosing or covering an image. 12

Various Divine objects, symbols, or emblems may be clothed. In Uganda a jar swathed in blood and decorated so as to look like a man, represented the dead king. 13 The Bhagata make an image of wood and put clothes and ornaments upon it. It is then sacrificed. 14 Such cases involve impersonation. Even an emblem like the Cross, when carried on Good Friday, or sacred contours like the Kalasha and the laydéš, when clothed, decorated, or veiled, acquire a certain personal quality. The line is not always easily drawn between covering and insignia.

In the highest stages of theistic imagination the dress of a god tends to be metaphorical. He is clothed with the blue sky, with clouds, with thunder, with majesty, power, and splendor.

A. The dress of victims. By dressing an inanimate object, an animal, or a plant, a human quality is placed upon it. It becomes a member of society, by which capacity its saving force is enhanced. It does not follow that being so garbed it is a substitute for a previous human sacrifice. Even gifts may be so personalized. The Malay dress and decorative biflodes which are presented as a gift. 15 But the principle is remarkably dominant in the case of sacrifices and effigies. 16

B. There are cases of a reverse impersonation: 17

After killing a domestic animal, a wild boar, and dance round him, saying that they had not slain the bear. 18 When Nütkas had killed a bear, they put a chief's bonnet on its head and offered it food. 19

Ordinary impersonation is more frequent. Russian peasants dress a birch tree in woman's clothes. 20 At the Little Dance of the Dukhobors, a woman dressed a wooden image made roughly from a tree, and decorated it as a bride. 21 The last ahead of corn and similar representations of the corn-spirit are dressed in woman's clothes. The priests of the Yezidis of Persia had a similar rite, and dressed a bunch of maize in women's clothes and offered it as the corn. 22

The image of 'Death' in Transylvania is dressed in 'the holiday attire of a young peasant woman, with a red hood, silver brooches, and a profusion of ribbons at the arms and breast.' 23 The Iroquois sacrificed two women, one to dart him a bull; weapon, feathers, and ribbons. 24 The human scapgoat of Thrangia was dressed in mourning garb. 25 The scapegoat of Massilia was dressed in woman's clothes.

The mock-kings in various lands are dressed in royal acts, actual or sham. 26 The reasons for the various dresses just enumerated are sufficiently clear.

Dress, by personalizing a victim, provides a convenient method of substitution. When the Oracle ordered the sacrifice of a maiden, a goat was dressed as a girl and slain instead. 27 Such cases may be attributed to priestly myths, but the practice was probably actually occurred. It does not follow, however, as has already been urged, that all cases of a humanly clothed animal or vegetable victim represent substitution for an originally human sacrifice.

The principle of assimilation to a particular environment, which is the focus of the ceremony, has striking illustrations.

In a folk-drama of Moravia, Winter is represented by an old man muffled in fur, and wearing a bearskin cap. Girls in green danced round a May-tree. 28 A common practice in European and oriental folklore is dressing an image representing the spirit of vegetation in flowers or leaves. 29 In time of drought the Serbs took a girl to the oak, dressed her head to foot in grass, herbs, and flowers, even her face being hidden behind a veil of living green. Thus disguised she is called the Dodoša, and goes through the village with a troop of girls. 30 A remarkable case is seen in Suban ritual. When a sacrifice was offered to the red planet Mars, as Longleat calls it, the priest wore red, the temple was draped with red, and the victim was a red-haired, red-cheeked man. 31 The girl—victim sacrificed by the Mexicans to the spirit of the rain, was painted red and yellow, and dressed to resemble the plant. Her blood was supposed to recurit the soil, she was termed Xalayuita, 'she who is clothed with the sand.' 32 The similar victim of the Earth—goddess occupied her last days in making clothes of ash leaves. These were to be the right dress of the maize-god. The next victim, a man, wore the female victim's skin, or rather a simulation of it, as a living image was clothed in the skin of the victim. 33 The victim of Tzocalticopa was invested for a year with the dress of the god. Sleeping in the daytime, he went forth at night attired in the god's robes, with a girl as his companion. 34 At the festival of Tocalti, Tzocalticopa's image was dressed in new robes, and all the congregation wore new clothes.

Social control of dress. Dress expresses every social nuance, as well as every social grade. It also expresses family, municipal, provincial, regional, tribal, and national character. At the same time it gives full play to the individual. A complete psychology of the subject would analyze all such cases with reference to the principle of adaptation.

The least reducible of all distinctive costumes are the racial and the sexual. For instance, the

DRESS

Hindu fastens his jacket to the right; the Musal- 
mán to the left. In European dress the male 
style is to fasten buttons on the right, the fem
ele on the left. Where a division is central, the 
former still uses the buttons on the right hand, 
the latter, on the left, the respective garments 
thus folding over in opposite directions. The larger differences are 
no longer needed, and should be repeated.

A remarkable tendency is observable at the 
present day, which is due to increased facilities 
of travel and intercommunication, towards a cosmo-
politan type of dress, European in form.

The sense of solidarity distinguishing social 
individuals is sometimes expressed, as culture 
advances, in laws referring not only to the preser-
servation of social grades as such, but to their economic 
definitions. Various particular reasons which 
make for the adoption of a particular type of dress are 
the immediate inspiration of sumptuary laws in various 
races and nations. The sumptuary law proper is 
often combined with regulations of grade-fashion.

One of the earliest 'laws' of the kind is to be found in the 
laws of the Ancient Romans. The Koreans have strict 'sum-
porty' laws relating to dress. 'The actual design of the dress is the same,
but it is a matter of which it is used and its colour that are affected by it.
The lower and middle classes may wear none but garments of cotton or hemp;
while the nobility of position also have the white also of wearing violet, which is a sign of good birth or official

dom. The wearing of white at the court is usual, and the It was an enormous 
habit of the Austrian law, and two or more coats 
looking to the united. The shaws of these are large, like 
those of the Japanese kimono. The poor wear 
shoots in wet weather—people wear 
wooden clogs in shape like the French sabot.2 'Silk,' accord-
ng to Zoroastrian law, 'is good for the body, and cotton for the 
soul.' The former is derived from a 'noxious creature'; the 
latter acquires form from earth and water, and when personified 
are angels, part of their own sacralness.4 The Qur'an forbids 
men to wear silk or gold. The Prophet forbids, 
also the wearing of long trousers 'from pride.' 
His injunction was, 'Wear white clothes... and bury your dead in white 
clothes.'

The military Doric State passed laws against luxury in 
female dress. TheSolonian legislation apparently followed 
example. The lex Oppia of the Romans forbade, inter alia, the 
wear of women of a dress dyed in more than one colour, 
except at religious ceremonies. The Emperor Tiberius forbids 
the wearing of silk by the male sex. Philip the Fourth enacted 
a law against luxury in dress. The law of the Westminster 
Parliament of 1303 was concerned chiefly with regulating the 
fashion of dress of the social orders. The law passed in 
1463 'the same, as also, c. 5) regulated dress generally, on the lines of 
the Mercantile Theory of Economics, as had been the case, 
though less successfully, in the preceding Dutch and 
/oraly legislative. Luxury in dress (so the theory was applied) merely increased 
the wealth of other countries. A Scottish law of 1621 was the last of 
the kind.

It is natural that social resentment should follow 
breaks of the most characteristic of all social 
conventions. The mere fact of strangeness, when contrasted with the usual, 
is enough. Thus, in children and uncultivated persons, 
'style' may be aroused by the sight of a black skin or an 
oriental dress or the sounds of a strange language.'

In accordance with this essentially social instinct, 
the Latins denounced the wearing of 'strange gar-
ments' as a sin, adding that it 'raises doubts 
 among the multitudes.' The offence was punishable 
with death.

Various ideas of personal dignity are apt to be 
outraged by such breaches. Even in low cultures, 
carelessness in dress reflects upon both subject 
and object. Unless a Masai girl is well dressed accord-
ing to the dress of the chiefs, and who points herself with oil, 
she is not admitted into the 'chiefesses,' but is regarded as outcast.

In view of such social feeling, it is not surprising that

in countries like India there is no liberty of the subject as regards dress. Nor is there actually 
any more liberty in the matter for members of European 
or American societies. Decency, essentially a social instru-
ment, is difficult to contravene any unwritten law of dress is an 
offense against decency—in itself an adaptation to 
environment and state.

II. Invention of sexual dress. — The remarks 
of Franz may introduce this part of the subject, 
which is curiously large: 'The religions or super-
stitious interchanges of dress between men and 
women is an obscure and complex problem, and 
it is unlikely that any single solution would apply 
to all the cases.' He suggests that the custom of 
the bride dressing as a male might be a magical 
mode of ensuring a male heir, and that the wear-
ing by the wife of her husband's garments might 
be a magical mode of transferring her pains to the 
man.2 The latter mode would thus be the converse of 
the former. We may also note the import-
ance assigned to the principle of transference or 
conjunction. Such ideas, if they are true, are 
perhaps secondary, the conscious reactions to an 
unconscious impulsive action, whose motivation 
may be entirely different. The whole subject falls 
simply into two classes, the male and the female, 
as they come. The Zulu 'Black Ox Sacrifices' pro-
duces rain. The officiants, chief men, wear 
the girdles of young girls for the occasion.

To produce a change in nature, it is necessary for 
the chief himself to take on the species of 
human being that one requires, but its 
meaning is adaptation. Its reverse aspect is a 
change of luck by a change of self. The most 
obvious change is change of sex, the sexual demar-
cation being the strongest known to society, divi-

ing it into two halves. The following shows this 
more clearly:

In order to avert disease from their cattle, the Zulus perform 
the undula. This is the custom of allowing the girls to herd 
the oxen for a day. All the young women rise early, dress 
themselves entirely in their brothers' clothes, and, taking 
their brothers' knickers and socks, open the cattle-pen and drive 
the cattle to pasture, returning at sunset. No one of the male 
sex may go near them or speak to them meanwhile.4 Here 
a change of officiants, socially different, produces a change 
of luck and of nature. Similarly, among the old Arabs, a man 
being stung by a scorpion would try the cure of wearing a woman's 
bracelets and ear-rings.3 In Central Australia a man will cure 
his headaches by his heavy bones of his late child, 
and all evil influences may enter into them instead of into the child.3

In the last case the dress itself acts as a warning notice, repre-
sentative of the father's person.

In the following is to be seen the principle of impersonation, 
the reverse method of change of personality, 
combined, double, no doubt, with an impulsive 
sympathetic reaction, equivalent to a desire to share 
the person of another.

In Southern India the wandering Eulkavalavandi 
have this custom—directly the woman feels the breath 
of the dead, she takes off her dress, and clothes herself 
in her husband's, immediately takes on the dress of the dead, and when 
she is alone in a river, she raises him up with a long cloak.4 In Thuringia the man's shirt is 
hung before the window. In South Germany and Hungary 
the father's name is worn by the child, at least in certain 
public places. In Königsberg a mother puts her clothes over the child, to pres-

DRESS

vent the evil Druid carrying it off, and to dress a child in its tassets. If the child is sick the medicine-man puts a piece of his own auletta garment upon it. In Silesia a sick child is wrapped in its mother's shawl. A Hindu mother, in some parts of Germany it is unlucky to wrap a boy in his mother's dress.

In other cases, secondary ideas are clearly present. In particular, the influence of a person's dress, as part of or impregnated with his personality, is to be seen.

A holiday being a suspension of normal life, it tends to be accompanied by every kind of reversal of the usual order. Commonly all laws and customs are broken. An obvious mode of reversal is the adoption of the garments of the other sex.

In the middle ages, women wore the clothes of men or women. In Carnival festivities men have dressed up as women, and women as men. In the Argive Ypsiades festival men wore women's robes and veils, and women dressed as men. At the Saturnalia, slaves exchanged positions and dress with their masters, and men with women. In Asia, as elsewhere at vintage festivals and the like, men and women exchange the dress of their sex. In the medieval festes of Purim, the Jewish Bucharanese, men dressed as women, and women as men. The result, and in some degree the motive, of such interchange is purely social, expressive of the desire for good-fellowship and union.

Numerous cases fall under the heading of symptomatic assimilation. Magical results may be combined with an instinctive adaptation, or may follow it.

In Korea, soldiers' wives 'are compelled to wear their husbands' green regimental coats over their heads like headscarves. The object is to be sure that the farmers should have their coats in good order, in case of war.' Some women are encouraged to wear green coats, but the custom is still observed. The explanation is obviously post facto. It seems more probable that the fashion came from the Emirates and that the women wore their husbands' or lovers' colours. Every autumn the Nunges of Assam celebrate a festival in honour of all children born during the year. During this, men disguised as women or as members of a neighbouring tribe visit all the mothers and dance in return for presents. In the Harvey Islands a widow wears the dress of her dead husband. A widower may be seen walking about with a dead woman's head, 'Instead of her shoe, a mother will wear on her back a pair of trousers belonging to a little son just laid in his grave.' In Timor, widows and widowers wear a piece of the clothing of the dead in the hair. The custom is very frequent at tugatur ceremonies and at marriage festivities.

The bride's polos, connected with the puberty of her girls, Basuto women 'acted like mad people. They went about performing curious mummeries, wearing men's clothes, and crying out and making so very noisy a sound that they met.' The Basutu boy is termed sipolo at his circumcision. When the women wear the men's garments and wear the men's ornaments, they appear as women and wear the men's ornaments and long garment reaching to the ground, worn by married women. When the woman is healed they don the warrior's costume and are regarded as men. Even when the hair has grown long enough to plait they are styled a-moror, or warlocks. When an Egyptian boy is circumcised, at the age of 5 or 6, he parades the streets, dressed as a girl in female clothes and ornaments borrowed for the occasion. A friend lays in front, and a friend rocks the boy's own writing-table. To assert the evil eye a woman sprinkles salt behind. In the old Greek story the boy Ascon lived in Syros as a girl, dressed as a girl, to avoid being sent against Troy. He bore a maiden name, Isia or Pyrrha.

In such cases we may see, at the initiation to the sexual life and state, an adaptation to it in the form of an assimilation to the other sex.

The principle of symptomatic assimilation is clearly brought out in the following two examples:

At the ceremonial burying of the placenta, Babar women who officially declare that the child is a boy, but women's

same age if a girl. At the festival celebrating a birth, Fijian men paint on the bodies of the infants. If a child is sick the medicine-man puts a piece of his own auletta garment upon it. In Silesia a sick child is wrapped in its mother's shawl. A Hindu mother, in some parts of Germany it is unlucky to wrap a boy in his mother's dress.

In other cases the data are insufficient for an explanation.

Thus, at harvest ceremonies in Bavaria, the officiating reaper is dressed in women's clothes; or, for the office, she is dressed as a man. At the vernal festival of Hercules at Rome men dressed as women. The choir at the Athenian Odeon is always led by two women. Cases occur of change of sex dress by way of disguise; it is more frequent in civilization than in barbarism.

A Bangala man troubled by a bad mongol, evil spirit, left his house secretly. 'He donned a woman's dress and assumed a female voice, and went to the forest, and, in order to deceive the mongol, he failed to cut his hair and in time he returned to his town, but continued to act as a woman.'

The last of these may suggest a process of assimilation of modern cases that suggest that a congenital tendency towards some form of inversion is present in such cases. On the face of them, we have to account for the choice of a sexual change of dress.

A Kolla homicide wears special ornaments and is tattooed. The latter practice is otherwise limited to the female sex. Women's dress may involve the assumption of women's weakness and similar properties.

The king of Burena suggested to the king of Aracae to dress his soldiers as women. They consequently became effeminate and weak.

The Lycians, when in mourning, dressed as women. Pintarch explains this rationally, as a way of showing that mourning is effeminate, that it is womanly and weak to mourn. For women are more prone to mourning than are men, barbarians than Greeks, and inferior persons than superior. If the document is genuine, we may apply to the Lycians the principle adopted in regard to mourning costume generally. The state of mourning is an absolute suspension, and it may come to be regarded as an absolute reversal or inversion of the normal state of life.

Death, the negative of life, has taken place and made a violent break with the tenor of existence; hence such an adaptation as an inversion of sex dress. Occasions might well be conceived when, if change of attire was desired, the only obvious attire presenting itself would be that of the other sex.

One of the most complex cases at first appearance, is that of the adoption of feminine dress by priests, shamans, and medicine-men. Where for various mythological reasons an androgynous deity

exists, it is natural that the attendant priests should be sympathetically made two-sexed in their garb, and even that the worshippers should invert their dress. Sacrifice was made to the Bearded Venus of Cyprus by men dressed as women, and by women as men. As a rule, however, the deity is an invention intended, unconsciously enough, to harmonize with a traditional habit of priestly life; as a matter of practice, it leads to inversion, and involves a whole genus of phantasies. Some examples may precede analysis:

Chukchi shamans commonly dress as women. The hair of the Dayaks make their living by witchcraft, and are dressed as women. The priestesses, batukta, of the Dayaks dressed as women. Sometimes a Dayak priest marries simultaneously a man and a woman, both the northern Asiatic peoples and the Dayaks it frequently happens that a double inversion takes place, so that of the witchcraft business. A woman is a man and a woman is a man; it is said by the Koryaks that shamans who had changed their sex were very powerful. The Illi-Balkasian Indian regarded such men as had 'changed their sex' as unusual or supernaturally gifted persons. But it is unnecessary to assume that the priestess is intended to acquire special magical powers attributed to women. This idea may survive. Possibly the fantastic nature of the change was more than change, that had had some influence. Patagonian sorcerers, chosen from children afflicted with St. Vitus's Dance, were among the Indians of Louisiana dressed as women. In the Belcher Islands a remarkable change was observed, a goddess often takes places of a man, instead of a woman, to her mouthpiece. In such cases the man, dressed as a woman, was regarded and treated as a woman, and this signifies that this is in connection with the olden social system. Frazer regards this invention by the same spirit as explaining other cases when sex is exchanged in triadic priesthoods of the Dayaks, Bugis, Patagonians, Ainus, and other Indian tribes. It is stated of some North American cases in the last thirty years, that the dress was inspired by a female spirit, and that her 'medicine' was to live as a woman. In Uganda Sukusu goddesses pass through a phase, to which they wear a dress which they happen to wear long hair, and to be headdresses in the masculine style. The legends of Sardanapalus (Assur-Bani-pal) and Heracles, as was the case in every conqueror, was also as a woman, and the story of the sack of Troy where in these a woman was treated as a woman. And it is probable that these goddesses of unconsciousness, priests, who were priest-gods. Dionysus Pseudos is a similar embodiment of the principle.

Emucah in India are sometimes dedicated to the goddess Durga, and wear female clothes as men who believe themselves to be impotent serve this goddess, and dress as women to escape their virility. A festival was given among the Sioux Indians to a man dressed and living as a woman, but not of this class. The dress was inspired by a female spirit, and that the 'medicine' was to live as a woman. In Uganda Sukusu goddesses pass through a phase, to which they were accustomed, and the feast is given to him annually. Among the iron-workers of Manipur, the god Khumlangaha is supposed to appear in a little fellow, a man is sometimes taken possession of by the god. He is then known as man, and women as woman. The dress of the man is changed to that of the woman, the body from below the arms, the white jacket, and a dhoti. A fine muslin veil covers the head. Superior to the man, by reason of her connexion with the god, and therefore if a man is honoured in the same way he assumes the dress of the spirits as an honour. If a man marries a wife, he sleeps on the right of her, whereas the ordinary place of a man is the right, as being the inferior side. It appears that women are more liable to be possessed by the god, and the same may be observed among all the hill tribes of these parts. The oganos, medicine-men, of the Bangals, in certain ceremonies after a death, for the purpose of discovering the Slayer dress up as women. Off-duty of the Arooan there were 'conjurers' who were dressed and lived as women. On the

Congo a priest dressed as a woman and was called Grandmother, or the Nalavansans, who of ancient Germany, had a priest dressed as a woman. Men of the Valishia sect win the favour of Ksya by wearing their hair long and generally assimilating themselves to the men. The practice is even followed by their women. Candidates for the shroi society of Tahiti were invested with the dress of women.

There is no doubt that these phenomena are cases of sexual inversion, congenital or acquired, partial or complete. Any idea of inspiration by female deities or the reverse is quite foreign to the notion of assimilation of priest to goddess, or of marriage of a priest to a god. The significant fact is that throughout history the priesthood has had a tendency towards effemination. The discussion of this belongs elsewhere.

Sexual inversion has especially obtained among the connected races of North Asia and America. It is marked by inversion of dress.

In nearly every part of the country [of America] there seem to have been, since ancient times, men dressing themselves in the clothes and performing the actions of women. Thus the custom for parents who had a girl-like sex to dress and rear him as a girl, teaching him only domestic duties, keeping him at woman's work, and letting him associate only with women and girls. A Chukchi boy at the age of sixteen will often relinquish his sex. He adopts a woman's dress, and lets his hair grow. It frequently happens that in such cases the husband is a woman and the wife a man. These abnormal changes are often brought about by the shamans, who interpret such cases as an injunction of their individual deity. A similar practice is found among the Koryaks.

Among the Zambos there were men dressed as women. So among the Luwara of ancient Germany, a priest sometimes became a woman. When asked the reason, a woman so changed said stalking an ogano was not good, and so they became a man. In Tahiti there were men, called men, who assumed 'the dress, attitude, and manners of women. If the Malagasy, the men called fannina, wore the dress. The women of South-West (German) Africa, and the Diakite-Sarrasac of the French Sudan, dressed in the same way on days of public importance. Langsdorff wrote: 'Boys, in order to be very handsome, are often brought up entirely in the manner of girls, and instructed in the arts women. They pluck out as soon as they begin to appear, and their chins are shaved off; as they do of the women's.'

Dodd has studied the custom of not man, not woman' or turtuk (half man, half woman) was found frequently among the forest inhabitants. These men, and became a girl, which he has since followed. The turtuk-u-muy, man-woman, of the Indians of California and Arizona, are regarded as regular social beings. Dress as women, they performed women's tasks. "When an Indian shows a desire to shirk his manly duties, they make him take his position in a circle of fire; then a bow and a woman-stick are offered to him, and he is solemnly enjoined . . . to choose which he will, and afterward to abide by his choice." Something analogous is recorded of the ancient Scythians and the occurrence of a phallic rooster among the Thuringians. Some of the above cases, difficult to disentangle accurately, are not so much cases of congenital inversion as of general physical weakness. It is a

remarkable aspect of certain types of barbarous society that the weak males are forced into the grade of women, and made to assume female dress and duties. Such a practice may, of course, induce some amount of acquired inversion. Payne has suggested that the survival was due to advancement in civilization, and that later they formed a nucleus for the slave-class.

The occurrence of a masculine temperament in women is not uncommon in early culture. In some tribes of Brazil there were women who dressed and lived as men, hunting and going to war. The same practice is found in Zanzibar and among the Eastern Eskimo. Shilings, who became queen of Congo in 1640, kept 50 or 60 male concubines. She always dressed as a man, and compelled them to take the names and dress of women. Classical antiquity has many similar cases of queens wearing men's armour in war, and of women fighting in the ranks, either temporarily, or permanently, as the Amazons. The last case, as the analogy of the West African cases of women's regiments, may be based on fact.

In civilization the practice of women dressing as men and following masculine vocations is no less frequent than that in barbarism the custom of effemination of men. Women of masculine appearance are a phenomenon to-day, and the balance of sexual reversal has thus changed.

There remain to be considered two classes who form more or less definite social grades, and in some cases are distinguished by dress. These are old men and women. After the menopause, women, as the Zulus say, 'become men,' and the customs of bontwe, or sexual tabu, do not apply to them any longer. Often, instead of the dress of matronage or savage and barbarous women after the menopause dress as men. For instance, in Uripiv (New Hebrides) an old widow of a chief lived independently, and at the dances painted her face like a man and danced with the best of them. Often they engage in war, consult with the old men, as well as having great influence over their own sex.

Various enactments both in semi-civilized custom and in civilized law have been made against inversion of dress. A typical decision is that of the Council of Gangra (A.D. 370): 'If any woman, under pretence of leading an ascetic life, change her apparel, and insist on the accustomed habit of men, let her be anathema.' The point is noticeable that asceticism here, in the absence of a neutral garb, has recourse to the male dress. Such enactments and the modern laws on the subject are based on the Heb. law (Lev. 19:29) and the Christian of I Co 11, but they embody a scientifically sound principle.

12. Exchange of dress.—This custom is frequent between friends, varers, betrothed, and as a marriage rite. It is analogous to an exchange of any objects serving as mutual gifts, and as ultimate origin is to be found in this natural and obvious practice. Originally, therefore, it is outside the sphere of the psychology of dress proper; but it at once assumes various ideas of dress, often in an intensified form.

In Homer's story Glansus and Bloned exchanged armour and became brothers-in-arms. Among the Khasias an exchange of clothes 'gives birth to or is a sign of unity.' In Ambayna and Yatar and other islands, lovers exchange clothes in order, as it is reported, to have the colour of the beloved person with them. In Eastern folklore it is a very frequent theme that bride and bridegroom exchange head-dress. The Ann youth and girl after formal wear each other's clothing. In South Celebes the bridegroom at a certain stage of the ceremonies puts on the garments which the bride has put on. Among the Macaol Jews they lift a custom of the bride wearing a helmet and sword, and the groom a female dress. At a Brahmin marriage in South India the bridegroom is dressed as a boy, and another girl is dressed to represent the bride.

The secondary idea which is prominent in these customs is that of union between men of a neutral assimilation. This is shown by such cases as the following:

In Bursa a family quarrel is terminated by a feast. The father of the injured woman puts on the shoulders of his husband some of his own family's clothes; the husband puts on him a cloth he has brought for the purpose. Among the Masaín murder may be 'arranged' and peace made between the two families by the office of the elders. The family of the murdered man's wife, and the latter (the family of the murderer) takes the garment of one of the dead man's brothers.

A later stage of development is marked by ideas of contagion of ill-will, or of the conditional curse. By way of making a guarantee of peace, Brahmin tribes wore a wreath of green leaves furnished by the bride and groom, and a cord of cloth manufactured in common, and offered both to the gods, with curses on the murderer of the taker of the cord. To establish that contact with a person which serves as a 'conductor' of conditional curses, in the Moorish institution of Etr, it is enough to touch him with the thread. Though the above statement may be a case of indigility by mutilation of garments, but a magical act of invocating liberty. When Hamburger, south of Asia, in south off the half, and half the clothes of David's ambassadors when they sent them back, he wanted a guarantee of friendly relations. His wife, Franzi observed him, and immediately made a vow to provide spells over these personal guarantees while David was on his way.

Similarly, possession or contact ensures sympathy, whether by mere union or by the threat of injury. In the Muncaver islands, "If a stranger enters a house where children are, the father or some member of the household takes the ornament with which the children decorate their hair, and hands it to the stranger, who holds it for a while and then return it. The procedure protects the children from the possibly evil eye of the visitor.

Union in marriage and the like is commonly effected by enveloping the pair in one robe, or by joining their garments together.

In South Celebes the ceremony of radda ampu consists in enveloping them in one sarong, which the priest casts over them like a coat. The Taliabsans and the Ilovas of Madagascar have the same custom. The Dayak Beloam throws one cloth over the pair. Among the Toba-Batak the mother places a garment over the bride. A similar ceremony among the Ndorh of Dorch is explained as a symbol of the marriage 'tie.' In north Nias the pair are enveloped in one garment. Among the South Celebes the bridegroom meets with a girl before puberty covers her and himself with one mantie. The Hindoos bind the new-born in both men and women, and the Brahman knot. It is the same knot as that is used in the sacred thread. The tying is repeated at various points in the ceremonies. The hudi, or apays, or tied ornament, is worn on the forehead. It is a European waist sash, and is of the kind of ornament. The bride and groom both don wedding clothes during the ceremonies. The Bihillas tie the garments of the bride and groom together. Previously to the ceremony of radda ampu the clothes of the Celebes pair are sewn together—the rite of radda-karri, or radda, or paracki.
In connexion with marriage the custom is hardly intended to unite the woman to the man's family and that of her husband's. More probably it merely assimilates the two individuals; while, from the social point of view, it unites their respective sexual grades.

It is remarkable that many ceremonies of initiation, particularly those in which a spiritual fatherhood and sonship is established, are analogous in method to a marriage rite. Thus the guru of the Deccan Mahars, when initiating a child, covers the nude child for some time with one hand.2

Cases where the rite has one side only are natural, but are apt to take on the character of an act of acquisition and possession. In the Sandwich Islands the bridegroom puts a piece of grass over the bride, this constituting marriage.4 In this it is analogous to the Hindus giving cloth.5 In Arabian times to cast a garment over a woman was to claim her. This explains the words of Ruth (Iv 9). In Mal 3:4 'garment' is equivalent to 'wife'.6 A similar idea obtains in other circumstances, the dress having the force of a personal representative. The Southern Masai have a custom that a woman may never again live alone, but must be taken to some man's kraal5 if she throws her dirinya, grass-petticoat, over him.6

LITERATURE.—This is fully given in the footnotes.

A. E. CRAWLEY.

DRINKS, DRINKING.—The sensation of thirst is a physiological correlate of the metabolic function of the water of life. In effect importance drink comes next to air and before food. Thus in social psychology drink has played a more important part than food, especially since the primitive discoverers of fermentation and distillation made alcohol a constituent of drinkables. After being weaned from his mother's milk—a drink which is also a complete food—man finds a 'natural' drink in water. But, as experimentation in food-material proceeded, the sensation of thirst was supplemented by the sense of taste. The resulting complex 'sense of drink' was satisfied by a series of discoveries which gave to drinkables certain properties both of food and of drugs. Before they were corrupted by European spirit, the Eskimo drank chiefly cold water, which they kept in wooden tubs outside their houses.3 But on occasion they boiled the hot blood and melted fat. An observer states of the New Hebrides: '1 cup, like drinks made from the fruits and the sun of trees, acquire an intoxicating quality by fermentation. In most parts of the Old and the New World the produce of cereals and fruits, and the early palaces largely consumed in the manufacture of some species of beer ... the early civilized drank it to excess.8

1. Fermented drinks.—(a) Beer.—It is impossible to trace with precision the order of discovery and invention. Probably one of the earliest steps was the use and storage of fruit juices. The practice of storage would lead to the discovery of fermentation. The use of corn for the preparation of fermented liquor is perhaps almost as early as its use for food. Cereal agriculture itself

1 As Van Geenup holds (p. 246). On the whole subject of exchange of drugs, see similarly Marion, Malaria, 882, 892, 902, pavia; and for marriage, G. A. Wilken, in Bijdragen tot de Taal-, Land- en Volkenkunde, 21 (1915), xxvii. (1910) 38–400 ff.

The use of malted grain is probably later than the simpler principle of infusion. The term 'beer' is generally applied to the drinkable products of both. In the majority of early beers, such as the Mexican and Peruvian chicha, infusion only is used.

In Eastern Asia an intoxicant made from rice is very general. Orgys gluttons is frequently used for it The manufacture among the Dayaks is as follows:

The rice is boiled, placed in pots with yeast, rasp. This stands for some days exposed to the sun. Then water is added, and the mixture is allowed to ferment for two days. It is then strained through gauze. This drink is the basis of the Dayaks, the tapis of the Malays, the boody of Java. A similar drink is made by the Buginese and Makassar, called brom. These drinks are extremely intoxicating. The rice-beer, zu, of the Naga is said to be soporific rather than intoxicating.2 This is also largely the case with barley-beers in all their varieties. 'The liquor which plays so important a part in the daily life of the Garo is always brewed and never distilled. It may be prepared from rice, millet, maize, or Job's tears: 3 Many aboriginal tribes of India drink rice-beer. The term sankee, or samee, in China includes rice-beer. Sked or sak, the national drink of the Japanese, is made from the best rice-grains by fermentation. It has a slightly acid taste, and is of the colour of pale sherry. Inferior varieties are shiro-zake (white sak), and a muddy sort, niori-zake. There is a sweet variety, called kuro-zake or black sak. 

Beer made from varieties of millet (Andropogon sorgum vulgaris) is the chief African drink. Its use extends from the Kaffirs to the Egyptians. Under the name of pombe it is familiar throughout Central Africa. In Egypt it is the drink of the poor and the peasant. Besides durra-beer, the Nubians and Abyssinians make a sour beer from oats.6

Where barley is the staple grain for beer manufacture, rice is sometimes used to make a coarser variety. Wheat is occasionally used. In Germany it was once largely employed in what was known as Weissbier.

A grain as important regionally as rice and millet for the manufacture of beer is maize (Zea maiz). Occasionally used in the Old World, as in parts of Africa, it is the staple grain for beer in America, its use extending from the Chaco Indians to the Apaches in the North. The latter made much use of it in their ceremonial life. They called it tawin, and flavoured it with various spices.7 The Southern and Central America maize-beer is known as chicha—a name familiar as is pombe in Africa.

The fermented liquor, chicha, is an infusion of cooked maize in water. This is allowed to ferment. Its use was universal throughout ancient times, such as Peru and China.4 With other ingredients was a particularly strong intoxicant, used only at the hunt, for instance. Today the Indians of the Amazon, mix in wild fruits, brew very excellent chichas, flavouring it with the young shoots of a plant which has the effects of an opiate.8

In Mediterranean and north European culture, barley has been the staple of beer. The ancient Egyptians made a beer, zythum, from barley. Discorides mentions gueus, sipois, and shews as being used in the Greek world. The Hebrews seem to have included beer in the term shabbir (IV strong drink). Spanish beer (ceiba or cerveza), Gallic beer (cervoise), and an infant beer were known to the Romans.9 Germany and England have always been famous for their beers, and in modern times their output is the most important. Here there was an old distinction between stie (beer without hops) and beer (the hopped liquor). Climate and water, as in the case of wine, have much to do with the production of varieties. English beer is quite a distinct variety from either the light or the dark beer of the Continent. The Russian area is the home of barley and rye, or of rye alone.

The geographical range of beer, as of rice, maize, and millet, as well as barley and rye-beer,

under the term, is precisely that of the respective cereals, covering the globe, except the Arctic and Antarctic parallels, and a narrow belt where the vine grows. In this belt, wine has always had a precedence over beer and spirits, and it is not a luxury. In northern Europe, beer is more or less a ‘national’ drink, and everywhere it is a companion to fish. It has not the bitter character of ‘wine’ as opposed to wine that it has greater power of refreshment. Improved methods of storage have increased this since the time when beer had to be drunk before it fermented.

(b) Wines.—There is no reason why the term ‘wine’ should not be included to the many varieties of liquor made by savage and semi-civilized races from the sap of trees. The (Continued page 74)

Drinks, Drinking

Drinks (or beverages) are a large and varied group of substances. Some are made from plants and others from animals. They include tea, coffee, milk, beer, wine, and spirits. All of these are enjoyed by people around the world, but their popularity varies depending on cultural and regional factors.

1. Tea: Tea is one of the most popular drinks in the world. It is made from the leaves of tea plants and can be enjoyed hot or cold. China and India are the largest producers of tea, but it is also grown in other countries such as Kenya, Tanzania, and Sri Lanka.
2. Coffee: Coffee is another popular drink that is enjoyed by many people around the world. It is made from the beans of the coffee plant and can be enjoyed hot or cold. Brazil is the largest producer of coffee, but it is also grown in other countries such as Ethiopia, Colombia, and Vietnam.
3. Milk: Milk is a nutritious beverage that is enjoyed by people of all ages. It is made from the milk of cows, goats, sheep, and other animals. Milk is used in many different ways, such as in soups, cereals, and desserts.
4. Beer: Beer is a fermented alcoholic beverage that is made from grains such as barley, wheat, and rye. It is enjoyed by many people around the world and is produced in a variety of styles and flavors.
5. Wine: Wine is a fermented alcoholic beverage that is made from the juice of grapes. It is enjoyed by many people around the world and is produced in a variety of styles and flavors.
6. Spirits: Spirits are alcoholic beverages that are distilled from a variety of plants and grains. They include vodka, gin, tequila, and rum, among others.

These beverages are enjoyed in many different ways and for various reasons, such as for their taste, for their health benefits, or as a way to celebrate special occasions. They are an important part of many cultures and are enjoyed by people around the world.
Portugal and Spain produce a true brandy, known as aguardiente. Brandy proper is chiefly made in France, and there the beverage was introduced to Europe by the Spaniards.

The Mexican cocoa was prepared by mixing the cocoa-seed into a paste with maras. Diluted with hot water, and churned into a thick froth, which was the actual beverage, it was drunk when cold only, except in the time of drinking hot. Vanilla was usually added as a flavouring. Chocolate, as the drink drunk by the ancient Mexicans, was a careful union both to its aroma and to its fatty constituents. It was known to be a nervous stimulant. In modern times the fat is removed by the screw-press; this and the addition of sugar render it more palatable. Benzoni (1619-1669) describes it as a drink more agreeable to pigs than for human consumption, and named it Thoebroma ("food of the gods"). Thoebroma cacao. It contains the same powerful alkaloid as the cola-nut. As a beverage in Western civilisation it is only less important than coffee and tea.

4. Other drinks.—Drinks prepared from roots are not numerous, but of these the most important are the tubers. S. Though referred to; others are the kava of Polynesia, the paievar of Guiana, and the mishka of the Mosquitos. The root of the sweet potato (Batatas edulis) is occasionally used. Paievar and mishka are made from this root, and kava is used threatening, from the Mamitl utilissima, which in another form is the tapiooca of commerce.

With mishka we approach a class of drinks which become more and more generally social both in the East and in the West, and in use. One noteworthy detail reflects the characteristics of communal life, and also illustrates the stage of culture in which the preparation of commodities is ad hoc, and storage and artificial production are at a minimum. This is the fact that the communal drink is prepared only for special feasts, which are, however, frequent, and is all consumed.

The mishka of the Mosquito region includes all kinds of strong drink, but particularly that prepared from cassava, manioc. The famous kases of Polynesia and Melanesia is in many regions becoming obsolete, and is superseded by European drinks. The soma of the ancient Indians, and the identical Aasana of the ancient Persians, are the most ancient examples of the communal drink becoming religious, and being apotheosised. Amyra, the nectar conferring immortality, was produced, along with this beverage, as an offering from the churning of the milky ocean. It was, however, an unguent rather than a drink (see Ambrosia (Hindu)). The Hisoric ambrosia was the food of immortality; the nectar was the drink of the gods. Sapappa and Anacardiates speak of ambrosia as a drink; it is also employed as an unguent like the Velic amanda. Alcan speaks of nectar as a food. Later, it was a synonym for wine; and acquired the special connotation of fragrance. The Hisoric nectar conferred immortality; hence it was forbidden to men. It was described as epiphloge, and, like Greek wine, was mixed with water or pomegranate and egg, and the root of estragon meaning its name is the same as that of ambrosia.

5. Tendencies of evolution.—The evolution of taste is perhaps not altogether a sociological, but partly an ontological, phenomenon. It is a function of the evolution of manufacture. One or two tendencies may be observed. For example, man's drinks tend to the condition of water. Thus, many beverages of primitive peoples are prepared in a thick soup-like form. Chocolate, for example, was drunk very thick. In Tibet and many Mongol districts tea is prepared with butter. Turkish coffee is characterized by the inclusion of grounds. English beer has passed from a unruled to a sparkling clearness. The thick sweet character of pulque resembles the insinuated must of Greco-Roman wine production. The ancient wine of India, in its origin, was not only very thick, almost of the consistency of treacle, and probably for that reason it was generally drunk diluted with water. The sparkling nature of the best wines has during the last century been suggested both in their origin and in water by the method of effervescence. First applied to the wines of Champagne, it was adopted for certain of the Rhine

Medieval Europe was rich in the lore of making cordials and essences. To the earliest period of the Middle Ages belong the terms aqua viva and elixir vitae. The discovery of alchemy for elixirs of life and youth probably gave some impetus to industrial invention.

Civilized taste has declared against the fermented drinks included in the term "mead," fermented liquors made from honey have been largely used from the earliest barbarism. The Bogos and Abyssinians make a variety of mead. What is commonly styled honey beer is often merely a sweet fermented liquor, but true honey wine is reported for the Hottentots, Feloops, and A-kambu. Certain peoples have made fermented liquors from succulence substances produced from plants.

Such are recorded for ancient Syria, made from wine and palm wine. In Yucatan a fermented liquor was made from honey, fermented from that obtained by boiling the berries of Schinus molle. Honey beer, madaka (Gr. melo), whatever its nature, is recorded for ancient India. It is said to have been superceded by soma.

3. Infusions.—Tea, coffee, and cocoa are stimulants, without the specific effects of alcoholic drinks. Their properties are due respectively to the alkaloids thein, caffeine, and theobromin. The use of these infusions and decoctions has increased enormously in modern times. It is significant that China has been the chief additio, to the use of alcoholic liquor, and that coffee is chiefly grown in Muhammadan countries. Ancient Mexico seems to have had a hard struggle against the national abuse of intoxicants, and its successful crusade was largely due to the presence of cocoa.

The tea-plant (Thea chinensis) is a native of China and Assam. Its cultivation in India and Ceylon is only very recent, but has assumed enormous proportions, chiefly in N.E. India and Assam, and S. China.

Used for centuries in Russia, which derived good tea from China since its connexion with the East, tea is now drunk practically all over the world. Even a people like the savages of the New Hebrides are fond of tea, coffee, and cocoa, provided it be sweetened with sugar. But the Polynesian natives still prefer the milk of the cocoa-nut. The distinction between the uses of cocoa and coffee was at a period when the tea was not yet known. The use of tea among European peoples is relatively recent, while for China it has been traced back to the beginning of the third millennium B.C.

Tradition assigns the discovery of coffee to Abyssinia. It was introduced into Arabia in the 15th cent., and into Turkey in the 16th. In the 17th cent. its use gained a footing in England and France. The coffee of the New World, deriving from one plant sent to Surinam from Amsterdam in 1718, is now the largest production, Brazil supplying the greater part. Arabia, North Africa, and the East Indies are the other great coffee regions. It is grown also in Southern India.

The best Arabian coffee is grown in Yemen. Besides the infusion, there is a drink, which is prepared from the leaves. The green shoots are dried in the sun, and then roasted and powdered. The resultant beverage is the kahwa of Yemen, the fezun dope of Java, and the kahwah of Sumatra. The Arabs are regarded as being superior to that of ordinary coffee in qualities.

The tree from which cocoa and chocolate are made is indigenous to Central and South America. It was cultivated by the Mexicans, and from them the beverage was introduced to Europe by the Spaniards.
vintages. The production of artificial mineral waters, in which many acids of carboxylic acid groups cause sparkling, is characteristic of the last half-century. One result of fermentation is thus obtained, without, in the case of mineral waters, any fermentation at all.

Avidity for milk is towards the reduction of sweetness. Old wines in which no sugar is left have been preferred in recent centuries. Such, however, have a corresponding excess of alcohol. Dryness in modern wines is increasing, by somewhat after-taste. sweater drinks, like mead and malmsey, are typical in barbarism, and in ancient and medieval culture. Malmsey, the French malvoisie, was originally a Greek wine, and carried on the tradition of the Greek red wine. The Greeks themselves corrected sweetness by various methods, among them being the use of salt water. Savagery and barbarism had no lack of experiments in the production of varied flavours, if not of the correctness of sweetness.

The rice-beer of the Nagas is flavoured with Jungle berries, such as Datun, 2 while the neighbouring peasantry dilute theirs with water. 3 The natives of the Moluccas correct the sweetness of their soppa by adding barks of a latter flavour. The addition of certain spices, particularly cloves and nutmegs, is a refreshing character. In old English life spiced were largely used in both ale and beer and drinks were taken 

A similar tendency, found very early in culture, is to be noted in the preference for sour milk.

6. Animal drinks. — Drinks, other than milk and blood, produced from animal substance, are less common, and nor mérely wine or beers, but actual beverages. The credit of the invention and use of the only animal spirit known to the world belongs to the Tatar tribes of Asia. Their koumiss, distilled from the milk of their mares, has been known since Greek times.

Human milk is the natural food of the human infant. Though differing in some important respects, the milk yielded by various animals is a satisfactory food for children, especially in its products, a valuable food for adults. The use of milk-animals was a great step towards civilization.

When Dayaks kill a pig or an ox, which is done to music and singing, they scramble for the blood. Men, women, and children drink of it; they smear themselves all over with it, and behave like wild beasts, carrying their faces in the bleeding carcases. 6 Blood, in fact, is to the savage 'a perfectly natural food'; certainly, perhaps, that milk, which is nothing but blood filtered through a gland. 7

7. Drinking customs and ideas. — The natural care bestowed upon the preparation of drinkable is greatly developed by growing intelligence, and inspired at certain stages of culture by religious emotion.

'The Hindu is very particular as to the water he drinks. It must be ceremonially pure, though not necessarily chemically pure.' It has to be very carefully fetched. If the carrier leaves or comes near an out-caste or anything impure, the water is thrown away, and the vessel broken, or scorched with sand and water. 8 The kings of ancient Persia had their drinking water brought from particular rivers, especially the Zab. 9 Water, in Zoroastrianism, is sacred. It is a 'dress for breath,' physiologically and physically. It is a sin to drink water in the dark, or to pour it away. Water is the 'dark spirit'; for sacrifice it is more valuable than spirituous liquors. 10

A good deal of myth has gathered about the palm-wine tree (Arecos saccharifera) in the East Indies. Many stories are told of how the juice of the nut has brought the dead to life again. 11 The Dayaks of South-East Borneo

figure palm-wine as milk, flowing from the tree as if from a woman. 12 The Nairs hold that a palm-tree planted by a woman yields more sap than one planted by a man. A folk-tale runs that a woman was sent to deliver a message, and not wishing her baby to starve, cut off one of her breasts. Out of this grew the palm-wine tree. 13 In Angkola a woman prayed to be turned into a palm-tree. When she died, the Angunca tree cut itself from her navel, the opium plant from her forehead, the piasang from her feet, and the pocal from her breasts. 14

Besides the stimulating and expansive properties of wine and spirits, the process of fermentation has naturally engaged the popular mind. A good deal of superstition is, no doubt, to be referred to speculation upon the necessities of human life.

Among the Masai, 15 when honey-wine is to be brewed, a man and a woman are selected for the purpose, neither of whom has had sexual intercourse for two days. A tent is set apart for them to live in until the honey-wine is ready for drinking (six days), during which time they may not sleep together. A man is believed to use honey-wine in brewing, it is believed that the wine would be undrinkable, and the bees that made the honey would fly away. 6

The ultimate reason for such a rule is probably merely an unconscious impulse towards concentration of purpose and avoidance of anything that might divert attention. The participation is particularly delicate. From the original impulse would develop ideas about the danger of mixing interests, no less than material; and, later on, ideas of sympathetic influence, among which may perhaps be seen some comparison of sexual function with the process of fermentation.

In old Mexico the men who prepared pulque wist not touch women for twenty days after any impurities or broths, or but actual beverages. The credit of the invention and use of the only animal spirit known to the world belongs to the Tatar tribes of Asia. Their koumiss, distilled from the milk of their mares, has been known since Greek times.

The Mexican example may be seen a possible explanation of the way in which a comparison of the processes of fermentation and of sex was applied. Making of personality has attached to itself various terms and ideas of 'impurity.' Similarly the ingestion of leaven has been regarded as resulting in an impure condition of the material acted upon. Leaven itself is a symbol of corruption. Thus, an impure state in the persons engaged may induce a similar impurity in the object of their labours. Conversely, in other circumstances, it may expedite a desired change, as from barrenness to fertility. A similar objection to mixture may be seen in an Australian custom. If we compare with it the rule of the Timorean priest 16 which forbids him in war-time to drink cold water, and orders him to drink hot water only, so as not to cool the ardour of the warriors, we may see how a rule arising naturally from an aversion to anything exciting or disturbing, when important operations are in progress, may be sophisticated subsequently. The Australian case shows an earlier stratum of psychosis.

The Ekaahlay people believe that, if a medicine-man have many spirits in him, he must not drink hot or heating drinks. These would drive them away. Also, spirits would never enter a person dolted by the white man’s liquor. 8 The Zambi rainmaker, in order to keep his spirits with him, never touches alcohol. 10

When the savage has reached the idea of a spirit informing his own organism, he has usually also reached the idea that heating or spirituous liquor is itself possessed of a spirit. Thus, if he wishes to potentiate the action of a drug spirit, he must, in sober earnest, refrain from mixing it with others.

The caro bestowed on the preparation of liquors 17

is also evidenced in the ceremonial hand-selling of the new wine.

Thus, among the Mexicans, the priest of the god Itzitluk, a
holder of children, invested with the god's robes, opened the
new wine annually in the houses of the people, and ceremoniously
tasted it. It is also made by the Nagas in the feast of
Reigniet in January. This is a genus, or occasion of tabu, and
men carry forth the liquid, spouting not a peculiar sound, and during the
manufacture men and women eat separately.

From this 'tasting' develops the sacrifice of the first-fruits of the vine. The Romans sacrificed the first of the new wine to libate it; and this, till this was done, the wine might not be generally drunk.3

The mechanism of drinking as practised by Europeans is more or less identical with that of eating. The liquid does not fall, it is sucked and swallowed, but each gulp is grasped by the tongue and passed down. Thus a man is able to drink while standing on his head.

Many peoples, however, either have not reached this method or have modified it.4

The wild men of Malaysia drink by throwing the water from the hand into the mouth. The Orang Laut do this with un-
expected aim, a display of more than ordinary ability. Sometimes children are expert. A mother gives her infant water by dripping it from her hand. A New Hebrides native throws the
water back, and literally pours the liquid down his throat without gulping. The ordinary drink in Oceania is the juice of the hub-
rua fruit, or of the Trichilia, a tree resembling the hibiscus, and
in the Himalayas the juice of the morinda. At times boiling water is sucked into the mouth. It is unmanfully to touch the shell with the
hand, and therefore their drinks their liquor through a gourd. In the Hindu ritual of meals, food is eaten with the right hand, but water is drunk with the left; the vessel is taken up with the left hand, and the fingers are slightly bent while the drinker places the
vessel on the forehead, and then, allowing the vessel to touch the lips would be indecorous. The Fijians never put a vessel to the lips when
drinking. They regard it also as objectionable for several per-
sons to drink out of the same vessel. A Mardi chief would not touch a calabash with his hands when drinking; he held his hands close to his breast, and another man, a slave, poured the
water into him. It was a grave crime to let any one use a cup
rendered sacred by having touched its lip.5

The average Bengalee stands with one foot on a wooden stool when standing posture.

Three glasses are to be taken before a draught, for the reason that the stomach does not absorb water quickly, and health cannot be impaired by it. Drinking from the mouth of a leather bag was forbidden. 'He who drinks out of a silver cup drinks of bell-fire. The faithful may not drink out of green vessels, large gourds, or vessels covered with pitch, the last being used for
wine. During the fast of Ramadan it is held that even to
swallow saliva between sunrise and sunset is a sin.6

The natural tendency against mixing re-appears in the custom of not eating and drinking at the same time. This is only partly modified by physical need. Certain foods require a liquid vehicle, and certain drinks stimulate digestion.

When eating rice the Malagasy drink water. But otherwise they rarely drink at meals. The Hindus do not drink until the meal is finished. The natives of Borneo usually drink only after eating. They say that by abstaining from taking liquid with their food they prevent indigestion. Among the Halfa tribes of the Central African savannah maize drinks between meals, but this water. The A-kaboyu never drink at meals, but drink at any time when thirsty.7 The Abyssinians drink nothing at meals.8

Eating, especially in the somewhat rapid method used by early peoples, is hardly compatible with conversation; hence many rules against eating and talking at the same time.

Drinking does not then follow meals. When drink in alcoholic, there is still less restraint of the tongue.

In 15th century England 'people did not hold con-

alcohol on the larvae can hardly apply to the Cholta Nagpur rain. Some explanation more in accordance with the evolution of mind seems to be required.

In the following, ideas of sympathetic adaptation appear:

Here the preliminary ceremonies for making rain among the Arunta no water may be drunk, else the magic would fail;—no one may try to drink for fear of touching the old chief's body by the same road as the massage (beer). When the king of Congo has a milk-drink, he has a cup of wine brought: he that brings it has a bell in his hand, and, as soon as he has delivered the cup to the king, he turns his face away. A man with a bell, or bell in hand, all present fall down with their faces to the ground, and continue so till the king has drunk. The king would die if he were seen in the act of drinking. When Winwood Reade offered the king of Canasa a glass of rum, the monarch hid his face and the glass under the table when the king of Dahoonay drinks in public, a curtain is held up to conceal him. Bowdich describes the scene of Ashanti drinking: music played, and the soldiers, brandishing their swords with the right hand, covered their noses with their left, singing meanwhile the monotone: 'dink, dink' till the drunkind the extremity of the curtain. A man of consequence never drinks before his inferiors. If it is said in Ashanty that an enemy can most easily impose a spell on the faculties of his victim when drinking. A son of the king of Congo was put to death for having accidentally seen his father drink. A Pongo chief never drinks in the presence of others except behind a screen. When the king of Uganda in Central Africa went to the royal dalay to drink milk, the men dispersed and the women covered their heads. No one might see him drink. A wife handed him the milk-bowl, but turned her face away.

The Thompson Indians believe that enemies can injure a man by magic when he drinks. A Warao when drinking holds a cloth before his face. The habit is particularly strong in the presence of a woman. "I had," says Cameron, "to pay a man to hold my hand to drink; I could not make a man let a woman see him drink."1

In these cases the development takes the form of a refusal of ordinary, familiar, customary gratification. From the Steinen found in Central Brazilian tribes a sense of modesty, attended by shyness and blushing, exhibited when alimentary functions were in progress, a sense as keen as that shown by the majority of the human race in the matter of sexual functions.2 In similar rules cited below there may be seen not merely habits of etiquette, but a sense of modesty and a law of decency, involving the fear of exciting disgust. The idea that such practices hinder the entrance of evil influences, or prevent the soul from escaping, is a later sophistication, and cannot explain their origin.

When the Indian of Cape Finlizzy falls ill, he often accuses it to a demon which entered his body when he was drinking at a stream.3 Bulgarians before drinking make the sign of the Cross, to prevent the devil entering his body.4 Devout Russians used to blow on the glass to drive Satan from the liquor.5 With the Greeks, the soul may be longed for to remain, though the mouth is dangerously open, by offering it a share in the beverage. When the hair of the Siamese boy is cut, there is a fear lest the kham, the guardian spirit of his head, may depart. It is enlaced and captured; then coco-nut milk is presented in a cup, and thus by absorbing the drink of the kham he retains the kham itself.

Rules of drinking, more or less impregnated with superstition, occur all over the world.

In Wasi it is a serious offense to use a cheap drinking-cup.6 A Macör who drinks from the cup of a man who wished him ill became bewitched.7 The Niam-Niam, who are said to be 'particular at their meals,' that is, to observe alimentary decency, wipe the rim of a cup before passing it on.8 Great cars was taken by the Fijians that no one should touch the king's cupbearer. They regarded it as an invariable precaution for several persons to drink out of the same vessel, and held that pollution was carried by saliva.9 The civilized man has the same instinct of isolation and of excluding foreign elements from his drinks.

Contact with particular persons is avoided.

According to the rules of Kafir biontir, relatives of a husband will not drink milk at any kral connected with the wife, nor will the wife's relatives at a kral connected with the husband. For some time after marriage the wife will not use milk. The principle is this: two kral, of which one is a kafir ('dulled') if she consumed her own purchase. After a visit to her father, from whom she takes a goat or ox, the kafir is removed, but the animal is slain, and the female 'dull' passes from the milk into the animal. She has 'cleansed her species.'

In the above case we have probably little more than a phase of etiquette. In others there is a distinct fear of contaminating result in various conceptions of the influence of sacramental purity.

In Tonga, inferior persons might not drink in the presence of superiors, and the various 'ranks' could not drink together.10 In India, water cannot be accepted by high-caste from low-caste persons.11 Even Fakaraka will not drink with Kerisla.12 Among the Nias, whence village feuds are frequent, one village may often be found refusing to drink from a running stream which supplies another.13 New Guineas natives refused to drink water offered to them by Europeans.

In cases like the last there is perhaps no definite conception, merely a vague uneasiness about the unfamiliar. A similar sensitiveness occurs in the case of unfamiliar or untested drinks.

When the Eskimo find a new spring, an eugok, or the oldest man present, drinks of it first to rid the water of any forpusanul or malignant quality which might make it ill. Similar ideas are connected with the hospitable practice of 'tasting,' though there is not clear that this is in no sense the reason of the custom.14 At palm-wine drinking the Krunus hosts takes a mouthful, then drinks fast and last drink himself, in order to take off the feish. The same notion may be involved in the ceremonial tasting by an official of the new wine and the new fruits.15 In India, before drinking wine the chief, the priest or 'captain' of the chief tastes the liquor, to show decency that it is not poisonous, yet it is common for natives to drink the water they offer to a stranger, to prove that it is free from poison.16 Among the Zulus it is not etiquette to offer beer to any one without first tasting it.17

Drinking with a woman is avoided by many peoples in various stages of evolution. The Benjamin would not take drink from the hands of a J. G. Senn, in Smithsonian Contributions, Washington, xvl. (1870) 77.

woman on any consideration. 1 An artificial horror is generated in such cases. The Muskhogees hold it equivalent to adultery that a man should take a pitcher of water from the head of a married woman. It was permissible for him to drink if the woman removed the pitcher herself, and retired after setting it on the ground or another line of mouth. For if the Arunta hold that a draught of woman's blood will kill the strongest man.2

Among the Kaffirs and the Bhumos a menstruating woman may not drink milk; if she does, the cows will be injured. She is restricted to beer. 4 At his daughter's first period, however, a man must abstain from the spot an old cow was fed exclusively on, and its milk constitutes her only food. 5 After being delivered, the Greenhod mother gives her a cup of water for her own use; if any one else drinks from this, the rest must be thrown away, 6 Play mentions the belief that, if a menstruating woman touches wine, it turns vinegar. 7 In various parts of Europe it is still believed that if a woman in her courses enters a brewery the beer will turn sour; if she touches wine, vinegar, or milk, it will go bad.

On the face of these customs and ideas there is a regard both for the woman's own safety and for that of others. She is rendered quite helpless by being insulated, and at the same time is removed from danger. 8 It has been further suggested, for the explanation of similar cases, that any taint of sex would remain in the milk of cows, and that the sympathetic link between the milk and the cow may be snapped by any process which converts the milk into another substance, such as cards. Members of the 'sacred house' may themselves distribute without injuring their source. 9 On this principle the Wanyamwesi practice of mixing vaccine or human urine with milk has for its object the safeguarding of the source. 10

The Jalal of Northern Morocco believe that a murderer is permanently unclean. Poison oozes out from underneath his nails; hence anybody with whom he comes in contact in which he washes his hands will fall dangerously ill. 11 Among the Zulus a wounded man may not touch milk till a ceremony has been performed. 12

The sources of contamination dangerous to drinking are not universally the same. There are some variations, as perhaps the law of Muhammad that a vessel from which a dog has drunk is to be washed seven times before it is used by human beings.

A universal source of contamination is death. After a death the Zulus drink no milk for a day; the mourners also. For some time the widows and widowers apparently are permanently forbidden its use. 13 All that has a bit of a carcass may not drink milk until he has been purified. 14 The dead who has touched a corpse has to drink out of a special goatskin. 15 In the same circumstances the Thompson Indian has to spit out the first four mouthfuls whenever he drinks. 16

For the classification of the various magical properties of drinks the Zulu theory is instructive. But neither here nor elsewhere can a line be drawn between inherent and acquired characteristics. The Zulus logically distinguish between two complementary species of magical drinks. These are 'black' and 'white', negative and positive. The former renders, for instance, everything that causes a man to be disliked; the latter gives him 'brightness', and produces liking and admiration in others. The former is emetic in its properties. The ejected matter is placed in the fire; thus the 'badness' is consumed. The white drink, when used, for instance, to command the affections of a girl, or to cause her to bear a grudge against some object that the person referred to has worn next the skin. 17

Drinks of the first class have the properties of liquids when used for washing; those of the second have the properties of medicines, stimuli, or purificatory drinks which share food with food and drugs. A distinction is clearly to be drawn between the latter class and drinks which have been contaminated by alien contact or by drugs.

Just as mythology developed the generic idea of drink into a water of life or of immortality, so it has developed the idea of cleansing into a water of oblivion. The 'Drink of Forgetfulness' is found in Greek, Hindu, Norse, and Arabian mythology.

In Fijian mythology the spirit of the dead man on his way to the other world drinks of a spring. As soon as he takes the water, he ceases weeping, and his friends forget, and weeping, forgetting their sorrows. This savage Water of Lethe is called the Water of Eternal Spring, or 'his three caves of wine, the Anu sati fal; the drinking of this terminates the mourning. The Kairahs effect the same thing to the Hindus by the use of water touched by a Brahman. 8 In South India holy water is drink to terminate mourning. In Roman Catholic ritual a sick man drinks water which the priest has washed his hands. 9 At the end of mourning the Kaffir widow rinses her mouth with fresh milk. 10 Class Indians 'purify' themselves after a funeral by drinking hot water and washing themselves; 9 cleansing thus both the outer and the inner man. In Central Africa the possessing spirit leaves out of a man by drinking an opium solution. The Gogos believe they purify themselves by drinking spirits. 11 Among the Orissa man is re-admitted to the world when he has drunk the blood of a goat to wash away his sin. 12 When the Bilhpur Bedars re-admit an adulteress, they touch her lips with a red-hot twig of Aspideles pinnata, and give her liquor to drink. 13 In Mexico during 'the bad days,' which recur every four years, children are made to drink spirits. 14

In these and similar cases there is a preference for 'strong' water, whether it be hot or spirits, or blood, or containing some added virtue. It is difficult, therefore, always to distinguish 'purgation' from the ingestion of virtue or magic. Most magical drinks certainly have both negative and positive properties. This is the case, whether literally by acquisition or metaphorically by imagination, with water itself.

The Muskhogee custom of Savannah drunk Ganges water only, not from piety, but because of its medicinal properties. The water of which all men else had been washed and which had been 'distribute to the effect-water.' The Kanges drink water to which the priest has washed his feet. 15 In early England a cure for demoniac possession was washing and drinking the same ozen water. 16

From this aspect drinks are suitable for purposes of consecration and institution. Their virtue gives a vigorous set-off in the new state.

In old Scandinavia the new king drank a horn of liquor before taking his seat on the throne. 18 European monarchs after coronation take the Sacrament. So in Catholicism do married couples. Interesting variants are the following. In Asianten times the first food given to the newly-born child was the homoseale juice. Among the Tahi peoples the father gives his son a name by spitting rum from his mouth upon him. Ram is poured from the ground into the new-born's hand.
When a child is received into the Kak-klo of the Zulu, his 'godfather' acts as a sponsor, and takes the vows in place of the child, unless the child himself chooses to do so himself.

As part of his initiation the Southern Masim buy drinks salt water mixed with uripe mango-flake. He bathes in the sea, and then is fed with Beniskoro, the vine. Then he is given some coconu milk. Whatever the meaning of these drinks, they play a considerable part in his initiation. In savage papal corporal communion milk is sometimes drunk in connection with a pretended new birth. Ancient religion had this fiction. After the initiation the new-born (p.m.) the initiate was fed on milk, like a new-born babe.

Ideas of invigoration are one of the most obvious results of toasting the drinks. 'Dutch courage' has been an important factor in history. At a ceremony previous to war the Tshoerese give their headmen palm-wine outside the temple. After drinking the wine they go round seven times around the temple. This custom is possibly a na?ve way of inspiring the leaders of the people. Ancient classical authors give several accounts of races whose practice it was to go into battle drunk. It is extremely probable that the funeral sacrifices of men and animals in many cases involves an intention to vivify the spirits of the deceased with the warm, juicy, heady life of the creature. The slades in Hades renew their life by drinking blood. The offering of a drink is a frequent method of animating a fest, and is as much regarded as an institutional rite. The Tabo negro squenses rum upon his new-made subman, saying it is the best of all.1

In metaphor and mythology drink plays a considerable part than food. From similes like 'as cold water to a thirsty soul' to the metaphorical description of some as 'a God-intoxicated man,' all the psychical reactions of drinks are expressed in language.

In religion the story of wine constitutes a distinctly ideal element, and it is here that the function of drink receives not only a sort of apotheosis, but perhaps a sound physiological explanation. The Vedas state that the gods were originally mortal; immortality was acquired by, among other methods, the drinking of soma. Similarly the Homeric gods attained immortality by drinking nectar and eating ambrosia. In the mythology of ancient Babylonia, Hasidus brought into the ark a supply both of beer and of wine. According to the Mexicans, the first human beings were created by the gods fed on pulque. The sociological significance of orgiasticism has not yet been studied.

Wine or spirituous liquor inspires mysterious fear. The alchemical mental state which it produces suggests the idea that there is something supernatural in it, that it contains a spirit, or is perhaps itself a spirit. The Japanese, intoxicated by this spirit, arrack, says he is possessed of the spirit, in the Animistic sense, of the liquor. Thus the juice of the grape is the blood of the vine, its soul or life. The drinking of wine in the rites of a vine-god like Dionysus is not an act ofrevoly, it is a solemn sacrament.

Some typical cases of the religious and social uses of strong drink remain to be mentioned. No attempt is made to define stages of evolution. The earliest Brahmans used spirituous liquors in acts of worship. Arrack was offered to the gods. The Sautrmanasi and Vajapeya rites were typical for the drinking of wine, and the earliest evidence in civilization is the soma of the soma. The Vedas prohibited the worshipper from drinking the ceremonial liquor for a sensuous purpose. The Saktas to-day have actually the same principle, and purify the liquors before worship. The followers of Zarathushtra have clung to the old way more consistently than the Hindus. Liquor-drinking forms part of almost all Parsi ceremonies to-day. Liquor is specially consecrated on New Year's Day.

The Eucharist in its early form has the mark of a periodic wine-drinking, breaking up the 'fast' of work-a-day life. It is necessary for organizers like St. Patrick to prohibit excess, which shows that wine was freely taken. The wine represented the blood of Christ and conferred immortality. In the course of history the use of wine has been lent to the ideas of the Church, and in Churches which allow all worshippers to partake of the chalice the wine is not drunk but tasted. The Hebrew Cup of Blessing is an analogue of the wine of the Christ's Supper.1 Of course Christians made a free communal use of the sacred drink; it was given to the dead; vials of it were placed in the grave, with cups inscribed with toasts, such as 'Drink and long life!'

For very special offerings to a god the Bhils make kowari, 'virgin liquor.' The distillers in this case must bathe and wear newly washed clothes before commencing operations.

For special effects, and as an inspiration, a priest may become intoxicated. On certain days the high priest of the Zopatos is obliged to be drunk. On one of these he cohabited with a Virgin of the Sun.

Gods reflected in an intensified form the ideals and habits of their worshippers. If a god is housed, clothed, and fed, he is also supplied with drinks.

A different problem is presented by various customs of eating the dead. Their discussion belongs elsewhere; but they show variation even in the case of drinking.

The Cucumae of the Amazon ground the bones of their dead to powder and drank this in their beer. They said 'it was better to be inside a friend than to be swallowed up by the cold earth.' The Xinamas mingled the ashes of the dead with their drink.11 Here there can be no survival of cannibalism. The Angoni make the ashes of the dead into a broth. This must be lapped up with the hand, and not drunk in the ordinary way.12 The native practice, generally confined to the women, of drinking some of the fluids drawn from the decaying body of a dead relative is a commonplace of Australian anthropology.

As a preliminary to the problem may be mentioned the frequent occurrence of morbid perversions of appetite in cases of strong emotion. Such perversion is applied to a psychosis of affection or respect, the Australian and similar practices are more easy to understand.

The Irish wake is a familiar example of the practice of drinking to celebrate the death. In West Africa the men drink heavily during the fast which follows a death, and the mourners are generally intoxicated.10 The same custom is found in the Yorubas.10 But it is chiefly after the funeral that drinking is the rule of the feast.

At funerals among the Wouwla Indians there is much drinking of wishish. A long line of cotton is stretched, like a telegraph wire, from the house of the dead, where the drinking place is set, to the burial-ground where the body has been deposed. I have seen the white thread following the course of the river for many miles, crossing and re-crossing the stream several times.11 As soon as a Hangala man dies, the family gets in large supplies of sugar-cane wine. Drinking and drinking are carried on for three or four days and nights, until the wine is finished.12 The Guiana Indians drink and dance at the funeral feast.

Among the Tshiyal of the Zambesi the native beer, pombe, plays a considerable part in post-mortem ceremonies. The瞳tz of Bones, a large quantity is prepared. Holes are bored above the grave and pombe is poured in. In one hole, in front of the house where the grave is, the mourners wash their hands with pombe. As the procession retires, a widow of the deceased (she is called mission to-day, that is, after the spirit), her head covered with calico, constantly calls out for pombe, which she drinks beneath the

J. M. Campbell, in JA xvi. 510. 3 Co 110.
covering. At the house of the head widow a large hole is dug and the liquor is poured in. Every one falls down and drinks it without help of spoon or vessel. A feast follows, consisting of porridge and meat.1

Various considerations, some of which are supplied by the individual accounts, suggest that drinking at funerals and their anniversaries is motivated by a double impulse, or rather by two complementary impulses, namely, the desire to stifle sorrow, and the desire to lift the dead man thereunto in the good things of the world to which they still belong, though absent in the body. These two expressions of feeling, coupled with the 'sympathy' shown by the community, render funeral drinking a typical case of social instinct. Secondary ideas necessarily supervene.

The universal employment of a drink of fellowship to initiate and also to terminate a social process is found in the case ofpuberal ceremonies, though rarely. The reason is that, in this case, the process does not include a pair of persons. In the case of marriage and covenants this essential condition is satisfied. Here it may be said that the reciprocal process in the former class is between the son and the members of the social state to which he is admitted. And in many analogous cases this is recognized, though the mind in its universalmore slow to recognize than to concretize an abstract idea as that of community. But in these stages the other member of the couple may be found in the 'godfather' or sponsor, on the one hand, and individual members of the other, either of the same or of the other sex, the latter being the indirect object of the initiation. Thus among many early peoples the boys after initiation drink with the girls. Similar ceremonies are performed in connexion with the willow water. Pick up the kambu youth makes honey-beer, and gives it to the elder who looked after him during the ceremonies.2 At the end of the ntonjane, the Kaffir ceremony performed to celebrate a girl's arrival at puberty, the girl's nearest female relative drinks milk, and then hands the bowl to the girl to drink.3 From such practices there may easily develop ideas of taboo, which is to be ended by drinking or other rite of passage. Thus, in Central Australia the man whose blood has been taken to supply another with health or strength is taboo to him until he releases him from the 'ban of silence' by giving him his mouth.4

Marriage is universally the occasion of a social feast, and the rite in which the bridal pair drink together is one of the most prevalent methods of tying the knot. There is thus both individual and social drinking at weddings. Sometimes the latter is not shared by the marrying parties; sometimes the individual drinking rite is extended to relatives; and sometimes it is carried out by them as sponsors for the bride and bridegroom. Naturally there is considerable variation in the ritual of the act of union.

At Tiperah weddings the bride receives a glass of liquor from her mother; she takes this to the bridegroom, sits on his knee, and, after drinking some of the liquor, gives the rest to him.5 Among the Kalbi, milk from the bridegroom's cows is presented to the bride. Her drinking of this milk renders the marriage complete, and the tie indissoluble. The guests exclaim, "She drinks the milk! She has drunk the milk!" Among the Nubi Kifanah of Thana, liquor is given to the pair when the marriage ceremony is complete.6 In the Kyaungba, the rite of the Kyaungba bride bar the entrance to the village against the bridegroom with a bamboo. Across this he has to drink with them a 'loving' cup, and every one lies down and drinks it without help of spoon or vessel. A feast follows, consisting of porridge and meat.7

In the Mozambique, Japan, Bengal, Indian, and European cases of marriage, the bride and groom are given a man's cup containing its milk. The man drinks, and the woman after him.8 Among the Larks, a cup of beer is given to each of the two parties; they mix the beverage, then drink it. This completes the marriage.9 In the Moluccas, Japan, Bengal, Indian, and European cases of marriage, the bride and groom are given the cup to drink from, Kaffe to drink.10 In the Christian countries the marriage ceremony is separated from the wedding ceremonial proper, but is carried out indirectly when the pair receive together the wine of the Communion, which is to be partaken of immediately after the marriage itself. Among the Gody, the respective fathers of the bridal pair drink together.11

Drinking together at marriage is a rite which applies to two parties the principles of social drinking. Sharing in an act is a sort of reciprocity, and together with interchange of gifts constitutes the universal and fundamental principle of society. The more abstract ideas of similarity, union, and identity follow, and the simple ritual of sharing has a corresponding development. From the beginning there are also involved in the process, but unconsciously, the psychological feelings of refreshment, and in particular to the effects of alcohol, which increase both self-feeling and altruism. Pure altruism is the primary motive of many a custom which involves a simple sharing of drink. Here is the virtue of the man who gives a cup of cold water to a little one (Mt 10:42). The natives of India have the custom of erecting sheds for the giving of water to passers-by. After initiation the boy has reciprocal motives, such as a general desire to conciliate or a wish to avoid the injury of a curse or an evil eye, come to obscure the primary. In the procession preceding the circumcisions in Egypt, the boy is a servant carrying a skin of water and brass cups. Now and then he fills a cup and offers it to a passer-by. Another servant carries a tray with materials for coffee. It is his business, when they pass a well-dressed person, to fill and present him with a cup; the person gives him something, perhaps a half-piastre. The analogy of other Egyptian customs suggests here the avoidance of the evil eye.

Even towards slain animals and the human objects of social resentment pure altruism is shown. Indians of the Orinoco, after killing an animal, pour into its mouth some liquor, in order that the soul of the dead beast may inform its fellows of the welcome it has met with, and that they, too, cheered by the prospect of the same kind reception, may come with alacrity to be killed.12 One may take leave to assign a worthier motive as the origin of this custom. Similarly, though primitive peoples share their drink with the dead, some have learnt to explain the custom of placing such things in the grave as a method of inducing the dead to be quiet, and not to come and pester the living for anything they want.

The co-operating totems of Australia are perhaps the earliest instance known of the principle of co-operative drinking.13

2. Hakluyt, 16.
6. Lichtenstein, i. 262.
7. BGS xiii. 120.
operative industry elevated into a system. Among the totems of the Central Australians is a water-totem. A member of this may drink water when and where he pleases, but it is not necessary for him to receive it, or the permission to take it, from an individual who belongs not to that totem, but to a moiety of the tribe of which the water-man is not a member. The principle, according to Spencer-Gillon, is that of mutual obligation between complementary food-totems, regulating the supply of food and drink. 1

But the principle of reciprocal service is at the root of all social phenomena. Some of its forms are curious; others seem totally unlike the original type. Secondary ideas, once more, are responsible for these fluctuations. An African wife drank the medicine intended for her husband, in the belief that he would be cured. 2 A similar notion is seen in the belief that what a man drinks may affect the child whose birth is expected. A further development is reached in such customs as that of the Kwakiiitl Indian, who, after biting a piece of flesh from the arm of a foe, drinks hot water in order to inflame the wound. 3 At this stage of sophistication there is often a choice of absolutes. The Indians of the Andes are supposed always for his own digestion rather than for the increase of suffering on the part of his foe.

Another case of the intrusion of a secondary idea is found in the Australian custom of drinking human blood before starting on a 'a nullinga' (avenging expedition).

' Every man of the party drinks some blood, and also has some spurted over his body, so as to make him what is called soliduma, that is, lithe and active. The older men indicate from whom the blood is to be drawn; and the men so selected must not decline, though the amount drawn from a single individual is often very great; indeed, we have known of a case in which from a young and strong man until he dropped from sheer exhaustion.' 4

The beginning of a venture or expedition is universally celebrated by drinking, on the principle of invigoration, as in the old English 'stirrup-cup.' But in the Australian example a further notion has come in. On such an occasion a man joined who had some connexion with the tribe to be visited, he was forced to drink blood with the party, and, 'having partaken of it, would be bound not to aid his friends by giving them warning of their danger.' 5

The Indians of the Cordilleras drink of the water of a river, and pray the god to let them pass over. So did the old Peruvians. 6 Digan's army at the banks of the Ubulinganto strewed charcoal on the water, to prevent all other people being to deprive some evil power possessed by the river. 7 More probably the aim is to adapt one's self to the object by contact, to produce fellow-feeling and sympathy by communion.

Ideas of this kind are similar to those concerned in marriage ceremonies of drinking, but involving from the outset, or at least producing, ipso facto, the secondary ideas of mutual responsibility by means of inoculation, or ingestion of another's substance, or a conditional curse, have built up what may be described as the legal forms of social drinking. The drinking of human blood, or of wine produced from such blood, has been a form of covenant among various ancient and medieval peoples, as well as among certain savages. 8 He who has drunk a clansman's blood is no longer a stranger but a brother, and included in the mystic circle of those who have a share in the life-blood that is common to all the clan.' 9

Robertson Smith's induction is actually a tertiary stage of thought on the subject, but present and powerful in the social consciousness of Arabs and other peoples. Among other details in point is the fact that blood-drinking is often produced by drinking any substance other than blood. See BROTHERHOOD (artificial).

The ordeal, often termed 'drinking the oath,' is a legal application of a ceremonial drink. To extract the truth from a man, the Negro dips a boleona in rum. This rum is then offered to the man, and, if he lies, makes his belly swell. A man claiming a right to the use of a person drinks the water in which he has washed the corpse. In legal actions between the chief, the offender drink is drunk at an oath and celerel. It is a poisonous emetic. 10 A Masai accused of a crime drinks blood, and repeats these words: 'If I have done this deed, may God kill me.' 11

Hospitality, a virtue of universal occurrence, is often complicated by superstitious accretions due to fear of the stranger within the gates. As soon as the stranger enters the houses of a Jivaro or Canelo Indian, each of the women offers him a calabash of chicha. A guest is welcomed by the Herero with a cup of milk. These are simple acts of fellow-feeling. It is characteristic of the true drinking Arab races that the custom attains complexity. Among the nomadic Arabs of Morocco, 'as soon as a stranger appears in the vicinity, some water, or, if he be a person of distinction, some milk is presented to him. Should he refuse to partake of it, he is not allowed to go freely about, but has to stay in the village for sake. On asking him what he meant by this custom, I was told that it was a precaution against the stranger; should he be local or otherwise a disbeliever, his drink would cause his knees to swell so that he could not escape. In other words, he has a conditional curse.' 12

Zaid-al-Khali refused to slay a chief who had surreptitiously drunk from his father's milk-bowl. 13

Health-drinking, the propinioit of the Latins, has some variants in the drinking as a test of friendship, the sharing of a drink; the person doing honour drinks first, and hands the cup (in Greek life this became the property of the person honoured) to the other. Another is drinking with a sign, such as a mark or a sentiment of goodwill towards the person honored. The projection outwards of the drinker's will is typified in many languages, as in most of the customs, by emphasizing the fact that he drinks first. Among the Ba-Yaka and Ba-Humua, the host drinks first, and the guest after him. 4 At Abyssinian meal-drinking the host drinks first, by way of showing that the liquor is not poisoned. He notifies a servant which guests need their cups replenished. On receiving the drink, the guest rises and bows. 5 Among the Kabris, it is not etiquette to give beer to a guest in the act of tasting it. This, according to the account given, is intended to safeguard the guest against poison. 6

Terms like 'pledge' connote the idea of guaranteeing goodwill. The poison-test is obviously not the origin of the custom of the host or pledge drinking first. When that custom took on secondary ideas, one of these would be the affirmation that what the host offers is his own, and that it is of his best.

In barbarism the drinking-bose so called is often the form of political discussion. The chief of the A-kikuyu gives his people the news at beer-drinkings, to which he invites them. 7

With agricultural drinking-feasts we return to man's immediate relations to intoxicating or refreshing drink. Drinking partly takes con- nexion with the ceremonial eating of the new crops.

Lithuanian peasants observe a festival called Saboria, 'the mixing or throwing together,' when the sowing of the new corn has taken place. The Ceremonies celebrate the baking of the first bread from the new corn by a ceremonial mixing of beer. 'The whole ceremony looks almost like a caricature of the Eucharist.' All the drinking of the rich and the peasants of South India drink a liquor of milk, honey, and sugar. 8

In such rites there is the social consecration, implicit or explicit, of wine itself and its sources. It is perhaps merely an abnormality that fasting among many peoples does not exclude drinking water. In other cases it is notably the case in West Africa. Spirits are largely drunk during the fast after a death, and mourners are generally intoxicated. During the fast-days of the yam harvest the people drink hard, and the king and chief distribute broadly the run. For various obscure reasons, great personages of the sacred world are often restricted to pure water. The Druids were restrained from a prescribed quantity of wine per diem. Plutarch says they never drank it at all, because it is the blood of beings who fought against the gods. The chief of the Kurems of Burma 'attains his position not by hereditary right, but on account of his habit of abstaining from rice and meat. The mother, too, of a candidate for priestly rank must have cherished these things... so long as she was with child. During that time she might not... drink water from a common well.' The Bodia, or Bodii, the point of the Greco people of West Africa, may not drink water on the highway. Here there is clearly a reference to 'priety.' 

As the Egyptians, and many others, would interdict stimulating drinks, as it interdicts all tendency to expansion. 'Water was the principle and most sacred of the primitive monks; and the founder of the Benedictines regrets the daily portion of half a pint of wine, which had been extorted from him by his monks of the age. All drinking water is sacred.

Many peoples low in the scale of culture emphasize by law the natural aversion of childhood, not to speak of womanhood, to intoxicants. The A-kikuyu, for instance, allow no one to drink beer until he has reached the status of 'elder.' The Chaco Indians forbid women and children, even youths, the use of intoxicants.

DRUIDS.—The elaborate system of theology and philosophy ascribed to the Druids by the older school of writers, and the esoteric doctrines supposed to have been handed down from pagan times in the bardic schools of Wales, have no foundation in fact, though they still have a hold upon the popular fancy, which loves to think of the Druids as a mysterious Celtic priesthood, guardians of pure doctrines—the relics of a primitive revelation. Much of this is due to the classical writers themselves, who have strung notions about the Druids, a strictly scholarly examination of the evidence proves that there was little that was mysterious or esoteric about them; nor, though we may regret the puerility of the evidence, is it likely that, had it been fuller, it would have given any support to those unscientific opinions. Our knowledge of the history of the Druids rests mainly upon what Caesar, in a passage of some length (de Bell. Gall. vi. 13 f.), and Pliny and other writers in shorter notices, have handed down, and upon occasional references in the Irish texts. The monumental and epigraphic evidence is practically nil, although Dom Martin (Rel. des Gaulois, Paris, 1727) and others insisted that the figures on various bas-reliefs in Gaul were Druids enshrined in ritual.

1. Origin of the Druids.—Opinion is still divided regarding the origin of the Druids, whether they arose in Gaul or in Britain, and whether they formed a pre-Celtic or simply a Celtic priesthood. Nothing was known definitely by the classical observers. While Pliny (HN xxx. 1) seems to think that Druidism passed from Gaul to Britain, Caesar (B. G. iii. 18) says: 'The system is thought to have been devised in Britain and brought thence into Gaul; and at the present time they who desire to know it more accurately generally go thither for the purpose of studying it. But what is especially the case is, that it is relating what was a current opinion rather than an actual fact, since he says 'is thought' (exstituitur). This opinion has been based on the fact that the Druids were held to be purer in Britain than in Gaul, where, in the south at least, it had perhaps come in contact with other influences, e.g. Greek philosophy, through the colonies in Marseille. Taking Caesar's words as a statement of fact, D'Arlbois de la Buneac (Les Druides, Paris, 1906, p. 23 f.) and others (Desjardins, Hist. de la Gaule rom., Paris, 1876-85, ii. 518; Deloche, RDM xxxiv. 448) hold that Druidism originated in Britain. The former maintains that the Druids were the priests of the Goëides, who, when conquered by the Celts from Gaul, in turn imposed their priesthood upon their conquerors. The Druidic system then passed over into Gaul about 200 B.C., when the Celts were equally triumphant. All this is based upon no other evidence than Caesar's statement.

Valerius (Les Celtes, Paris, 1879, p. 138) further derives British Druidism from the Phoenicians, for reasons which are at once primitive and equally fantastic is its derivation from Buddhist sources (Wise, Hist. of Paganism in Caledonia, London, 1884).

A growing school of writers has on various grounds adopted the theory that Druidism was pre-Celtic in origin, and imposed itself upon the Celtic conquerors in Gaul and Britain. The Druids are not found in the Danube region, in Cisalpine Gaul, or in Transalpine Gaul outside the region occupied by the 'Celts,' i.e. the short, brachycephalic race of the anthropologists (Holmes, Caesar's Conquest of Gaul, London, 1899, p. 15). But the references to the Druids are so casual, especially as no classical writer professed to write a complete account of this priesthood, that this negative evidence cannot be taken as conclusive. Moreover, it cuts both ways, since there is no reference to Druids in Aquitania—a pre-Celtic region (Desjardins, ii. 519). On the other hand, the earliest reference to the Druids in two Greek writers c. 200 B.C. cited by Diogenes Laertius (v. 1), seems to allude to their presence in Gaul, while Celtic priests, though not formally called Druids, were known in Cisalpine Gaul (Livy, xxv. 3). Professor Ihld's postulates Druidism as 'the common religion of the aboriginal inhabitants from the Rhenish to the Rhittarian,' from whom the incoming Celts adopted it (Celt. Brit. ii, London, 1884, p. 72); and in this he is followed by Gomme, who finds many of the Druidic beliefs and practices—the redemption of one life by another, magical spells, shape-shifting, the customs of the Druids in settling property succession, boundaries, and controversies, and in adjudging crimes—opposed to Aryan sentiment (Ethnology in Folk-Lore, London, 1899, p. 22; Village Community, London, 1890, p. 104). This begs the whole question of what was Aryan and what was non-Aryan; and, indeed, there is every reason to believe that Aryan sentiment was not dominant, if not non-existent, in such matters as that of the pre-Aryan folk. Nor is it easy to understand why the Aryan Celts were conquered by the Druidic priesthood, if their 'sentiment' was so antagonistic to the heathenism of the Druids. On the other hand, the arguments used by Reichen (ECCD xiii. 189, 'L'Art plastique en Gaule et le druidisme') in support of the pre-Celtic origin of the Druids suggest a higher religious outlook on the part of the pre-Celtic peoples. The Celts, he says, had no images, and this argues that images were forbidden, and only a powerful
priesthood could have forbidden them. But the pre-Celtic peoples in Gaul had equally no images, while, on the other hand, they had vast megalithic structures. Therefore, again, only a powerful priest can have foreseen the fate of their metempsychosis and foreseen the people to erect the other. The same priesthood, the Druids, continued to exercise that power over the Celts which they had exercised over the aboriginal race. The Celts now adored the religion en bloc; but, when the Celts appear in history, Druidism is in its decline, the military caste rebelling against the foreign priesthood and taking its place. In answer to these arguments it may be pointed out that the Celts do not appear to have had a religious prejudice against images (see CELTS, § XIV); again, the adoption of the aboriginal religion en bloc would be credible only if the Celts had no religion and no priests of their own, while it leaves unexplained the fact that they did not adopt the custom of erecting megalithic structures; finally, the opposition of the military caste to the Druids is no argument for the foreign origin of the latter, since such an opposition has been found wherever these two castes, existing side by side, have each desired supremacy.

2. The ‘gutuatri.’—Besides the Druids, the Celts had other priests, each attached to certain cults like the Roman Flamen. D’Arbois (p. 2 ff.) argues that the gutuatri were the only native Celtic priesthood, and that, when the Druids, whose functions were more general, were adopted by the Celts, the gutuatri assumed a lower place. It is much more likely that they were a special branch of the Druidic priesthood, attached to the cult of some particular god. Anusonius calls Phoebus Belenus gutuatri. D’Arbois refers to the Latin equivalent of gutuatores, while he was of a Druidic stock like another servant of Belenus mentioned elsewhere (Prof. v. 7, xi. 24); and this suggests a connexion between the two. Livy distinguishes the sacerdotes from the antistites of the temple of the Boii (xvii. 24), and this may refer to Druids and gutuatri. Classical evidence tends to show that the Druids were a great inclusive priesthood, with priestly, prophetic, magical, medical, legal, and poetical functions. Most of these functions are ascribed to the Druids by Caesar. Elsewhere we hear of different classes—Druids (philosophers and theologians), prophets, and bardic priests. (Sic. v. 30; Strabo, iv. 4 [p. 197]; Ann. Marc. xv. 9). Strabo gives in Greek form the native name of the diviners as ádrēs, which was probably in Celtic adrēs (Irish ádr). The Druids’ duties in all these classes are performed by themselves, who sing the deeds of renowned warriors; but since adrēs means both ‘prophet’ and ‘poet,’ the diviners may not have been quite distinct from the bards. The connexion between Druids and bards is still clear. No oracle was complete without a philosopher or Druid, according to Diodorus and Strabo, yet both speak of the sacrificial functions of the diviners; while, though the Druids were of a higher intellectual and moral grade and studied moral philosophy as well as Nature (Timagenes), according to the same writer and Strabo, the diviners also studied Nature. Angury was a specialty of the diviners, yet the Druids also made use of this art (Cic. de Div. iv. 41, 90; Tac. Hist. iv. 54), while Pline refers to ‘Druids and this race of prophets and physicians’ (aurum medicuscurum, xxx. 2). Thus the diviners sometimes acted as a kind of sacrist. The Druids’ duties were taken from the sacrifices performed by Druids, while standing in relation to the bards, whom we may regard as another Druidic class. In Ireland we trace the efforts of these priests to detach the Druids who appear in the texts mainly as magicians, though their former priestly functions can here and there be traced. There were the fid (from eulo, ‘I see’ (Stokes, Urkelt. Sprachschatz, Göt- tingen, 1894, p. 277)), learned poets who occupied a higher rank than the third class, the bards. The fid were also diviners and prophets, while some part of the third class, the bards, were also diviners and prophets in Ireland. Hence the two classes stood in close relation, like the Druid and the fid. At the same time, the position of the Druids as a priestly class, the fid remained as the learned class. D’Arbois (p. 108) assumes that there had been a rivalry between the two classes, and that the fid, making common cause with the Christian missionaries, gained their support. But this is unlikely. The fid, less markedly associated with pagan priestly functions, were less obnoxious, and may willingly have renounced purely pagan practices. At an earlier time they may have been known as fithi (=vates), or prophets—a name applied later to the OT prophets and sages (Windisch, Tafeln bei Ciceros, Leipzig, 1865, Introd. p. xiv); but, as they now applied themselves mainly to poetic science, they apparently reducing the bards to a lower position, the name fid designated them more aptly.

The connexion of the fid with the Druids is further witnessed by the fact that the former had an Ard-fid, or chief-poet, and that, when the office was vacant, election was made to it, and rival candidates strove for it (Stokes, Trip. Life, London, 1857, i. 52, ii. 402; Windisch and Stokes, Ir. Texte, Leipzig, 1880 ff. i. 573; ‘Colloquy of the Two Sages,’ Book of Leinster, 187). This resembles what Caesar tells of election to the office of chief Druid (vi. 19), while there was probably a chief-Druid, the filid, as the Druids were elected as judges, as did also the Druids, while both had a long novitiate to serve, lasting over several years, before they were admitted to either class. The gutuatri are known mainly from inscriptions, but Hirlimus (de Bell. Gall. viii. 38) speaks of one put to death by Caesar. An inscription at Mâcon speaks of a gutuatri Martis, i.e. of some Celtic god identified with Mars (Rev. Bryg., 1896, p. 239); two gutuatri of the god Annius occurs in inscriptions from Autun, and another in one from Puy-en-Valay (see Holder, Altelt. Sprachschatz, Leipzig, 1891 ff., I. 340). The antistites tempeli mentioned by Livy, xvi. 24, as found among the Boii, may have been gutuatri, like Anusonius’ antistites. Gutuatri may mean ‘the speakers,’ i.e. they who invoked the gods (D’Arbois, p. 24), or it is derived from the Latin gutuare, to utter, followed by Holder, i. 3406; for another explanation, see Leoh, FCD xxviii. 120), the Gaulish gutuare being Latinized as gutuateru.

3. The Druids a native Celtic priesthood. — There is, therefore, little ground for the theory that the Druids were a creation of, and imported by, the Celts or adopted by the Celtic conquerors. With it is connected the theory that the Druids had a definite theological system and worshipped only a few gods, while they merely gave their sanction to the Celtic cults of many gods or of various natural objects—wells, trees, etc. (Bertrand, Rel. des Gauls., Paris, 1857, pp. 192 ff., 268 ff.; Holmes, op. cit. p. 17). All this is purely hypothetical, and we conclude that the Druids were a native priesthood common to both branches of the Celtic people, and that they had grown up side by side with the growth of the native religion. On the other hand, it is far from certain that many of the pre-Celtic cults were adopted by the Celts, because the Druids were not adored in a section of Gaul, where they felt the influence of Greek civilization, and employed Greek characters in writing (Cesare, vi. 14), some of these cults and
practices may have been abandoned, and the Druids may have become more definitely a learned class. But as a class the Druids were not a philosophic priesthood, possessed of secret knowledge, while the people were given over to superstition and irrational belief. Some of the beliefs of Celtic religion and much of its magic may have been official, in the sense that any one could perform them, just as a Christian may pray without the intervention of a priest. It is probable that the Druids themselves probably practised those cults and used that magic, and doubtless the people themselves knew that greater success was likely to be obtained if a Druid was called in to help on these unoffical occasions. The Druids never lost the magical character which is found in all primitive priesthoods. Hence it is a mistake to regard 'Druidism' as an entity outside of Celtic religion in general, and, on the whole, opposed to it. The Celtic religion, in effect, was Druidism.

The native Celtic name for Druid was probably druids, gen. druidar. In Irish it is drui, druí, or drid (cf. Gaelic draidh, 'sorcerer'). The etymology is obscure. Pliny, connecting it with the Celtic oak-cult, derived it from Gr. ἄρτος, 'oak,' an homonymous derivation (Farrar, Thesaurus, 1884, s.v.) analyzes 'Druid' into drau-vids, regarding the first part as 'oak,' the second as 'divine,' as an intensive, or connecting root with vid, 'to see or know.' The resulting meaning would be 'greatly or highly knowing,' a meaning consonant with the primitive character of the priest everywhere as one who knows more than his fellows (see also Osthoft, Etruskund, Pareng., 1882, p. 196). Diod. Sic. (VIII. 56) and Plut. (De Iside et Osiride, 18), the earliest known writers in the Latin language, use the word, 'to cry aloud,' ofjoma, 'to look,' although the etymology of the latter Gr. word is still uncertain (cf. Boeckh, Dict. Mythol., de la langue greque, Heidelberg, 1870, p. 151). For ogham inscriptions in which the name Druid occurs, see Holder, s.v. 'Druids,' 1. 1350.

4. Were the Druids a philosophic priesthood?

The earliest reference to the Druids by name is found in a passage of Diodorus Siculus (I. 1), who, when referring to the philosophic character of the barbaric priesthoods, cites Sotion and pseudo-Aristotle (c. 2nd cent. B.C.) as saying, 'There are among the Celte and Galate those who are called Druids and Semothoeci.' Cesar, Strabo, Diodorus Siculus, Timagenes, Lucan, Pomponius Mela, and many other later writers speak of the philosophic science of the Druids, their schools of learning, and their political power; but, on the other hand, most of these writers refer to the cruel human sacrifices of the Druids, Mela characterizing these as savagery (iii. 18), while Sestion also describes the 'great power' of the Druids, who were not necessary to immortality. Since Pliny does not regard them as philosophers, but his description of the mistletoe rite suggests their priestly functions, though here and in other passages he associates these with magico-magical rites (II. xxiv. 83, xxiv. 12, xxx. 1). The difference in these opinions shows that a closer practical acquaintance with the Druids revealed their true nature to the Roman Government, which found them more cruel and licentious and superstitious than philosophic. For these reasons, and on account of their hostility to Rome, the latter broke their power systematically (see below, § 12). Thus, it is unlikely that the Druids were reduced to a kind of medicine-men to gain a livelihood (D’Arbois, 77). Pliny’s phrase, Druidas . . . et hoc genus eutum medicorumque, appears to refer rather to their position before the Roman influence and to the fact that they may have been different. Among them—some priests, some diviners, and some practising a primitive medical science. Pliny’s acquaintance with the Druids seems to have been superficial, but he was the first writer to give a correct account of the primitive magical practices belonged to them from the first, and were not the result of Roman suppression. On the other hand, it is probable that the Druids were not the original founders of the whole Celtic area. But the opinion that they were the slyy philosophs seems to have been repeated by a series of writers, without any inquiry whether there was any real ground in fact for their opinion.

The facts upon which what may be called ‘the Druidic legend,’ as it appealed to the classical world, was based were superstition and irrational belief, unlike the Greek and Roman priests (e.g. they taught the doctrine of immortality), they were highly organized, they were skilled magicians, and their knowledge was supposed to be conveyed to the gods (e.g. the language of the gods; Diod. Sic. v. xxxi. 4). On the other hand, we must beware of exaggerating the descriptions, themselves probably exaggerated, in classical writers. Cesar (vi. 14) and Mela (iii. 19) say, ‘They profess to know the motions of the heavens and the stars’—a knowledge which need not imply more than the primitive astronomy of barbaric races everywhere. Thus Cesar’s Druid, Divitiacens (de Boc. i. 41. 90), though professing a knowledge of Nature, used it to divine the future. Strabo (iv. iv. 4 [p. 197]) and Mela (iii. 19) tell of their knowledge of the ‘magnitude and form of the earth and the world,’ of their knowledge of the future, and of their influence over an eternal matter, and in the alternate triumphs of two elements, fire and water. This need have been no more than a series of cosmicomy myths, the crude beliefs of a speculational primitive race.

Similarly, the Druids’ doctrine of metempsychon had certainly no ethical bearing, and, from what may be gathered of it from Irish texts, did not differ from similar beliefs found, e.g., among American Indians and Negroes. The theory of the Druids, if it existed, was elusive: no classical writer ever discovered it fully; it exerted no influence upon classical thought. For the reason the theory of a connexion between Druidism and the Pythagorean system must be rejected, though again we must not overlook the fact that Greek philosophic teachings may have penetrated to some of the Druids, or the Massilian colonies. Probably the origin of this fancied connexion is to be found in the fact that the Druids taught a future existence in the body, and that they had myths, such as are found in the Irish texts (see CELTS, § XVI.), regarding transmigration. It was at once assumed that there must be a link between these Celtic beliefs and the Pythagorean doctrine of metempsychon. There are, however, very real differences. The Druidic doctrine of immortality was not necessary to immortality in the sense held by Plato, for, though Pliny does not regard them as philosophers, his description of the mistletoe rite suggests their priestly functions. Pliny’s acquaintance with the Druids seems to have been superficial, but his description of the mistletoe rite suggests their priestly functions, though here and in other passages he associates these with magico-magical rites (II. xxiv. 83, xxiv. 12, xxx. 1). This difference in these opinions shows that a closer practical acquaintance with the Druids revealed their true nature to the Roman Government, which found them more cruel and licentious and superstitious than philosophic. For these reasons, and on account of their hostility to Rome, the latter broke their power systematically (see below, § 12). Thus, it is unlikely that the Druids were reduced to a kind of medicine-men to gain a livelihood (D’Arbois, 77). Pliny’s phrase, Druidas . . . et hoc genus eutum medicorumque, appears to refer rather to their position before the Roman influence and to the fact that they may have been different. Among them—some priests, some diviners, and some practising a primitive medical science. Pliny’s acquaintance with the Druids seems to have been superficial, but he was the first writer to give a correct account of the primitive magical practices belonged to them from the first, and were not the result of Roman suppression. On the other hand, it is probable that the Druids were not the original founders of the whole Celtic area. But the opinion that they were the slyy philosophs seems to have been repeated by a series of
connected with their practice of divination and magic, their human sacrifices, and their belief in the power of ritual.

5. The Druids as teachers. — To the Druids, says Caesar, a great number of the young men flocked for the sake of instruction; but the next paragraph (14) suggests that it was the privilege of exemption from military service and from tributes that encouraged them to go to them of their own accord for instruction, or to be sent to them by parents and relatives. Whatever the reason, the fact that the Druids were teachers cannot be doubted; but, since their course of instruction lasted 20 years, some of their pupils were probably under training for the priestly life rather than for general instruction. The Irish texts show that the insular Druids were also teachers, imparting 'the science of Druidism (druidlech) to as many as 100 pupils at one time, while they also taught the daughters of kings, as well as the fabulous heroes of the past like Cuchulain (Jos. Antiq. 1, 10, 3; Trip. Life, 99). Caesar writes that the subjects of knowledge were the doctrine of immortality, 'many things regarding the stars and their motions, the extent of the universe and the earth, the nature of things, and the manner of the immortal gods (vi. 14); and verses, never committed to writing, were also learned. Strabo (loc. cit.) also speaks of their teachings in 'moral science.' The teaching of immortality had a practical end, for it was intended to rouse men to valour and make them fearless of death. Their scientific teaching was probably connected with magic and divination, and doubtless included many cosmic myths and speculations; their theology was no doubt mythological — stories about the gods such as are found in the Irish texts; their moral teaching was such as is found in most barbaric communities. An example of it is handed down by Diogenes Laertius (proem. 5): 'The Druids philosophize sententiously and obscurely — to worship the gods, to do no evil, to exercise courage.' Ritual formulæ, incantations, and runes would also be imparted. These last may be the verses to which Caesar refers, but they probably also included many myths in poetic form. They were taught orally, in order to keep them from the common people (a curious reason, as the common people could not read), and in order to exercise the memory. The oral transmission of the Vedas is a parallel with this. Writing, however, was known, and the Greek chronographers mention having used this method to a wide region. Perhaps there was also a native script, and the ogham system may have been known in Gaul as well as in Ireland, if we may judge by the existence of the god called Ogmos (see CELTS, § V.). The Irish Druids appear to have had written books, to judge from an incident in the life of St. Patrick (Trip. Life, 284). Beyond what Caesar says of the verses kept secret from the common people and consisting of incantations and myths, there is no evidence that the Druids taught some lofty esoteric knowledge, some noble philosophy, or some monotheistic or pantheistic doctrine. The secret formulæ were kept secret save to the initiated, lest they should lose their magical power by becoming too common, as in the parallel cases of savage and barbaric mysteries elsewhere.

6. Religious functions of the Druids. — The Druids 'take part', says Caesar, 'in most public and private sacrifices, and expound the principles of religion' (Caisar, vi. 13). Their priestly power being so great, the Druids would let no important event pass without their sanction. All details of ritual—the chanting of runes, the formulæ of prayers, and the offering of sacrifices—were in their hands; in a word, they were mediators between the gods and men. Every known form of divination was observed by them, and before all matters of importance their help in scanning the future was sought (Caisar, vi. 16). As to sacrifices, none was complete 'without the intervention of a Druid' (Diod. Sic. v. xxxi. 4; cf. Caisar, vi. 16). This was probably also the case in Ireland, though little is said of sacrifices in the Irish texts; we are, however, to infer from the sacrificial rites described by the authors of the sacrifices at Tara (D'Arbois, Cours de litt. Celt., Paris, 1885, i. 155) and at the Beltane festival (Cormac, Gloss., ed. Stokes, in Three Irish Glossaries, London, 1862, n. v.) that the cruel sacrifices of the Druids horrified the Romans, and this largely discounts the statements about their philosophic doctrines. An instance of their power is seen in the fact that those who refused to obey their decrees were interdicted from all sacrifices—a severe punishment in the case of so religious a people as the Gauls (Caisar, vi. 13 and 16). The Druids played an important part in the native baptismal rites, which were named Plynings (see BRITAIN [Ethnic], § 7), and also in all funeral ceremonies. At burial, runes were chanted, and sacrifices were offered by the Druid, who also arranged all the rites and pronounced a discourse over the dead. The Druids also arranged the various magical formulae, incantations, and prayers. Besides this, they who knew the language of the gods (Diod. Sic. v. xxxi. 4) probably claimed to be incarnations of these gods, in this way escaping the punishment of those earlier priests-kings upon whom the order of the universe depended. With the differentiation of king and priest some of the Druids may have been invested with such divinity, although in Ireland it was still apparently attributed to kings (see CELTS, § VIII.); but this may not have deterred the Druids from claiming similar powers. Such divine pretensions would accord with the claim of the Druids to have created heaven, earth, sea, and sun (Antiqua Laws of Ireland, Dublin, 1865–1901, i. 221), while it would also explain the superiority of their rank over that of kings as alleged by Dio Chrysostom and discovered in Irish instances (see § 9).

7. Medical and magical practices. — Pliny's words, Druidus et hoc genus satis medicorvum, may suggest that the Druids practised the healing art, or that a special class attached to them did so. It is hardly applicable to a wide region. Perhaps there was also a native script, and the ogham system may have been known in Gaul as well as in Ireland, if we may judge by the existence of the god called Ogmos (see CELTS, § V.). The Druids appear to have had written books, to judge from an incident in the life of St. Patrick (Trip. Life, 284). Beyond what Caesar says of the verses kept secret from the common people and consisting of incantations and myths, there is no evidence that the Druids taught some lofty esoteric knowledge, some noble philosophy, or some monotheistic or pantheistic doctrine. The secret formulæ were kept secret save to the initiated, lest they should lose their magical power by becoming too common, as in the parallel cases of savage and barbaric mysteries elsewhere.

The Druids 'take part', says Caesar, 'in most public and private sacrifices, and expound the principles of religion' (Caisar, vi. 13). Their priestly power being so great, the Druids would let no important event pass without their sanction. All details of ritual—the chanting of runes, the formulæ of prayers, and the offering of sacrifices—were in their hands; in a word, they were mediators between the gods and men. Every known form of divination was observed by them, and before all matters of importance their help in scanning the future was sought (Caisar, vi. 16). As to sacrifices, none was complete 'without the intervention of a Druid' (Diod. Sic. v. xxxi. 4; cf. Caisar, vi. 16). This was probably also the case in Ireland, though little is said of sacrifices in the Irish texts; we are, however, to infer from the sacrificial rites described by the authors of the sacrifices at Tara (D'Arbois, Cours de litt. Celt., Paris, 1885, i. 155) and at the Beltane festival (Cormac, Gloss., ed. Stokes, in Three Irish Glossaries, London, 1862, n. v.) that the cruel sacrifices of the Druids horrified the Romans, and this largely discounts the statements about their philosophic doctrines. An instance of their power is seen in the fact that those who refused to obey their decrees were interdicted from all sacrifices—a severe punishment in the case of so religious a people as the Gauls (Caisar, vi. 13 and 16). The Druids played an important part in the native baptismal rites, which were named Plynings (see BRITAIN [Ethnic], § 7), and also in all funeral ceremonies. At burial, runes were chanted, and sacrifices were offered by the Druid, who also arranged all the rites and pronounced a discourse over the dead. The Druids also arranged the various magical formulæ, incantations, and prayers. Besides this, they who knew the language of the gods (Diod. Sic. v. xxxi. 4) probably claimed to be incarnations of these gods, in this way escaping the punishment of those earlier priests-kings upon whom the order of the universe depended. With the differentiation of king and priest some of the Druids may have been invested with such divinity, although in Ireland it was still apparently attributed to kings (see CELTS, § VIII.); but this may not have deterred the Druids from claiming similar powers. Such divine pretensions would accord with the claim of the Druids to have created heaven, earth, sea, and sun (Antiqua Laws of Ireland, Dublin, 1865–1901, i. 221), while it would also explain the superiority of their rank over that of kings as alleged by Dio Chrysostom and discovered in Irish instances (see § 9).

Medical and magical practices. — Pliny's words, Druidus et hoc genus satis medicorvum, may suggest that the Druids practised the healing art, or that a special class attached to them did so. It is hardly applicable to a wide region. Perhaps there was also a native script, and the ogham system may have been known in Gaul as well as in Ireland, if we may judge by the existence of the god called Ogmos (see CELTS, § V.). The Irish Druids appear to have had written books, to judge from an incident in the life of St. Patrick (Trip. Life, 284). Beyond what Caesar says of the verses kept secret from the common people and consisting of incantations and myths, there is no evidence that the Druids taught some lofty esoteric knowledge, some noble philosophy, or some monotheistic or pantheistic doctrine. The secret formulæ were kept secret save to the initiated, lest they should lose their magical power by becoming too common, as in the parallel cases of savage and barbaric mysteries elsewhere.
magicians, and their practices included shape-shifting and invisibility, control of the elements and the weather, the producing of fertility, the use of all kinds of spells, and the causing of sleep, illness, and death (Convicitlanitis & see Cicero, § XV.). Though it is possible that the Druids of Gaul may have been more advanced than those of the islands, it is most unlikely that they did not also possess magicians, and it is more than likely that it is this side of their functions to which Suetonius refers when he speaks of the ‘savage’ nature of the Druidic religion; or Pliny, when he calls the Druidi magi (viii. ii. 11) or gens estum nociconstique (xxx. 1), or Posidonius, when he says (in Diod. Sic. v. xxxi. 5) that ‘they tamed the people as wild beasts are tamed’. How far is this from the attributing of a lofty philosophy to the Druids? Moreover, the wide-spread use of human sacrifices among the Druids of Gaul makes it extremely probable a priori that they were also wielders of magic, while, as we have seen, they certainly did ‘dis. des gesta’.

8. Druidic organization.—The enormous power wielded by the Druids both in religion and in politics, as well as the privileges which they claimed, makes it evident that they were a more organized body than the Romans imagined; and this conclusion receives support from the fact that they had fixed annual meetings in Gaul (see below, § 9), and that, as Caesar (vi. 13), there was one chief-Druid wielding authority over all the others. On the death of the chief-Druid, he who had pre-eminent dignity among the others succeeded to the office; but, if there were several of equal rank, the selection was made by vote, while sometimes they even contended in arms for the presidency. Though there were Druidic families, the priesthood was not necessarily hereditary, since, as has been seen, entrance to it was permitted after a long novitiate. There is no direct evidence that the insular Druids were similarly organized; but, in spite of the denials of some recent writers, the fact that there were chief-Druids in Ireland is seen from the texts, and such a chief-Druid, primus nautas, summoned the others together when necessary, e.g. against St. Patrick (Trip. Life, ii. 325).

A passage of Timagenes, cited by Ammianus Marcellinus (xv. ix. 8), and connecting the Druidic organization with the authority of Pythagoras, speaks of one of the Druids as sodalicis adstridis consortis. This points to them as a religious corporation (sodalicium), and perhaps as dwelling in convocilic communities, which is to be taken in that sense, which is not certain. Caesar says that the other hand, who gives the fullest account of them, says nothing of communities of Druids, and the passage of Timagenes may simply be an exaggeration due to the fact that they had some kind of organization or that there were Druidic families, and to a supposed following of the Pythagorean associations by them. The theory has, however, been revived by H. Reber (Z. f. deut. Kultur, vii. 332), who maintains that the Druids lived in communities like the Tibetan or Christian monks, devoted to abstruse studies, and that the Irish monastic system was simply a Christian transformation of this Druidic community life. The Irish have more support to this view; on the contrary, there are numerous references to the wife and children of the Druid; nor is it likely that the Druids, in all cases hostile to the Christians, would have married into Christian monks. The Irish monastic system was formed on Continental models, and owed nothing to paganism, etc.

9. Political and judicial functions of the Druids.—The political power of the Druids would certainly be augmented by their position as teachers; and, though in individual cases it may have owed much to a commanding personality, the evidence leaves little doubt that it was exercised officially. Rulers and chiefs were apparently elected by their choice, and Caesar (vii. 35) speaks of the magistrate whom they chose as ‘the chief of his nation’, which office, he says, had been elected by the priests ‘according to the custom of the State’. It was evidently a customary power which was thus exercised. In Ireland the Druids also interposed in the choice of a king. They sang verses over a sleeping man who had been fed with the flesh of a white bull slain perhaps as a sacrifice; the runes being ‘to render his witness truthful’. The man then dreamt of the person who was to be king, and saw where he was and what he was doing at the time. When the man awoke, the subject of his vision was elected king (Windisch, Il. Tezze, i. 215). Perhaps the Druids hypnotized the man and suggested to him the person whom they desired to be elected. We have no evidence as to the method of election in Gaul. Dio Chrysostom (Orat. xlix.) says of the Druids that kings were their ministers and servants of their thought, and could do nothing apart from them; and, although his witness is late and may be exaggerated, it receives corroboration from the Irish texts, in which the king is always accompanied by his chief Druid, and the two are by no means considered as equal. Moreover, a singular passage in the Tain Bo Cálainge (Windisch’s ed. p. 672 f.) shows King Concho bar giving no response to the blinder of important tidings until the Druid Cuchulain had spoken to him. ‘For such was the rule in Ulster. The men of Ulster must not speak before the king, and the king must not speak before his Druids’ (Antient Laws of Ireland, i. 22). The political power of the Druids, though great, is closely paralleled by that of other priesthoods, and may have served to keep in check the position of the warrior class. They frequently intervened in combats, and by their exhortations made peace (Diod. Sic. v. 31. 6), even when two armies were about to join battle. This probably refers to inter-tribal warfare. As to their judicial functions, Caesar (vii. 13): ‘They are held in great honour, for they decide generally regarding all disputes, public and private; and, if any crime has been perpetrated, or a murder committed, or if there be a dispute about property or about a boundary, they decide it. If any one, whether a public or private case, be submitted to their decrees, they interdict him from the sacrifices.’ Such interdicted persons were regarded as criminals, and all shunned contact with them; in effect they were tabu. Caesar also adds that they met in the voting place, and were a pure spot in the territory of the Carnutes, the central district of all Gaul, and thither came all who had disputes and submitted to their judgments. Caesar may be referring to a bygone past rather than to existing practice, since he himself mentions disputes not settled by Druids, while nothing is said regarding any obligation to refer to Druidic judicature. That judicature was, however, founded, and its judgments were upheld on magico-religious grounds. It is possible that the immolation of criminals taken in theft and other crimes was a punishment ordered by the Druids (Caesar, vi. 18), who no doubt had no support to this view; on the contrary, there are numerous references to the wife and children of the Druid; nor is it likely that the Druids, in all cases hostile to the Christians, would have married into Christian monks. The Irish monastic system was formed on Continental models, and owed nothing to paganism, etc.
Druids.

... of the Gauls and those of Ireland are perhaps more apparent than real. We know the certain facts about the Druids; the latter, only from Christian observers, or from documents which have passed through Christian hands; and it is probable that Christian influences may have endeavour to reduce the Druids to the lowest post of mere priests.

Stress is sometimes laid upon the supposed lack of judicial functions and of organization among the Irish Druids, but it has been difficult to account for this discrepancy. More vital still is the assertion that the Irish Druids were only magicians and philosophers. If a sacred fire at a Druid festival was said to indicate certain verdicts, the characters on the wooden spindles were called fadid or fadill and were considered to be the “pythones” or his Druidism came to Gaul from Britain, the Druids were able to assume judicial functions there. D’Arbois (p. 103) thinks, however, that the exercise of such functions by early Christian clergy in Ireland may be traced to the fact that the pagan priests had a judicial position, and, if the fadid were a Druidic class, they would then be carried on the Druids.

The early Irish and Gaulish Druids.—The often-quoted differences between the Druids of Gaul and those of Ireland are perhaps more apparent than real. religious functions among the Celts must be set against his
eccentricity. Though the Druids may have been an organization of
priests, and, though there were no "Druides" in Britain beyond the
Roman pale, and in Ireland, entirely to the introduction of Christian-
ity and the opposition of the Christian priesthood. Rome did not attack
the Druids on religious grounds, strictly speaking, but (c) on political
grounds, because the Druids had such power in politics and in the adminis-
tration of justice, and opposed the majesty of Rome; (b) on
grounds of humanism, because the Druids offered human sacrifices;
and, finally, (d) because of the magical superstitions. But this oppor-
tunity implied little more at first than the application of existing
laws against these things. Augustus prohibited Roman citizens from
taking part in the religion of the Druidarum (Suet. Claud. 29); and Pliny
(xxx. 1) asserts that Tiberius interdicted 'the Druids and that race of
prophets and doctors,' though it is probable that this was no more than putting into
force what laws were already in force. After this it meant a suppression of the Druids as such, it
entirely failed of its object; for they were still active in the reign of Claudius, who completely
abolished the cruel religion of the Druids ('Druid-
arium religionem apud Gallos dirae immortalitatis, et
tantum civibus sub Augusto interdictam, peninus
abolevit,' Suet. Claud. 25). Here it is doubtful whether more than an abolition of human sacrifices and
magical practices was intended, for Claudius,
but to death a Roman citizen of Gaul for appearing in
court with a Druidic amulet, the so-called ser-
pent's egg (Pliny, xxix. 3), and Aurelius Victor
says that Claudius merely abolished the 'notorious
superstitions' of the Druids (de Caesar. 4). The
Druids were still in existence at a later time, the
native religion still went on, and Mela (iii. 18)
expressly says that human sacrifice was commuted
to a little harmless blood-letting. The actual
disappearance of the Druids was undoubtedly due
to less to such laws than to the Romanizing of Gaulish
religion begun under Augustus, and to the institu-
tion of the Pagani, at whose sacrifice the Druids
were replaced. Whether the Druids were still allowed to assemble
yearly at the consecrated place in the territory of
the Carnutes (Cass. vi. 13) is doubtful, but they
would certainly not be allowed to act as judges;
and the assembly of the Druids at the Buttington
towns of the three Gauls at Lugdunum (Lyons)
round the altar of Augustus, with its obviously
religious character, was probably intended to take
the place of that assembly. 'A flames of the
province was elected by the deputies, and there
were flamen for each town. If the Druids wished
to be recognized as priests, they would have to
become priests of the new Gallo-Roman religion.

Their position as teachers and secretaries attacked by
the establishment of schools, as at Autun, where
sons of noble Gauls are found receiving instruction
as early as A.D. 21 (Tac. Ann. iii. 43). Thus,
by almost ignoring of the Druids, and as well as by
the direct attack upon certain of their functions, the
Roman power gradually took away from them their
occupation as native priests. D'Arois (p. 73),
however, makes no reference to such a flight, and
refers merely to the resumption by the Druids of
their rites and teaching in forest glades where they
dwell, not where they hid themselves, after Caesar's
war, and he makes no reference to what took place
after the laws against the Druids. Mela (i. 19), though writing in Claudius' reign,
does not appear to refer to secret teaching as a
result of the laws, but, other amplifying Caesar's
words or citing Posidonius, says that the Druids
were taught the son of noble families during a period of
twenty years secretly in caverns or forest depths.
He has obviously confused the twenty years' novitate of some who intended to become Druids
with the teachers given to others. The secret forest recusary were simply the consecrated groves
where Druidic rites were carried on. There the
Druids may have continued to teach, but probably
the sons of noble families took advantage of the
Roman schools. This teaching would be permitted by
Rome, so long as the Druids did not interfere
in politics or practise human sacrifices. Moreover,
Mela does not appear to hint that the commutation
of human sacrifice by human sacrifice was
for the part of the still permissible Druidic religion.
Those who practised the forbidden rites would certainly
be liable to punishment, but probably the bulk of
the Druids succumbed to the new order of things.

But Druids were not exterminated, and perhaps
took a prominent part in the revolt against Rome,
while some prophesied a world dominion for
the Celts at the time of the burning of the Capitol
at Rome in A.D. 70 (Tac. Hist. iv. 54). The mistletoe
and herb rites of the Druids described by Pliny
may have still existed in his day; but he may be
referring, like Lucan, to a former state of things.
After this date the Druids seem gradually to have
disappeared in Gaul and S. Britain, and were
remembered only as philosophers. But even in
the 4th cent., as the verses of Ausonius show
(Prof. v. 12, xi. 17), men counted it an honour to
have a Druid for an ancestor.

In independent Britain, Druidism remained as it
had been (cf. Pliny, xxx. 1), and after the evacu-
ation of Britain by the Romans the Druids seem
have reappeared south of the Roman wall.
Nennius (Hist. Brit. 40) describes how Vortigern,
after being excommunicated for incest, called
together his 'wise men' (magni, tr. 'Druids' in
the Irish Nennius), who advised him to offer a human
sacrifice at the building of a fortress. But neither
in Christian nor in pagan Britain could the Druids
withstand the growing powers of the Christian
clergy. The lives of Celtic saints show how the
Druidic magic arts were equalled and surpassed by
the miracles of the saints, and how they were
evitably overcome, as is vividly seen in the
encounters of Columba with the Druids in the
north of Scotland, described by Adamnan.
Similarly in Ireland, Christianity also destroyed the
Druids; and the Lives of St. Patrick, who com-
bated the 'hard-hearted Druids' (Winne-les, Fr.
Texte, i. 23), and other Lives of saints, are full of
the magical claims and wondrous deeds by which
the heathen priests were discomfited. The victory
of Christianity over the Druids was, in popular belief,
accomplished by a more powerful magic; but, at
the same time, though the Druids passed away,
many of their beliefs remained among the people
as superstitions to which, perhaps, they attached
great importance as to Christianity (cf. Reeves' ed. of
Adanaan, Vita S. Columbae, Dublin, 1857;
D. J. O'Sullivan, Three Irish Lives, 1876; Stokes,
Irish-Celtic Saints, Dublin, 1857; D. J. O'Sullivan,
Antient Lives of Ireland, i. 15).

Monument, Rom. Gesch., Leipzig, 1859, iii. 237, v. 94 f.; A.
DRUMS AND CYMBALS

The drum is a musical instrument of the percussive class, consisting of a hollow cylindrical or hemispherical frame of wood or horn, with a "head" or tightly stretched membrane at one or both ends, by the striking of which and the resonance of the cavity the sound is produced. This definition literally includes two objects, the head and the drum. The term "head" has two meanings: either the convex, or the concave, side of the membrane. The actual genus of the membrane-drum cannot be traced, though some speculations have been made on the suggestive analogy of various temporary drums and drum-substitutes. Clearly, like two components, it has been independently invented by a fair proportion of the races of mankind.

Methods directly or indirectly suggestive of drumming are either obvious or recondite to civilized experience. The Veddas have no musical instruments of any kind. In their dances they mark the rhythm by beating with the hands, their chests, flanks, or bellies. The Andamanese women beat the drum with their hands by slapping the hollow between the thighs, or pressing it on the head with the palm of the right hand, which is held at the wrist by the left. This method is common in many civilisations, and the women invariably form the orchestra. This method is analogous to the drum method of the bellicose cat; the same drum made of the belly of a deerskin, or the head of a calf, used by the Veddas in India, and a hymn in the Atharvaveda celebrates its praises. The earliest record of the use of the drum is in ancient music. In the structural variations presented by the instrument, there are types clearly marked.

Among historical peoples the drum is of very great antiquity. Its invention belongs to their history: its forms are the membrane-drum, the tambourine, and the kettle-drum. We shall only know it in the Vedic India, and a hymn in the Atharvaveda celebrates its praises. The earliest record of the use of the drum is in ancient music. In the structural variations presented by the instrument, there are types clearly marked. These are: (1) the incision-drum, a hollow cylinder, varying in length from a few inches to twelve or more feet, and in diameter proportionally. Made from a bamboo, internally or hollowed out, the ends are closed by the nodes or by the trunk section. A narrow longitudinal slit, of varying length, but generally nearly as long as the cavity, is made on one side of the drum. Its width in the larger instruments is about three inches. The tapering of the lips is important, for the drumstick is applied to them, and the tones vary according to the thickness of the substance struck. This drum may be placed either in a vertical or in a horizontal position. The best results are produced from the latter. (2) The stamping-drum is a long hollow cylinder, ending in one end, and having a cavity at the other, its diameter is greater than its length; the "head" of the closed end is either natural, as the node of a bamboo, or artificial, as a "membrane" of skin. This instrument sometimes has a handle, by which the closed end is struck on the hard ground. (3) The single-headed membrane-drum is a wooden cylinder, whose length is not much more than its diameter. The tightly stretched membrane of hide is beaten with the fingers, the hand, or a stick. The stick, usually knobbed, sometimes of a hammer-shape, becomes a heavy-headed club for the larger drums. The other end of the drum is closed. (4) The double-headed membrane-drum is the single-headed with the closed end removed and converted into a "head." This drum is placed in a horizontal position and both heads are used.

The fricton-drum is (3) or (4) with a thong or cord stretched across the diameter of the hide (one head in the case of the double-headed drum), or along its radius, being fixed in the centre. A

The Buchanan, who are the finest leather-makers in Northern Africa, use it for making the "head" of the memora. An ox-hide is held and tightly stretched by several men. This is beaten with sticks. The process is a musical one, in skin-preparation, here employed to produce ceremontal music. In old days the Chippewas made their war-drum by stretching sticks in the ground, and binding them in place by means of strong hoops. Covering a pot or clay cylinder with a head of skin is a common method of making both permanent and temporary drums. The latter was supported against the drummer's body and played with both hands. Such an instrument is represented in a relief of Ashurbanipal (685-629 B.C.), in which women and children are playing their hands.

Certain peoples representing the lowest stages of culture known have failed to invent the drum, but in savagery generally, in all the stages of barbarism, in all civilisations like that of the Veddas, its use corresponds with its importance as the chief, and sometimes the only, instrument of music. The structural variations presented by the instrument are endless, but the types are clearly marked. These are: (1) the incision-drum, a hollow cylinder, varying in length from a few inches to twelve or more feet, and in diameter proportionally. Made from a bamboo, internally or hollowed out, the ends are closed by the nodes or by the trunk section. A narrow longitudinal slit, of varying length, but generally nearly as long as the cavity, is made on one side of the drum. Its width in the larger instruments is about three inches. The tapering of the lips is important, for the drumstick is applied to them, and the tones vary according to the thickness of the substance struck. DRUMS AND Cymbals

The Buganda drum was made from a section of tree-trunk, conical in form; the base of the cone alone was open. This was headed with a cowry shell, and this was the orifice for the slit. Some were ten inches high, others five feet, and four in greatest diameter. Some were beautifully decorated with carvings and heads. Except in the case of the very large drums, they were hung on posts, so as to get the full benefit of the sound. The skins were kept soft by being dyed with a mixture of goats' milk and water.

The essential character of the snare-drum and friction-drum is the presence of a string or thong of leather across the membrane or drum-head. A simple form is from British Guiana. A fine double drum, with a skin drum and a snare in the centre, passes across the membrane. Before it is drawn tight, an exceedingly slender splinter of wood is secured in the slip-knot, so as to rest on the membrane at right angles to the line of the thread. The head of the drum being unaltered, the instrument gives two different sounds. The friction-head produces, by the vibration of the splinter against the skin, a metallic sound. In another form the string extends along a radius only of the membrane. Such drums, besides producing different tones from the two heads, can be muffled by placing a wood beneath the string.

Small hand-drums are commonly used by various peoples.

The old English tabor is a type of these. The kettle-drum is not frequent. In the East the gong is preferred.

The Grock and Roman drum (tymbavos, symphuum) comprised two varieties of the tambourine type. The one was the flat tambourine; the circumference was hung with bells. The other resembled the lapp form, the under side being closed by a convex hemispherical bottom. This variety was also played with the hand like a tambourine.

The Heb. top (Gr. tymbavos, EY 'tabret,' 'timbrel') was another tambourine, probably without bells or rattles. The same Heb. word represents both the English, and probably there was only one form.

The tambourine, 'which was once among the chief instruments of the Lapland wizards, is now a great curiosity.' Two types were in use. One was a wooden hoop strengthened with two cross-pieces and covered on one side with reindeer-skin; the other was an oval box with a convex under side, lined out of a tree-trunk, and with a reindeer-skin head. In some there was a slit serving as a handle. Each tambourine had an 'indicator' (orpsi) consisting of a large iron ring, on which smaller rings were linked, for measuring the vibration by means of points to the symbols on the membrane. The hammer was made of reindeer-horn. The Lopars treated their tambourines with great respect, and kept them, with the indicator and hammer, wrapped up in fir. No woman dared to touch them.

Cook, Vagabond, 1870, p. 140; W. Ellis, i. 130, 145.

7 For various African drums, see Hobley, Ethnology of A.
pean, and the *nyengi*, a smaller kind resembling in shape two small cups of brass. The European type is derived from the Greco-Roman. These were a quarter or half-circles of metal with a handle. An older form is possibly indicated by the 'bronze vessels' used in the ceremonial dismissal of family *maasis* by the Roman *paterfamilias.* The Roman cymbals, however, without handles or provided with a knob or ring or metal handle; others had a hole for the insertion of a cord. The unfanged, early Semitic type was also known. The Khusians use cymbals in combination with drums. The Chinese drums have two disks, but only one pair of cymbals. The Abyssinians have tambourines, cymbals, and various drums. In modern European orchestras they hold a not unimportant place.

Only in the case of one people, the Hebrews, have cymbals attained independent importance. They were employed in dances and singing with the *zophah*, but in the Temple were used alone. The cymbals of the Hebrews (םֶשֶלֶפֶת, *sellephet*, ֶדֶלֶפֶת, *delphet*) were used in the temple-worship to mark time for chants. They were hanging cymbals, held one in each hand, and clashed together. *Sellephet* is used only in 2 S G 6 and Ps 159. In the latter passage the epithets 'bold' and 'high-sounding' are applied. It has only been proposed, therefore, that the sellephet were the conical flanged cymbals, as used by the Assyrians, giving a muffled sound, to be distinguished from *delphet*, cannot refer to cymbals. According to the Mishnah and Josephus, one pair only was used in the Temple. It is not likely that *sellephet* and *delphet* are ever confused, though the terms *sellephet* and *delphet* is possible. In the case of the Temple cymbals one disk was fixed, and was beaten by the other like a clapper. In later Mishnai the cymbal worn is in the singular number. The cymbalists were Levites. In the Second Temple a special order of Levites had charge of the cymbals, which are stated to have been of great antiquity. Their sound is described as high, loud, and far-carrying. It has been suggested that the 'tinkling cymbal' of *St. Paul's simile implies the metallic spheres worn on bracelets and by courtesans on their belts. This again implies better the epithet than the cymbal.

The use of the drum as an instrument of society, and probably the art itself of drum-playing, have their highest development in Africa. The only national instrument that can employ the drum of the African is the pipes of the Scot. But the skill with the drum is more widely diffused among the Africans. Uganda in the old days supplies a typical example of a drum-conducted community.

The twenty drums of the Baganda were the royal family, or, *gaga*, ninety-three in number. Fifty-one of these were small. They were guarded by a chief, *kakala*, and his assistant *kakala* (who, in one case, was a month's revenue each year in the royal court for beating the drums. A priest was put in charge of the drums. The number of totem-clans had each special drums; the leading members determined the expense. Every chief, besides his drum of office, had his private drum. This was beaten at times to summon his permanent holding of office. Each clan had a special rhythm which was recognized.

Drum-playing calls for considerable executive skill, particularly on account of the rebound of the membrane. It is in the utilization of this rebound that the essence of the drummer's art consists. Even with the heaviest drums no great force is required. The weight of the blow varies as the thickness of the membrane. In the case of large incision-drums, where the body serves as a membrane, the drum head is tapped, and very resonant notes are produced by the use of a light stick. Various forms of drum-stick have been mentioned incidentally.

The Baganda drummer used two short but heavy sticks, club-shaped. The vibration from the large drums was so great that a man who did not understand how to beat them might have his shoulders dislocated by the rebound of the leather when struck. Music could be got from these drums, so much so that any one a man could vocally sound and not some other instrument, was being played. In the New Hebrides big wooden flutes are used for beating the largest incision-drums, the drumming is supplied by small horizontal incident-drums. These are beaten in 'brisk syncopated time, to the loud booms of the bigger drums.'

For the psychological study of music by which the social and religious importance of the artistry of sound is dissipated to be excluded. In drums and cymbals supplies unique data, and the drum-music of such races as the Central African, the American Indian, and his congener the Northern Asian (the Melanesians are, artistically, in a lower class) forms one of the most indispensable documents.

The fact is that the music of the drum is more closely connected with the foundations of aurally generated emotion than that of any other instrument. It is complete enough in itself to cover the whole range of human feeling, which is not the case with its subordinate, the cymbals, while it is near enough to the origins of musical inspiration to appeal most strongly to the primitive side of man's nature. The investigator will need a long experience and adaptation to the atmosphere in which the vibrations of drum and tambourine produce their effect, and that it is only as an exploring did, the orchestral drum-music of negroes to 'the raging of the elements let loose,' is no longer an explanation of primitive music. To put it briefly—the emotional appeal of music is to a very large extent muscular. Rhythm is practically a neuro-muscular quality, and it is the fundamental form of musical sound. Most of our emotions tend to movement. Harmonious rhythm in movement and action is the soul of society, as it is the soul of the dance.

In all primitive music, rhythm is strongly developed. The pulsations of the drum and the sharp crash of the rattles are thrown against each other and against the voice, so that it would seem that the pleasure derived by the performers lay not so much in the tonality of the song as in the measured sounds arranged in contrasting rhythm, and which by their clash start the nerves and spur the body to action, for the voice which alone carries the tone is often subordinated and treated as an additional instrument. Helmholtz observed: 'All melodies are rhythms. Graceful rapidity, grave procession, quiet advance, wild leaping, all these different melodies, called songs, are produced by variations of tones. And, as music expresses these melodies, it gives an expression also to these mental conditions. It is true that we cannot say whether of the body and the voice, or of the thinking and feel -ing generates itself.'

To increase muscular power the strongest stimulus is muscular movement; to produce emotional intoxication the combination of muscular movement that is rhythmic with rhythmic sound or motor translation into music is the most efficient. One great sphere of drum-music has been the social emotions. Not only military, religious, and sexual excitement, but every possible form of social organization has been fostered and developed by its influence. It is a significant coincidence that the boom of the modern cannon and the boom of a primitive drum mean war. In contrast to this large, impressive sound, which is so essentially organic in its nature and its production, may be placed the exclusively religious use of cymbals by the Hebrews, and the prominence of cymbal-music in the perverted sexismman.
of the cult of Attis. These two last cases are isolated phenomena. The music of the drum is more completely human.

The universal presence of the drum is made powerful by the very limitations of the instrument. The player is practically confined to rhythm, and the influential manipulation of this depends on his personality. He is one with his drum. It is this personal element that adds human meaning and will into sound that explains the so-called 'drum-language.'

Further, the player's muscular skill and muscular life are at their highest efficiency; he is for his hearers an instrument, a leader, and a prophet, the individual representative of the social body in movement and in emotion. It is on this principle that the drum in so many races gives the summons for all social functions. The blow of the drumstick translates itself not merely into sound but into spiritual reverberation, an impulsive stroke upon the social consciousness.

The meaning of drum-sounds is thus of a universal, undifferentiated character. They appeal primarily to the muscular sense, and secondarily to all that is built up on that foundation. An instance of the simplest possible application may be found in dances, where others dance or less elaborate:

Explanatory the route to spiritual-land is the soul of a dead chief, the Chippewas punctuate his words with sharp drum-taps, and so do the Jivaros. In this way drums are being played at an assembly, they are made to express and convey to the bystanders a variety of meanings. In one measure they abuse the name of another company, designating them as fools and cowards; then the rhythm changes, and the gallant deeds of their own company are extolled. All this, and much more, is conveyed by the beating of drums, and the native ear and mind, trained to detect and interpret each beat, is never at fault. The language of the drum is as well understood as that which they use in their daily life. Each chief has his own call or sound signified by a particular beat of his drum.4

Klark declares that 'the sound of the tambourine, the convulsive anthem of the shaman, his fierce screams, his wild stare in the dim light, all strike terror into the hearts of savages, and powerfully affect their nerves.' The character of this tambourine-music has been thus described: After some preliminary sounds such as that of a falcon or a sea-mew, which concentrate attention, the tambourine begins to make a slight rolling noise, like the buzzing of mosquitoes; the shaman has begun his music. At first it is tender, soft, vague, then nervous and irregular like the noise of an approaching storm; it becomes louder and more decided. Now and then it is broken by wild cries; ravens creak, geese laugh, sea-mews wail, and eagles scream. The music becomes leader, the strokes on the tambourine become coarser and more vigorous; the drum is raised high, and small tambors sound ceaselessly. It is a deluge of sound capable of driving away the wits of the audience. Suddenly everything stops; one or two powerful blows on the tambourine, and then it falls on the shaman's lap.5

To peoples like the Central Africans, the drum, apart from its directly emotional use in social gatherings, as an instrument of social initiation, plays the part of the church-bell, the clock, the town-crier, and the daily newspaper, besides being used for musical exercise and the exhortation of the sick.

In Africa (Lake Nyasa) the drum is used at dances, at feasts religious and secular, at wakes, by doctors at the sick-bed, by burying the dead, and in various ceremonies over the country.6 Among the Woodua Indians the drum is played when drink is given to either the guests at misti-drinking.7 Of the Baganda drums, Rowe writes: 'There was indeed perhaps to a multitude of men, quite apart from music; it was the instrument with which touched both joy and sorrow; it was used to let people know of the happy event of the birth of children, and it announced the meaning for the dead. It gave the alarm for war, and, the relation of the returning warriors who had conquered in war. It had its place in the most solemn and the most joyous ceremonies.' The royal drums were beaten to announce the coronation of a king, and his entry into a new house, and also at the new moon. Drums are carried on journeys and beseech the wanderers to encourage the walkers. A young man would beat the drum with his hands and sing meanwhile. 'The people when carrying loads, or when on a march, loved to be accompanied by the drum, and, if they had no drum, they sang songs, and set the time for marching by the drumbeat.'

Its co-operative and socializing importance is here well suggested. Its use as a muscular is that of a postal, telegraphic, and telephonic service.

The carrying power of these fine instruments renders communication very rapid. The big drum of the Anyanja can be heard at a distance of six miles.8 The Chippewa drum, which is not two feet high, can be heard at a distance of ten miles. As the drum-telephone is used to-day in Central Africa, it depends on an elaborated code which to one reared in the atmosphere is perhaps more dependent on social understanding and mutual recognition of 'tone-variations' than on a colourless translation of sounds into letters. At any rate, throughout a Central African tribe, the drum is a daily means by which the drum two or more villages exchange their news. Travellers, even Europeans, have obtained food and lodgings by its means.

The notes were anything but an easy matter to those natives in the speedily way it does? The drum-message system is found in New Guinea, and among the Jivaros of South America, the old Mexicans, and some Indians of the North-West. It is particularly developed in Oceania, the countries north-west and north-east of New Guinea, especially New Pomerania. Signalling by means of the incision-drum, but without any highly developed code, was used in Borneo, Java, the Philippines, New Zealand, the New Hebrides, Fiji, and the Harvy Islands.9

Throughout Melanesia, drums are part of a rich man's establishment. A chief will top them; these drums are fashioned into a grinding face. When the drum is an image of a venerated ancestor, the tape are made on the stomach. In Melanesia, ancestor-worship is linked to the civil and military authority of these instruments, half-drum and halfing. It is natural also for rulers and important persons to collect them as many sources of music as possible, though they may leave the more recent applications of supernatural power to the shamans. In the Upper Nile region the 'sacred' official drums hang in front of the chief's house, or under the sacred tree of the village. They are regarded with awe.10 The regalia of a chief are, as it were, his skeleton. These drums are also to be identified with the mysterious power of his office. In other cases, the drum may be regarded as the mouthpiece of a god or spirit, as containing the voice of the earth, or the god or the dead. The voice of the lower cultures, derives impressiveness not from stillness or humbleness, but from loudness and resonant power.

Some miscellaneous examples are appended of 1 J. Roscoe, 2 F. Hooper. 5, 57, 59.

1. The general use of cymbals in the worship of Dionysus and in the Eleusinian Mysteries belongs rather to the category of the impressiveness of noise, as such.

the beliefs and ritual connected with the sacredness of drums.

A third feature of Malay States includes the court and official drums, which are sacred. The royal drums of Jelub are said to be "holy", the skins of cows, and are ritually charged with a chord of twelve different sounds; the royal trumpet and the royal gong also emit the chord of twelve notes. The Sultan of Minangkabau possesses a drum of which he is the gager, and the royal gong. These drums are regarded as having come into existence when the Almighty cut them off from the skins of a royal bullock, which, according to the belief of the Malays, can only be cut with a knife. Any person who even 'brushed past them' would be forbidden to play drum to the royal music. In the Saters the drum is regarded as a holy object, and the "State drum", and powerful jemwul dwell in the other royal drums. Each drum in the palace of an Abyssinian king is a sacred object which is surrounded with a covering of sacred cloths. This drum had a protecting spirit, that, namely, of the slave who was sacrificed on it when it was made. It is beaten only at religious ceremonies.

Thus, the Polygenian god, was more or less represented by his sacred drum. These drums were often surrounded by carved housings; and possibly the evolution here is from drum to idol. While the drum retained its membrane, a connexion would be traced between its sound and the voice of the god. When the royal special drum, knute, of the Baganda received a new skin, the blood of the cow whose skin was used was run into the drum. Also a man was beheaded and his blood was run into it. The idea was that, when the drum was beaten, the life of the man added fresh life and vigour to the drum. When any drum was fitted with a new skin, the ox killed for the purpose also supplied the blood for pouring into the drum. Before a new skin was fitted the fetish was regarded as a necessity and the ceremony was regarded as the act of reinvigorating the palms of the African type. It was not every man who knew how to make a drum-fetish. A characteristic drum-fetish was that of the god of the drum. It was composed of portions of every kind of animal and bird husked; all kinds of metal were used making charges for hunting; miniature weapons, and pieces of cord used in making traps. This fetish was fixed upright in the drum.

In Abyssinian, and in the modern Salvation Army, has the drum found a place. Drums do not appear to have been used by the Hebrews in temple-worship. The usual drum, top, of the tambourine, is often present on their pulpits, and among the women, and to accompany religious music of a joyous and popular character.11 But in the great Oriental religions, particularly in Hindustan and Buddhism, the drum has an important place in the temple-worship; nor is it unknown in the worship of Islam. In lower cults the drum serves as a church-bell, an organ, and a direct vehicle of supernatural power.

The Baganda temple-drums were next in importance after the royal drums, and possessed all its particular rhythm and particular fetish. They were once the sound of the drum ganged on the new moon, warning the people of the monthly rest from work.2 In New Guinea the head-hunters also beat with their drums the ghosts of men slain in battle; in New Britain, to stop earthquakes.3 Demons are expelled by the South African drummers.4 In the Mozambique the drum is employed for the purpose of appeasing the gods causing difficult child-birth.5 In Central Africa demons are driven away with the drum from the sick,6 and by the drums, sceptres and drums are driven away to the music of drums.7 Greek historians record the 'disinfecting' of the sanctuary by Turkish shamans by means of the drum;8 and the use of it to drown the cries of children to Hobson.9 The Abu, or shaman, of the Haidaus undertakes to drive the evil spirits, if the shaman possesses the drum to cause spirits both to appear and to disappear.10

There is always something very human about the use of drum-music, even when applied to spiritualities. An Eskimo knows that drums are beaten softly when the traders' goods are brought in; loudly when the guns are brought, so that the shades of animals present may not be alarmed.11 For induction of spirits, the principle may be that of a summons of the fiends.

An old Motu-mota man observed to Chalmers: 'No drums are beaten uselessly; there are no dances that are merely useless.' The young men, for instance, are supposed to be kept out of the drum and dance that there may be a large harvest.12 The Papuan remark is as universal. Tahiti priests work themselves into an inspired state by dancing and beating their sacred drums. Each god has a special hymn accompanied by a special beat of the drum. On the ancient Israel the dance was preserved to the music of harps, psalteries, and cymbals.13 Among the Chaco Indians the drum is used in the drum dance and called drums,' from the fact that during this period the village drums are beaten incessantly day and night by relays of men.14 Among the Port Moresby natives (New Guinea) the boys at initiation have only one serious duty, which is for each to make his drum. They are taken, and live in the forest until the drums are completed; this may be a week or a month. Several boys go together. A straight branch is selected and cut to the requisite size; this is next screwed with shells till the orthodox shape is arrived at; finally, the cavity is carefully and laboriously burnt out. During the whole period they observe minute rules: if they were seen by a woman the drum would have to be destroyed, otherwise it would be certain to split, and would sound like an old woman's bundle.15 If they cut fish the skin of the drum will burst; red bananas cause a dull tone. They may not touch fresh water, but only that from the red banana, or cocoa-nut talk. Should they touch water inadvertently before the drum is hollowed out, they break it, crying: 'I have mistaken water, my forehead is wet, and I can never hollow out my drum.' The sorcerers instruct them that water extinguishes the 'fire' of the music; a fish

DRUNKENNESS

been tears the tympanum; and the sight of a woman destroys the tone.'

The basket-drum of some American tribes recalls not only primitive substituents for the drum, but certain features of agricultural rituals.

In their sacred rites the Navahos use an inverted basket in lieu of the drum. It is generally made of birch, with a piece of wood or bone fixed to each end of the rim. When inverted the basket is nearly hemispherical. During ceremonies it is beaten with the sacred drum-stick. This is made according to elaborate rules from the leaves of Yucca bacatta. The Navahos say, 'We turn the basket,' when they refer to the commencement of the song; 'We turn up the basket,' when a song is finished. As it is not connected with the incantation, to drive out the evil influence which the sacred songs have collected and imprisoned under the basket. It is no sacrifice to serve food in this sacred drum. To do so is common enough, but without ceremonial meaning. In Greco-Roman cults, such as the mysteries of Attis, eating sacred food from the sacred drum and cymbal was probably a reversion to primitive times, when platter, drum, basket, and winnowing-fan were interchangeable.

The use of the tambourine by the shamans of Northern Europe and Asia is remarkable. This instrument, and its shamanistic manipulation are found in the tribes already encountered by the world in northern parallels, through Asiatic Russia, Greenland, Northern America, and Lapland, and among the Amerindiens, Mongols, Tatars, and others. The structure of this hand-drum has already been described. Those used by the Tatars and Mongols have pictorial designs on the drum-head. The designs are supposed to produce or modify the sounds, and each, being thus a sort of word or sentence accompanied by pure sound, has its particular influence on the spirits who are invoked by the music.4 The Lapp shaman's drum has small brass rings fastened loosely on the head. These rings, or drums, or designs inscribed when the head is beaten with the hammer; and, according to their movements in relation to the magic signs of sun, moon, and planets, the shaman predicts the future. The origin of this method, which, it is to be noted, is always secondary to the musical or 'suggestive' use of the instrument, may be from the following practice: the Yakut shaman places a ring or coin on the palm of the inquirer's hand, moving it about in various directions, and then foretells the future. The Votyak tuna noved beans on a table for the same purpose.5

It is suggestive of hypnotism rather than of musical science that the drum is turned up while the hand is on it in front of the fire. A drumstick or the hand is used in playing. The tambourine plays the main part in the kamlante, the invocation of spirits and subsequent prophesying. The Chukohi shaman in his kamlante taps the tambourine with a piece of thin whalebone. The kam uses the tambourine in various ways, and produces the most varied sounds. The spectators recognize the various rhythms, such as the tramping of horses' foot, during which the kam is supposed to be riding with his guards. As he taps, he collects spirits in the tambourine. Sometimes during the course of the dance, the kam becomes so heavy that the kam bows under the weight.6

LITERATURE.—This is fully given in the footnotes.

A. E. CRAWLEY.

DRUNKENNESS.6—1. Definition.—Drunkenness has never been satisfactorily defined in a

legal or ethicial sense. In any attempt to define it legally, difficulties at once present themselves, and the judge has to reach his conclusions from the evidence. Drunkenness might in general, if not in scientific, terms be defined as that condition of mind and body produced by a sufficient quantity of alcohol (varying according to the susceptibility of the individual) to bring about distinct changes in the intellect, the emotions, the will (volition), the motor mechanism, and the functions of the cerebrum, or small brain, indispensable to the accentuation of any movement. On the various stages and symptoms of intoxication, and forms of alcoholism, see art. ALCOHOL. (vol. i. p. 300.) The definition of 'habitual drunkard' first appeared in the Habitual Drunkards Act of 1878. It runs as follows:

'a person who, not being amenable to any jurisdiction in lunacy, is, notwithstanding, by reason of habitual intemperate drinking of intoxicating liquors, at times dangerous to himself or herself, or to others, or is incapable of managing himself or herself, and his or her affairs.'7

2. Racial degeneration: heredity.—Of great moment as individual and family wreackage wrought by drunkenness is in a large measure the injury done to the offspring. About this degeneracy, until quite recently, there has never existed a doubt. The all but universal testimony of competent observers and of the medical profession all over the world, based upon extensive inquiries, and an impartial exposition of the opinions of the profession on the question remain to this hour unshaken. And it may be said at once that these impressions as to bodily, nervous, and mental degeneration are not to be lightly set aside by any conclusion or opinion based upon the very restricted investigation by one or two authorities, however eminent. In 1910 the Galton Eugenics Laboratory issued two papers by Professor Karl Pearson on the influence of parental alcoholism on the physical health and mentality of the offspring. These papers were supposed to set forth lax and subjective views on the subject of temperament—views which, if capable of proof and acceptance, would indisputably have given a decided set-back to the believed and accepted doctrines of clinicians, and of scientific men and of social reformers in every land, as to the undoubted racial degeneration of the alcoholic individual and his or her offspring. If the first dictum of these observers, to the effect that on the whole in regard to degeneration the balance turns as often in favour of the alcoholic as against the non-alcoholic, could be upheld, the outlook for the nation could not be otherwise than ominous. These opinions, apart from their calamitous effect on the race, shocked orthodox believers in the classical view of the hereditary hold, and Sir Victor Horsley and others entered the lists in its support. If Professor Pearson and his collaborators could have established their proposition to anything like the extent to which their opponents have established theirs, it would have to be seriously entertained, no matter what might be the consequences to society and the race. But they have not done so, and it is not much to the point for them to impugn the investigations of their opponents on the ground that no trouble was taken to ascertain whether the alcoholism or the parentage came first. Indeed, the same charge of laxity of methods of investigation must be brought against Professor Pearson's inquiry. For the 'Preliminary Study of Extreme Alcohollism in Adults' is based on reports made in connection with a very restricted investigation. In any study, whether aiming for or against, some fixed and definite standards are needed by which all cases can be tested. Such would have averted the confusion, the intoxicants used by different races, etc., will be found in the art. Drunks, DRINKING. Cf. also the art. ALCOHOL.
fleeting meanings attached to the terms 'drinking' and 'sober' applied to masses of the population. Many excessive drinkers are never 'drunk,' and many have a reputation for sobriety who consume in one debach as much as the man called a 'drunkard.' An apparent injury to themselves and others. Hence the need for rigid definitions and limitations applied to investigations which, to be of value, would require to be of a comprehensive character, and extended over a series of years. The effect of the 'Study' however, is to demonstrate the close connexion between alcoholism and mental defectiveness, but the question is left unsolved whether this large proportion of mental and physical defects which is much greater than is found in the general population, is attributable to alcohol, or to the pre-existing mental defect.

In the second paper, the theory of the first—that there is no close relation between mental defect in the children and alcoholism in the parents—has been abandoned, and a close relationship is admitted, while segregation is called for on the grounds of hereditary character. Nothing is specific, it will be observed, is said with reference to the undoubted physical stigmata of such degenerates.

Professor Pearson contends that mental defect is antecedent to alcoholism. But what, it may be asked, antecedes the mental defect? Unless this can be answered satisfactorily, one must come full circle to the original standpoint, and be confronted by the old problem. The Pearsonites have abandoned the position that 'the balance turns as often in favour of the alcoholic as of the non-alcoholic parentage,' and practically admit that alcoholism and mental defect are associated; but whether the one precedes the other, and which precedes the other, they do not know. As far as the controversy has gone, there can be no doubt that the authorities who believe that alcoholism, not gross alcoholism—about that there do not exist—but that fairly general kind of free indulgence which takes place daily, with frequent 'week-end' bouts, does lead to the physical and mental impairment of the offspring, are in the right, and can produce unquestioned evidence in support of their view. Than this no controversy of greater moment in regard to alcoholism has been started. To make the impression more hurriedly, irrefutably, and value, a statistical and clinical research into the comparative physique and capacity of the descendants of alcoholic and non-alcoholic parents respectively in several carefully chosen districts would be required, and it is not too much to anticipate what the conclusion would be. It would finally determine whether there is any marked correlation between parental alcoholism and inferiority of offspring manifesting itself not only in childhood but in adolescence; and it would dissipate views calculated to do infinite harm to the race and to the commonwealth.

The degeneracy of alcoholic offspring is attested by such authorities as Magnan, Morel, Lancereaux, Crichton-Browne, Logrand du Saulle, John Macpherson, etc., and it comes about in many ways. The male parent who is a 'soaker'—we need not consider the physical state of the progenitor suffering from the effects of an occasional bout at the time of conception—undoubtedly begets a weak offspring, made sure if his habits worry and impair his physical constitution. The female offspring is more likely to be the subject of hereditary alcoholism, and when the mother is the offender the males perpetuate the parental failing (herédité croisée). It is thought, and there are strong grounds for the presumption, that the female progenitor is the surer and more general transmitter of the hereditary alcoholism of the offspring, and that only occasionally beget defective males. The alcoholic defect either vanishes in insanity, imbecility, and nervous diseases. The proportion of the alcoholic mother, in handing on to her offspring a constitution not only physically, at least, but intellectually not to be gainsaid. This view accords with common sense, even if exact statistical records are wanting, for not only is her condition at conception of moment, but so also is the fact that during utero-gestation and lactation the blood is charged with the toxic agent, specially so during pregnancy. The heredity may be 'immediate' from one or both parents, or 'mediate' from grandparents, the 'immediates' having been free from the taint. And the heredity may be homogeneous or heterogeneous— in one group inebriety begets neurotic children; in the other the inebriety of members of a family springs from neurotic parentage, which may not, and in some cases, even does not, owe its existence to alcoholic excess.

Four of the foremost advocates of the non-transmission of personally acquired characters are Galton, Weikert, Pearson, and Dr. A. Reid—recognized authorities on the principles and laws of heredity. In their view environmental influences play a secondary part; heredity is everything. One may ask the question in this connexion, Are the bad mental effects of vicious habits and alcoholic excess passed on to descendants, thus setting up racial degeneration? Dr. Ford Robertson, following Darwin, Maunsley, and Hartwig, traverses Dr. A. Reid's proposition that 'inborn characters are known to be transmissible from parent to offspring,' and postulates for himself the remarkable doctrine and dogma that 'offspring, as far as can at present be determined, inherit no character whatever from their parents. . . . The distinction between inborn and acquired characters has really no justification in modern scientific fact... . Although there is no inheritance of parental characters, there is of environmental influences, to which all that is of any importance in human ontogenetic evolution (i.e. the development of the individual) is directly due. There is here evidence of acute dialectic diversity: both. . . .

3. Statistics.—The following statistics, which have a profound significance, are submitted in order to give some idea of (1) the annual mortality, sickness, and unemployment consequent upon excessive indulgence; and (2) the prevalence and cost of pauperism, panem lunacy, criminality, and delinquency due to the same cause.

(a) Mortality.—It was calculated twenty years ago (Dr. Norman Kerr) that 40,000 persons die annually in the United Kingdom from drunkenness and habitual drunkenness; and Dr. Wakley, Editor of the Lancet and Coroner for Middlesex, not only confirmed this estimate, but put it higher. Of 1,500 inquests he attributed 900 at least to hard drinking, and he believed that from 10,000 to 15,000 persons died annually in the Metropolis from drink, upon whom no inquest was held. For the United Kingdom, from this calculated the total to be 50,000. Deaths from suicide, drowning, and exposure totalled 7,372 in one year in Great Britain and Ireland, and of these one may safely reckon 1,500 as due to inebriety. The total, therefore, is 51,572, or 15 per cent. Of deaths from accidents and negligence (13,386), 15 per cent may be attributed to the same cause.

Infant mortality.—For the declining birth-rate in this and other lands, to which of late attention is constantly drawn, many causes are assigned, but
in the present connexion we are concerned only with the great wastage occurring in the deserted birth-rate arising from the excess of maternal deaths, especially mothers, parental neglect arising from over-indulgence and improper feeding, no cognizance being here taken of premature births attributable to the drinking habits. The circumstances arising from thereon. In regard to the suckling of infants, the milk of the alcoholic mother is both deficient in quantity and inferior in quality, in spite of the popular belief to the contrary in favour of stout and wines; and, further, there is defective ovulation and sterility.

Comparative mortality for various trades and occupations, including the Licensed Trade itself:—

According to Dr. Newsom, if the comparative mortality figure for all men equals 1000, an equal number of gardeners would yield only 568 deaths, teachers 571, grocers 664, doctors 937 (midway), while at the other end of the scale are brewers 1407, innkeepers and men-servants 1655, and file-makers 1862. Comparing employees in inns, etc., with all other occupied males, it is found that, out of a given number in each group, 8 times as many from suicide, 1 ½ times as many from nervous diseases, 1 ½ times as many from suicide, and 23 times as many from consumption. Regarding the liability of drunkards to public injuries, Prof. Jemmott (Evidences of the 4th Report of the Royal Commission) says:—

'Alcoholism is, in fact, the most powerful factor in the propagation of tuberculosis,' and Dr. R. W. Philip (Edinburgh) agrees:—'The most vigorous man who becomes alcoholic is without resistance before it.'

Actuarial calculations made with great care and exactitude by insurance offices are significant. The best offices insist the premium as much as 50 per cent. and a few absolutely decline proposals of persons in the drink trade. And, as regards abstainers and non-abstainers, the chances of life are no less than 2 to 1 in favour of the former. The ratio is much the same in regard to sickness, recovery being speedier among the former. The moral clearly is that he who desires to live long, wisely, and well should either be a total abstainer or exceedingly temperate. For many persons total abstinence is a necessity of their being. If they are not to make early shipwreck of their lives.

(b) Crimes and petty offences.—In the United Kingdom there were 630,340 apprehensions in the year 1881. In the total, while present to many individuals as is often concluded, the same individual figuring more than once in returns. A total of 318,000 persons who have been in the hands of the police for homicide, assaults, petty thefts, prostitution, drunkenness, disorderly conduct, etc., would be nearer the mark. The total admits of a further reduction to 273,000 as the number in which alcohol plays a chief part; but, as many persons commit petty offences without being officially listed, it would be safe to put the number requiring attention, although not receiving the attention of the police at 80,000—in all 358,000, or 1 to 128 of the population. In Scotland it is reckoned that there are 4700 recidivists, both of the criminal and of the petty offender classes, waging (especially the former) an aggressive war against society, of whom 2500 are feeble-minded, delinquent, parasitical, petty offenders, and 1200 are drunkards, the latter being perhaps somewhat similar to that estimated by Mr. C. S. Loch, C.B., for England.

The sex-ratio of these parasitic offenders is interesting. If we take the lives figured by the convictions and imprisonments, and the drink figures, we have the following ratios:—

Thus from 11 to 20 convictions, males are to females 100:70; 21 to 50 convictions, 100:90; 51 to 100 convictions, 100:180; 101 and upwards, 100:240.

In Scotland, 2500 have been convicted and sent to prison 20 times, and 1330 more than 50 times. Referring to the 1833 report of the Police Commissioner in London, it makes the following of convictions and imprisonments as to the mental irresponsibility of such cases:

'It is only the shortness of human life which limits the number of convictions. Chronic offenders arising from drunkenness are suffering from a nervous closely allied to its symptomatology and heredity which is to the other nervous and to insanity' (see Summary), and 'a defective heredity which (1) induces the subject to crave for a particular mental state—not for alcohol, but for the state which alcohol most certainly produces, who presents the subject with a constitution which is particularly susceptible to the influence of such poisons as alcohol, and (2) which in many cases causes the mental unisonness of independence, of that which tends to the vegetative deterioration of the self and of life.'

(c) Cost of prisons.—In the year 1909 the cost of prisons was:—

In England, £720,340; Scotland, £85,790; Ireland, £211,660—a total of £1,083,470; cost, £7,380,000. It is safe to assume that, but for alcohol, not one-third of the whole cost, or £210,000, would be required for this purpose. The daily prison population amounts to 26,000, of whom 17,000 are interned for crimes and offences directly connected with casual and habitual drunkenness.

(d) Pauperism.—The number of paupers in England, Scotland, and Ireland, and the cost to the country locally and imperially, may be roughly expressed as:—

paupers, 1,083,470; cost, £7,380,000. It is no exaggeration to say that 50 per cent. of pauperism (cost) may be ascribed to drunkenness and habitual drunkenness—in other words, 541,700 paupers and dependents are maintained at a cost of £3,065,000. It is well known that the cost of these paupers in England, Wales, Scotland, and Ireland, numbering 62,400 picked men (England and Wales 46,000, Scotland 5670, Ireland 10,740), falls little short of £6,000,000 per annum. Of this enormous sum, drunkenness and allied offences and crimes connected directly with drunkenness, may be credited at least with one-third, £2,000,000, most from local taxation and imperial subventions. But this is not all. From the Civil Service Estimates (Class iii., 'Law and Justice,' pp. 229-333), consideration must be given to another set of heavy imperial charges under this head, amounting in all to £1,800,000 for County Courts, Supreme Court of Judicature, Reformatory and Industrial Schools, Criminal Asylums, etc. If to this enormous imperial total under the head of 'Law and Justice' be added the burdens falling upon local authorities under the same head, the total losses due to drunkenness, which drunkenness and allied offences may be debited with 33 per cent, or £560,000,000.

(e) Police.—Maintenance of the police force in England, Wales, Scotland, and Ireland, numbering 62,400 picked men (England and Wales 46,000, Scotland 5670, Ireland 10,740), falls little short of £6,000,000 per annum. Assuming that alcohol directly and indirectly is responsible for 20 per cent. of the insane, it follows that £1,200,000 per annum from rates and Government grants are required to meet the burden of providing for a daily population of 34,000 lunatics.

(f) Excise and Customs Revenue for one year.—

On the other side of the ledger must be placed the revenue raised by the duties on spirits, beer, wines, brandy, rum, etc., which may be put down at £35,000,000. When over against this revenue is put the cost of drunkenness (see Summary) in consequence of intemperance, the benefit of the enormous revenue sinks into insignificance. £170,000,000 is spent annually on drunkenness. If these two statistics submitted it is hardly possible to contemplate a graver ethical problem than this one of drunkenness, affecting as it does so prejudicially the individual, the family, the community, and the commonwealth.
SUMMARY OF THE FOREGOING STATISTICS.

4. Responsibility in drunkenness: anomalies of the Civil and Criminal Law.—There would be no responsibility if intoxication following one bouts were recognized as temporary insanity, or, after many bouts, with resultant organ disease of the brain, nervous system, and the bodily viscera (liver, lungs, kidneys, etc.), as something more than temporary insanity. The civil law is inclined to throw its shield over the drunkard; the criminal law, while not recognizing drunkenness as an aggravation, does not consider it an excuse, in spite of the fact that the sale of drink is unfettered; it will step in to save the drunkard only when given the opportunity, in our criminal law, to save him (until quite recently) only to punish him with the view of reforming him and deterring others—the latter a vain delusion, as people do not drink to commit crimes. Crime is an accident of the intoxicated state. A crime of violence is not in the drunkard's thoughts at the start, and, after intoxication has gone, and intoxication is established, the idea of deterrence for him is as absurd as the notion that he had any notion of his conduct. In 1848 the Bench of Judges laid down the law for England in regard to all forms of insanity, to the effect that to establish a defence it must be proved that, at the time of committing the act, the accused was labouring under such a defect of reason of the mind as not to know the nature and quality of his act, or, in other words, as not to know that he was doing wrong. Accepting in relation to responsibility the test thus laid down, it must be apparent to the most ordinary observer that the intoxicated authors of crime (especially homicide, serious assaults, cruelty to children, etc.), and therefore of 80 per cent. of all serious crimes, and to a very large extent of those due to drink are excluded in this connexion: implying violence and recklessness, would not be held responsible, and would either be dealt with as persons insane at the time of committal, or in the public interest would be detained in prison for long periods because of the drunkenness which led to the injury. In either case society would be protected against such potentially dangerous elements detected in it's midst, and justice would be fully satisfied. But what of the drunkards in pose? Do they take warning from those in esse? Not at all. Later, in 1856, Justice Day said: 'Whatever the cause of the unconsciousness, a person not knowing the nature and quality of his act is irresponsible for it.' The existing law recognizes that, if the drunkenness has not been voluntarily induced, responsibility has not been incurred. But who is to decide when the unconsciousness was voluntary? A ruling which has been viewed with much satisfaction was that given by Lord Low at Glasgow in 1891. He expressed his willingness to give the advantage of the benefit of the doubt, but he was not prepared to invoke malice and deliberation, but that he committed the crime while maddened by strong drink. While that was sufficient to take the case out of the category of murder, there was no question of culpable homicide. There have been several recent rulings of quite another kind in the United Kingdom: and the 'wilful' nature of the crime, as well as the 'voluntary' induced state of mind, has been much dwelt upon. The United States legal view is well put by an eminent New York jurist, Clark Bell, when he states that 'the better rule of law undoubtedly now is that if the person at the time of the commission of the act was unconscious and incapable of reflective action, he could not be convicted. There must be motive and intention.'

Before leaving the 'wilful' nature of the crime and the 'voluntary' induced state of mind, I think it may with reason be asked, Do such cases admit of other interpretations? Might it not be argued, both on its own merits and in the light of more enlightened judicial rulings, (1) whether a man drunk can legally do a wilful act; (2) whether at any stage of a habitual or periodic drunkard's bout the drinking was 'voluntary,' for that would imply the certainty of the absence of latent or patent physical and mental degeneration; and (3) whether, admitting, as in the case of the occasional drunkard, that the imbibing of a moderate quantity was 'voluntary,' the moment inhibition is sufficiently impaired—sooner or later in others, but by reason of the exhaustion of the drunkenness and a period of paralytic intoxication of the higher nerve centres by the toxic agents—further drinking, leading up to the paroxysmal and frenzied states revealed ad nauseam in the criminal law of the United States states, that the 'wilful' crime would have been committed. But, in these cases seem where a plea of 'insane at the time' would be a good and valid one, or the resultant crime would be reduced from murder of the first degree.

The anomalies which emerge when the civil and criminal laws are examined in regard to drunkenness are remarkable. As the capacity to perform intelligently an important act is liable to be seriously impaired, the imbibing of a sufficient quantity of alcohol is liable to vitiate civil acts. Witnesses in civil as well as in criminal trials, when visibly under the influence of drink, have been asked by judges to stand down; or, if they are permitted to give evidence, it is properly discounted. In Scotland an intoxicated prisoner's declaration is considered invalid. In England, the Lord Chancellor acting in Lunacy may, if an inquiry in lunacy has established that any one has been unable to manage his affairs through confirmed intoxication, take the person and property into his custody. Wills are voidable if made when the testator is drunk, whether the testator was or was not, with the property of the intestate, and by reason thereof, intoxicated. Property sold or disposed of under such conditions may be followed by restitution when sobriety is attained. Contracts are now also voidable when the law discovers that the drunkenness was contrived at by the other party for purposes of fraud. They become valid if ratified when sober. Intoxication implies incapacity to consent, and a contract involves the mutual agreement of two minds, so that, if one party has no mind to agree, he cannot make a valid contract. It is not a question of two sober persons differing in bargaining astuteness. This will always be; but it is different when one of the two is drunk. In the United States it is held that, if the bargaining is fair and free from fraud and not over-reaching, it will stand, even although one of the parties was intoxicated. The Judicial Committee of the Privy Council, in a Canadian case, held that the present law of drunkenness rendered habitual drunkenness a sufficient ground for setting aside paternal rights. In British law it has been ruled that, if either party to a marriage contract is under the influence of drink, the marriage is voidable. Intoxication is held to vitiate the use of drink as not to understand the nature and consequences of the act, proof of which would render the act invalid. It is presumed in such a case that there was no intent to marry. To note, all intent and purposes, the civil law shields the drunkard from the consequences of civil acts, testamentary
dispositions, and contracts made in a state of intoxication—thus practically admitting the condition as one of non compos mentis for the time being.

§ 5. Legislation affecting drunkenness.—(1) Great Britain.—In Great Britain, the Legislature, stimulated by Reports of Royal and Departmental Commissions on Licensing, Poor Law, the Feeble-minded, and Habitual Offenders and Inebriates, has in recent years done a good deal with the object of removing temptation in congested slum areas. For the casual drunkard, the laws provide slight penal treatment involving a few days in prison or a small fine, for the payment of which time may be allowed by the Stipendiary, Justice, or Magistrate before imprisonment takes effect; or the offender may be liberated after imprisonment by part payment of the fine equivalent to the time still to be served in prison, the partial fine being provided by friends or by his own labour. For the reformation and protection of habitual drunkards, many of whom are feeble-minded, mentally unstable, and degenerate, the published many such in ten thousands is, in the vast majority of cases, applied to them, and only in a very few cases after conviction are the habituals sent to Certified or State Reformatories. The latter, maintained solely by the State, receive the worst offenders and those not amenable for refractory or intractable, cases; the former, with its semi-penal atmosphere, the quieter and more hopeful cases, who for misconduct and insubordination may be transferred to the latter. The inmates, on cause shown, may be transferred from one to the other by order of the Secretary of State. The State Reformatories are supported by Government grants, the certified by local rates and Treasury subventions; besides the income from the management of the institution, neither has been the success anticipated, or anything like it, owing to the working of the Acts. Stipendiaries and Magistrates have taken little advantage of the Act of 1898 as to Certified Reformatories, and, when they have taken advantage of it, they have hitherto selected wholly unpromising material in many cases. As regards cases suitable for the State Reformatories, Sheriffs and County Court Judges have not availed themselves of the power conferred upon them. There is also a reluctance, on rating grounds, on the part of local authorities, singly or in combination, to provide Reformatories to meet the increasing requirements of the State, which is the principal institution receiving pauper inebriates. Although there is, on the whole, fairly good legislation in the States in the interests of inebriates who are either well or comfortably off in the matter of resources, there is, as in Great Britain, practically no provision made for the impecunious, except for those falling into the hands of the police, and for them the provision is miserably inadequate. (2) British Colonies.—(a) Canada.—Nearly all the Provincial Legislatures have enacted effective measures for habitual inebriety. Ontario in 1873 passed an Act to set up a Home for voluntary and involuntary inmates—the term of stay not to exceed 12 months. A petition is presented to the Judge of the District Court by friends or relatives, or the patient himself; the Judge may grant the petition or send the patient to the Home for trial. Canada can pronounce interdict, and can appoint a Retreat either voluntarily or by order of the Committee of the Habitual Drunkard. In 1867, King's County, N. Y., established a Home. Entrance was voluntary or by order of the Trustees of the Home, who were about to send the criminal to the County jail and select fit subjects. Further, on the report of a Commission of Inquiry to the effect that any person was a habitual drunkard, and incapable of managing his or her affairs, a Petition was then to send the person to the Home. The Home received 12 per cent of licence monies. In 1892 a Home for alcoholics and drug females was set up in Manhattan Island. The inmates of either half were admitted voluntarily or under compulsion. When compulsion was resorted to, two medical certificates were necessary and the order of a Judge, who could call for affidavits or take proof. In 1897, the Washington Home, Chicago, was erected. This Home received, till expiry of original sentence, any person convicted of drunkenness or any misdemeanour occasioned thereby. In the same year the Pennsylvania Sanatorium was opened. In 1898, the Select Committee of the Habitual Drunkard, the institution could receive him on presentation, by his guardian or friend, of the certificates of two doctors attested by a judicial officer. In Connecticut, the Committee of Probation and Reform in 1874, on a majority of the Select men of the town, could order an inquiry as to the allegation of habitual drunkenness arising from drink or drugs. This is the first reference to the need for investigating judicially the pernicious drug habit—unfortunately a growing one in every civilized country. If habitual drunkenness was proved, the patient was conveyed to an inebriate asylum for a period of ten years. The dionysomania was thus viewed in a worse light than the other. Superior courts had the right to interfere and discharge at any time. In New Jersey the application of a 'voluntary' requires to be attested by one Justice, or the applicant may present himself at the Home, and fill up a form, which is as binding as when attested by a Justice. A person drunk when received may, on becoming sober, sign a valid and binding application. The Massachusetts Home has accommodation for 200 patients. If one is unable to pay for maintenance, the Municipality may be called upon for the costs. The New York Home is the principal institution receiving pauper inebriates. Although there is, on the whole, fairly good legislation in the United States in the interests of inebriates who are either well or comfortably off in the matter of resources, there is, as in Great Britain, practically no provision made for the impecunious, except for those falling into the hands of the police, and for them the provision is miserably inadequate. (3) America.—The United States passed the first Inebriate Act in 1854, under which patients could enter a Retreat either voluntarily or by order of the Committee of the Habitual Drunkard. In 1867, King's County, N. Y., established a Home. Entrance was voluntary or by order of the Trustees of the Home, who were about to send the criminal to the County jail and select fit subjects. Further, on the report of a Commission of Inquiry to the effect that any person was a habitual drunkard, and incapable of managing his or her affairs, a Petition was then to send the person to the Home. The Home received 12 per cent of licence monies. In 1892 a Home for alcoholics and drug females was set up in Manhattan Island. The inmates of either half were admitted voluntarily or under compulsion. When compulsion was resorted to, two medical certificates were necessary and the order of a Judge, who could call for affidavits or take proof. In 1897, the Washington Home, Chicago, was erected. This Home received, till expiry of original sentence, any person convicted of drunkenness or any misdemeanour occasioned thereby. In the same year the Pennsylvania Sanatorium was opened. In 1898, the Select Committee of the Habitual Drunkard, the institution could receive him on presentation, by his guardian or friend, of the certificates of two doctors attested by a judicial officer. In Connecticut, the Committee of Probation and Reform in 1874, on a majority of the Select men of the town, could order an inquiry as to the allegation of habitual drunkenness arising from drink or drugs. This is the first reference to the need for investigating judicially the pernicious drug habit—unfortunately a growing one in every civilized country. If habitual drunkenness was proved, the patient was conveyed to an inebriate asylum for a period of ten years. The dionysomania was thus viewed in a worse light than the other. Superior courts had the right to interfere and discharge at any time. In New Jersey the application of a 'voluntary' requires to be attested by one Justice, or the applicant may present himself at the Home, and fill up a form, which is as binding as when attested by a Justice. A person drunk when received may, on becoming sober, sign a valid and binding application. The Massachusetts Home has accommodation for 200 patients. If one is unable to pay for maintenance, the Municipality may be called upon for the costs. The New York Home is the principal institution receiving pauper inebriates. Although there is, on the whole, fairly good legislation in the United States in the interests of inebriates who are either well or comfortably off in the matter of resources, there is, as in Great Britain, practically no provision made for the impecunious, except for those falling into the hands of the police, and for them the provision is miserably inadequate.
a curator to manage the drunkard's affairs, and control his person as in interdiction for insanity. A family council is called by the Judge to investigate the truth of allegations, and a petition is served on the alleged 'habitual,' who may be required to enter on a system of abstinence and regain civil rights. Willful and knowing sale of drink to the interdicted is finable and punishable. The curator, sometimes termed the guardian, may place his charge out of the house, and may remove him at any time. The Quebec Province law of interdiction closely resembles what obtained in Scotland 100 years ago, but fell into desuetude, although there are competent authorities who say it could, without statutory enactment, be revived again. In Manitoba the petition is presented by a public officer. There is much to be said for the creation of such an official, as relatives are often placed in an inviolable position, and will not move. Relatives and neighbours are summoned and put on oath. The interdicted may be confined in any place where the Judge may think proper, and be visited or examined by the County Sheriff. While interdiction lasts, baggage, sales, and contracts made are null and void. The interdicted may be discharged and re-vested after proof of 12 months' abstinence.

(c) New Zealand.—Admission is either voluntary or involuntary. Residence is in a ward or division of a house, or on the farm, quite apart from the insane. Great difficulties, as might be looked for, have been experienced in complying with this part of statutory requirement, and special accommodation has long been considered urgent.

6. Prophylaxis and therapeutics.—One of the few hopeful features of the drink problem is the gradual diminution in the use of alcohol in society and in the treatment of disease in hospitals and in private practice, until now it is at the vanishing point as a drug, stimulant, or tissue-builder. In 1892 the principal London Hospitals from 1872 to 1902, although the daily resident population has varied immensely, the overall consumption of alcohol has fallen 32 per cent. No less striking and satisfactory are the figures for the Wandsworth Union, in which the number of inmates, inclusive of the sick, has increased 283 per cent, while the spirit bill has fallen from £571 to £2, 7s. Equally interesting are the figures for the Hospitals of the Metropolitan Asylum Board for 1894 to 1905. The total under treatment for 'fevers' rose from 19,900 to 27,807, while the consumption of alcohol, including stimulants, fell 53 per cent, from £1388 to £515. The same tale could be told of every hospital in the land; and it is especially significant, since the full is the only recorded instance in the medical literature of a prophy-
atic research. In surgical wards of hospitals and in maternity wards, patients operated upon rarely get alcohol, except for 'shock' and severe hemorrhage, especially post-partum (Dr. W. L. Reid, Glasgow), and in these directions alcohol is being superseded by other and better substitutes.

During a drinking bout numerous untoward or fatal accidents often occur. Sensibility and co-ordination of stomach, which is perhaps the least to be feared, as the poison may be rejected, retention of urine, suffocation resulting from the position of the body (head rests on the clinched hands, the child, if convulsed, may suffocate). Shearing death takes place from deep toxic narcosis, exposure, drowning, or bodily injuries. Apoplexy is frequently mistaken for drunken comas, the person with the apoplectic seizure, it may be, smelling of alcohol.

In regard to treatment, something requires to be said of what one might term orthodox medical treatment, and of the many puffed 'secret cures,' freely advertised, regardless of expense, of which only the rich can avail themselves. Before admittance into any of the Homes in which the 'secret' cure is practised, a bargain is struck, and a big sum of money is paid down. Benevolence or philanthropy does not enter into the nature of the remedy, so far as the vendor is concerned, is kept 'secret.' But there is no secret about it, as nearly all such remedies have been analyzed by competent chemists, and their contents are known. As a rule, the composition of the best of them in no way differs from the composition of these prescribed by physicians who act for the good of their patients, and charge the interest on the profits from the sale of the remedies.

LITERATURE.
DUALISM

DUALISM (Introductory)

J. F. SUTHERLAND.

DRUSES.—See Sects. (Christian).

DRYADS.—See Hamadryads.

DUALISM.—The term 'dualism' appears for the first time in Thomas Hyde's Hist. religionis veterum Persorurn (e.g. cap. 9, p. 164), published in 1700, and is there applied to a system of thought novel phileo in which the Evil Being is co-ordinate and co-eternal with the primal Good. The word was employed in the same sense by Bayle (cf. art., Zoroastre, in his Dict., ed. Paris, 1820) and Leibniz (in his Thetis; cf. Erdmann's ed., Berlin, 1874, p. 5475). It was then transferred from the sphere of ethics and religion to that of metaphysics by Christian Wolff (1679-1754). Wolff applies the term 'dualists' to those who regard body and soul as mutually independent substances, and contrasts such thinkers with the monists, who would derive the totality of the real either from matter alone or from spirit alone. The Wolffian usage of the term is now by far the most generally received, although it is sometimes found the word applied to certain theories in ethics, epistemology, and the philosophy of religion.

In its application to the relation between soul and body, spirit and nature, the term 'dualism' recalls a problem which goes back to a very early period, and which has received various solutions in the evolution of human thought. Among the ancient Greeks the tendency was to bring the physical and the psychical into very close relations with each other. Thus their philosophy begins with a naive monism—hylozoism; and, in particular, their artistic achievement reveals a marvelous harmony of the spiritual and the sensuous. But dualistic tendencies likewise began to manifest themselves at an early stage, as, e.g., in the teaching of the Orpicles and Pythagoreans regarding the constitution of soul and body, a doctrine which implies that the soul is independent of the body. In philosophy, however, it was Anaxagoras (q.v.) who first explicitly disengaged spirit or mind (νοῦς) from matter, setting the former, as the simple, the pure, the unmixed, in opposition to the latter; and we may, therefore, speak of Anaxagoras as the first philosophical dualist. But the dualistic mode of thought finds its most magnificent expression in the development of scholastic philosophy of the world of ideas from the manifold of sense. Aristotle, on the other hand, inclines rather towards monism, as appears from his definition of the soul as the entelechy of the body. But his conception of the spirit (νοῡς) as something added to the process of Nature from without, and separable from the body, bears an unmistakably dualistic character.¹ It is certainly true that in the later period of the ancient world the Stoics advocated a monistic hypothesis, by regarding body (νηστοικος και δαικος) into close connexion with each other, and affirming the material nature of all reality; but when, in the further evolution of ancient social life, the old ideals began to lose their fervour, and the dark age returned and more engaged the minds of men, and when, above all, dire moral perplexities began to be felt, matter gradually came to be regarded as something obstructive and evil—something from which the individual must try his best to deliver himself. Thus arose the ascetic ideal of life, and, in hand with it, a rigid dualism. Accordingly we find that the last great system of ancient thought, that of Plotinus, was also a paragone of sensual matter, while the intel- ligible world and the world of sense are set in rigorous opposition to each other. See, further, the 'Greek' section of this article.

Christianity, in its essential principles, has no affinity with a dualism of this kind. Looking upon all that exists as the handiwork of God, it cannot regard matter as something unworthy. Its firm contention is that the source of evil lies, not in matter, but in voluntary action, in the apostasy of spiritual beings from God. Another element which militates against the dualistic tendency is the fact that in Christianity the body ranks as an essential constituent of human nature, as is shown, in particular, by the doctrine of a bodily resurrection. Notwithstanding these facts, however, Greek and Oriental dualists forced their way into the early Church on a wide scale, as appears from the prevalence of asceticism (see ASCETICISM [Christian]), gained a vast influence over the Christain mind. As we might expect, its grasp was still further strengthened by the Platonicism which prevailed in the first half of the medieval period. On the other hand, the ascendency of the Aristotelian philosophy in the culminating stages of medieval thought as the highest expression of a rigid use of science, rather favourable to monism, since it did not permit of any hard and fast antagonism between body and soul. But the Aristotelian view at length underwent a certain modification, in so far as the champions of medieval Aristotelianism, Albertus Magnus and Thomas Aquinas, held that the vegetative and animal faculties of the soul, which Aristotle himself assigned wholly to the body, are conditioned by the body only in their temporal functions, and therefore also share in the immortality of the spirit. This view was officially recognized as the doctrine of the

¹ Psychologia Rationalis, Frankfurt, 1722, § 39: 'Dualistae sunt, qui et substantiarum materialium et immaterialium existentiam admissi.'

² Cf. e.g. Aristotle, Metaph. i. 6 (Bekker, p. 998, 14): φύσις τε και ψυχή ου προέρχεται από του ἄλλου κοινως και καθορισμως; τυχεριτας, vi. 8 (505, 24): δε αριθμοι συνεπηρεται από του καθορισμος σωματος και ψυχης (που εστι εν των ψυχων και ουκ εστι εν τω σωματω); τον ημων ανθρωπον αριθμον παντοτε μεταξυ τον ψυχης και ως δυο ειδη του ου και σωματος ειδην ειδην, και ουκ ειδην ειδην; de Anima, 1. 2 (400a, 13): 'Αναγεννηθαις τουτοι μοιχος λογος φησι τε και ψυχης, χρηματος δε και μιας φυσεως; τον ανθρωπον αριθμον μεταξυ των ειδων και ειδην ειδην, και ουκ ειδην ειδην.'

³ De Anima, 1. 6 (415b, 4): και τον ανθρωπον την ψυχην εις ου και σωματος ουκ εις ου και ως δυο ειδην, και των εναν των ειδων ειδην, και των ειδων ειδην.'

⁴ De Anima, 1. 6 (415b, 5): 'Εν τω γαρ ανθρωπω δια των ειδων ειδην ειδην ειδην και ουκ ειδην σωματικον και ψυχην δια των ειδων ειδην περιποιημαι.
Catholic Church by the Council of Vienne (A.D. 1311).

Modern philosophy, as inaugurated by Descartes (q.v.), opened with an unqualified dualism. The conceptions of matter and mind were now for the first time distinctly and clearly distinguishable from each other. Descartes' definition of body and soul respectively as *substantia extensa* and *substantia cogitans* obviously made it impossible to bring the two under a single concept, since the latter substance was held to be absolutely indivisible, while the spatially extended substance is capable of infinite division. Body and soul have thus no internal principle of unity, but are simply joined together by the will of God. A distinction so absolute could not, of course, remain permanently unchanged, but it sufficed at least to put an end to the hitherto prevailing confusion between the physical and the psychological interpretation of phenomena, and made it henceforth necessary to explain Nature by Nature, and the psychical by the psychical. The natural sciences, in particular, had suffered serious detriment from the theory of a sustained physical principle of all natural processes—more especially the formation, growth, and nutriment of organic bodies—as immediately due to the workings of the soul; for, of course, the practice of tracing natural phenomena to psychical causes stood in the way of all advance in exact science, and it was the dualism of Descartes, with its precise delineation of concepts, that first brought such advance within the range of possibility.

This dualism maintained its ground as the dominant hypothesis of the period of Illumination, and Wolff himself claimed unequivocally to be a dualist. But his notion of the antithesis between mind and matter abandoned an endeavour to bridge the gulf in some way, and to find some explanation of the connexion that actually obtains. Descartes himself manifests this striving in his doctrine that the physical and the psychical have their point of contact in the pineal gland; and further instances are found in occasionalism, with its belief that material and spiritual processes are maintained in mutual harmony by Divine agency, in the system of Spinoza, who regarded the two great divisions of phenomena as the attributes of a single substance; and in Leibnitz's doctrine of monads, which derives all reality from spirit, and explains the forms of the universe in the names of souls.

A defection from the prevailing belief in dualism, however, ensued only with the break-up of the Illumination and the emergence of new currents of thought. Various factors combined to make a stand against it. First of all, the movement towards an artistic interpretation of life and a more natural conception of reality—so found alike in the Neurorimatism represented by Goethe and in romanticism—intensified the need of an inherent connexion between Nature and spirit, the sensuous and the non-sensuous. Then came the speculative philosophy of Germany, with its interpretation of all reality and all spiritual life. But the most potent factor of all was modern science, which demonstrated in countless ways the dependence of psychical life upon the body and bodily conditions, alike in the experience of the individual and throughout the entire range of organic being. This forms the starting-point of the theory which with special emphasis now claims the name of monism, and rejects everything in the nature of a self-sustained psychical life. Nevertheless, as has been well said by so eminent a contemporary thinker as Wundt, this monism is in essence simply a return to the hylozoism of the Ionian philosophers; and it is certainly open to doubt whether the question is quite as simple as monists make out, and whether the entire intellectual movement of the eighteenth century was simply a problem, been barren of all result, as monists must perfide maintain. This point will be further dealt with, however, in the article MONISM; and it need only be said meanwhile that it is one thing to think of the world as consisting of absolutely diverse provinces, and quite another to regard human experience as embracing different starting-points and different movements, which can be brought into closer relations only by degrees and in virtue of progressive intellectual effort. It is impossible that dualism should constitute the final phase of human thought; but, in view of such consummation, it has an important function to perform, viz. to put obstacles in the way of a premature synthesis, and to insist upon a full recognition of the antitheses actually present in human experience. Dualism, in virtue of its precise definition of concepts, is least liable to that confusion into which monism so easily lapses; and, to realize the value of such a rôle, we need but recall the aphorism of Bacon: 'veritas potius emergit ex orroribus quam ex confusionibus.'

R. Eucken.

**DUALISM (American).—**The view which has obtained in several quarters, that an ethical dualism exists in the teaching of the early missionaries to the Indian tribes, is a wholly mistaken one. No ethical contrast existed in the native mind between those deities who assisted man and those who were actively hostile to him; and it has been made abundantly clear that such dualistic ideas as have been found connected with other religious conceptions of American Indian peoples owe their origin to contact with the whites. The view that dualism did exist arose from the misconceptions of early missionaries, assisted in many instances by the mistranslation of native words.

'The idea that the Creeks know anything of a devil is an invention of the missionaries' (Gatschet, op. cit., 1890, p. 215). "The Indians believe neither in a hell nor a devil" (Matthews, op. cit., 1890, p. 199).

In some cases the same word which the missionaries have employed to translate 'devil' they have been compelled to use to render 'spirit.' The early missionaries regarded the gods of the Indians as devils, and taught their converts to look upon them as such, but in some cases the natives disagreed with their teachers, attempting to explain to them that their deities were the bringers of all good things, and by no means evil. This, of course, implied not that their gods were 'good' in the ethical sense, that they loved righteousness and hated iniquity, but that they conferred on man the merely natural blessings necessary for a savage existence. Winslow, in his *Good News from New England* (1622), says that the Indians worship a good power called Kiehtan, and another 'who, as faileth as wee can conceive, is the Devil,' named Holhamoek, or in Hohlamoqui. The force of those names is merely the word 'great' in the Algonquin language, and is probably an abbreviation of *Kultanontew*, the 'Great Milton'—a vague term mentioned by Williams and other early writers, and in all probability manufactured by them (see Duponceau, *Languages de l'Amérique du Nord*). On the other hand, the god whom Winslow likens to the power of evil was, in fact, a deity whose special function was the cure of diseases;
he was also a protector in dreams, and is explained by Jarvis as "the Oke, or tutelary deity, which each Indian worshipped."

In the religious conceptions of some tribes the same god is both 'good' and 'evil,' in the sense that the moral judgments of ordinary mankind would have it. Thus Ak-Kanet, worshipped by the Uspe of Brazil, is the name for the supernatural in general, from which all things come, good and evil. In the unison of conceptions, 'good' and 'evil' are supreme deities, the father of all things. The Jesuit missionaries rarely distinguish between good and evil deities, when speaking of the religions of the northern tribes; and the Moravian Brethren, writing of the Algonquins and Iroquois, state that 'the idea of a devil, a prince of darkness, they first received in later times through the Europeans.'

...In the way the Uspey of the Peruvians and the Mictla of the Nahua were not embodied in the evil principle, but simply gods of the dead, corresponding to the classical Pluto. The Jesuit missionaries rarely distinguish between good and evil deities, when speaking of the religions of the northern tribes; and the Moravian Brethren, writing of the Algonquins and Iroquois, state that 'the idea of a devil, a prince of darkness, they first received in later times through the Europeans.'

'...have never been able to discover from the Dakota themselves, says G. H. Pond, a missionary to them for eighteen years, 'the least degree of evidence that they divide the good and evil in such a manner as to persuade themselves as well as others that they are to be visited with punishment or the dire effects of natural calamities by those persons who represent them as doing so as to incommodiously, and because it is so natural to subscribe to a long-established popular opinion' (Ep. Schoolcraft, Indian Tribes, p. 643).

Myths have arisen in several Indian mythologies since the tribes in whose religions they occur have come into contact with Europeans. In these myths the concepts of good and evil, as known to civilized nations, are introduced; and several myths that have been altered to bring the older conceptions into line with the newly-introduced ideas of dualism. The comparatively late introduction of such views finds remarkable confirmation in the myths of the Kiche (Quiche) of Guatemala, which are recorded in the Popol Vuh, a compilation of native myths made by a Christianized Kiche scribe of the 17th century. Dimly conscious, perhaps, that his version of these myths was coloured by the opinions of a lately-adopted concept of Christianity, he says of the Lords of Xibalba, the rulers of the Kiche Hades: 'In the old times they did not have much power. They were but annoyance and opposers of men, and, in truth, they were not called gods. Speakings of the Mayas, Cogolludo says: 'The devil is called by them Xibalba, the derivation of which name is from a root meaning 'to fear'; it relates to the fear inseparable from the idea of death, and has no connexion in any way with the idea of evil in abstract. The gods of the American Indians, like those of other savages, are too anthropomorphic in their nature, too entirely savage themselves, to partake of higher ethical qualities. Personal spite or tribal feuds may render some more imitable than others, but always purely from self-interest, and not through a love of evil for evil's sake. Some, again, fail to pass from similar motives, and not from any purely ethical sense of virtue.

...In the case of the Irish Celts is characterized by the love of the Kish or, in the sense of the old Irish law, the love of the kin or clan, and not by the love of a goddess of a popular sense. The gods of the Kish were largely from similar motives, and not from any purely ethical sense of virtue.'

LEWIS SPRINGER.

DUALISM (Celtic).—Little or nothing is known to us of the religion of the ancient Celts as an ethical religion. The reference to it in classical writers, the evidence of inscriptions, the Welsh and Irish texts, and the witness of folk-survivals reveal it almost wholly as a Nature-religion. To some extent the dualism which is more or less present in all Nature-religions characterized Celtic mythology, but how far it was also an ethical dualism is a matter of controversy. The myth of the Greek gods, who were largely engaged in agriculture, there was a cult of divinities and spirits of growth and fertility whose power and influence might be aided by magic or prayer. Opposed to growth and fertility were alike disease, and death, the evidence of which was seen in pestilence, in bad seasons, and in the desolation of winter. As growth and fertility were the work of beneficent deities, so these evils were probably regarded as brought about by personal agencies of a supernatural and evil character. The drama of Nature showed that the sun was sometimes vanquished by cloud and storm, though it soon renewed its vigour; that summer with all its exuberant life died at the coming of winter, but that it returned again full of vitality; that vegetation perished, but that it received annually the ample plenteude. But what was true of Nature was true also, in mythology, of the personal and supernatural forces behind it. Beneficent and evil powers were in conflict. Year by year the struggle went on, year by year the gods of growth and fertility renewed their assaults, while the gods of evil and immortality. But the struggle, nevertheless, went on year by year. The gods might perish, but only for a time. They were immortal; they only seemed to be wounded and to die.

Such a dualistic mythology seems to be represented by the euhemerized account of the battles between the Boronians and the Thutha Dé Danann in the Irish texts. Whatever the Boronians were in origin, whether the gods of aboriginal tribes in Ireland, or of a group of Celtic tribes at war with another group, it is evident that they had come to be regarded as evil and malicious, and could thus be equated with the baneful personages already known to Celtic mythology as hostile to the gods of growth and fertility. It is evident that the Irish Celts possessed a somewhat elaborate mythological rendering of the dualism of Nature, and this seems to survive in the account of the battle or battles of the Magtured. But, after the Christianizing of Ireland, the old gods had gradually come to be regarded as kings and warriors, and this euhemerizing process was completed by the annalists. Hence in the account of the battles, while it is evident that in some aspects the hostile forces are more than human, the gods are described as kings and great warriors or as craftmen. The Boronians appear as the baneful race, more or less demons, inhabiting Ireland before the arrival of the Thutha Dé Danann. But we also hear of the Firbolgs and other peoples, who are clearly the aboriginal races of Ireland, and whose gods the Boronians are sometimes said to be. The Boronians are certainly the gods of the Irish Celts or of some large group of them.

...Early Irish literature knew only one battle of Magtured, in which the Firbolgs and other peoples, who are clearly the aboriginal races of Ireland, and whose gods the Boronians are sometimes said to be. The Boronians are certainly the gods of the Irish Celts or of some large group of them...

...In the later accounts the battle is dupliicated, and the first sight takes place at Magtured in Mayo, and the second at Magtured in Sligo, two hundred years after the first. In the latter the leader of the Thutha Dé Danann, Nuada, loses his hand, and this remains a point on the grandew of the character of the god. Nuada, and given to Bro, the son of a Boronian by a woman of the Thutha Dé Danann. There is the usual inconsistency of myth here and elsewhere in these notices. The Thutha Dé Danann have just landed in Ireland, but already some of them have united with the Boronians in marriage. This is not the euhemerizing chronicle, but it clearly points to the fact that the Boronians and Thutha Dé Danann were super-
Ireland, and, though in conflict, yet, like conflicting barbarous tribes, occasionally uniting in marriage. The second battle took place on May Eve, which is the beginning of the Celtic summer (see Festivals [Celtic]). Meanwhile the Tuatha Dé Danann had been forced to pay tribute to the Fomorians and to yield up the corn harvest, to avoid their having being conquered. This shows that the ceremonials probably mis- take the end of winter for the beginning of summer, the only a gambarled form. Myths must have told of the temporary defeat and subjection of the benevolent Nature-gods, followed by their liberation after a victory. Following the annalistic account, we find that the exorcising dumbness was in the hour at which the灵感 was satirized by a poet, and 'ought but decay was on him from that moment.' Meanwhile Nuadu had recovered his hand, and Bres, the king of the Fomorians, went to collect an army from his father, who sent him to Balor and to Ineduc. These assembled their forces and pre- pared to attack the Tuatha Dé Danann. In the course of the battle which followed, Indec wounded Ogma (probably a culture-god) and Balor (a personification of the evil eye) slew Nuadu, but himself received a mortal wound from Lug (perhaps a sun-god). This put an end to the band; the Fomorians were routed, and fled to their own part of the country.

Another inconsistency in the annalistic account is that, while the summer is fought on Sambain, one would naturally expect, as powers of light would be represented the vanquished not on a winter but on a summer festival. Perhaps the old myths told of the defeat and subjection of the gods on Sambain, and the victory over the viziers of light on Beltane.

It is clear that the Fomorians, in their opposition to the Tuatha Dé Danann, and from the sinister character assigned to them in folk-tradition, had come to be regarded in mythology as identical with those beings who, to the Celts of Ireland, represented the powers which were unknown to man and foreign to his gods. Blight, disease, fog, winter, the raging sea, and all influences of evil are personified in the Fomorians. Before them men trembled, yet they were not wholly cast down, for they knew that the bright and terrestrial gods, who give light and cause growth, were on their side and fought against their enemies.

A similar enunciated version of old dualistic myths, though presented in a more romantic form, is perhaps to be found in the Welsh story of Lludd and Llewydd.

Lludd is an old divinity (perhaps the equivalent of the Irish Nuadu) who, in this story, figures as a king of Britain. His country is subjected to three plagues: that of the race of the Corannians, who bear every weapon wherever they are spoken, that of a shriek heard all over the island on May Eve, which sears every one, and leaves animals, trees, earth, and water barren; and that of the mysterious disappearance of a year's supply of food. From these three plagues Llewydd by his advice relieves Lludd of them, which he did by causing them to come into the night of things, in which he must bruise in water. Then, having called together his people and the Corannians, he is to throw the water over them. It will poison them; the Corannians are to no have the night of his own race in the country. The second plague is caused by the attack made on the dragon of Llewydd by a dragon with a dragon's head and a dragon's tail, who instructed Lludd how to capture both. This is done, and Lludd burns them in a kiln at Dinas Emrys in Snowdon. The third plague is caused by a mighty magician who, while every one is lulled to sleep by his magic, carries off the store of provisions. Lludd must, therefore, watch, and, whenever he feels a desire to sleep, must plunge into a cistern of cold water. Following this advice, he captures and overpowers the magician, who becomes his vaesar (Loth, Middle Ages, Paris, 1889, L. 773). The Corannians are described as the Priads as a hostile race of invaders, and, contrary to this story, they are said not to have left the island (Lott, II, 256, 274). But the method of getting rid of them is not always the same, for it is possible to the incident of the dragons and the magician, shows that we are not dealing with actual tribes. As Rhygy has shown, they may be a race of dwarfs, their same prob- ably being derived from the early Welsh folk-belief in a kind of mischievous fairies (Celtic Heathendom, London, 1900, p. 601; cit. the Breton dwarf fairies, the Cerr and Corriag). The question arises whether there is not here something alluding to the stories of the battle of Tuatha Dé Danann.

In all three incidents we have a whole realm suffering from possession by the Fomorians, two, fertility, and they are destroyed, the women lose their hope of offspring, animals and vegetation are blighted, and food is stolen away. The dragon plagues of the Welsh Tuirseach, the lion, and the magicians of the Cefn Blwydd give place to each other in the sea, and is called 'the opposition of the tide of Rhy.' The

For the account of the battles, see Harl. MS 6280, text and translation, London, 1899, p. 399. Cf. D'Arbois de Jubainville, Celtic de litt. Celt., vol. II, (Paris, 1854) pp. 181; and for the probable original character of the Fomorians, see art. Cerns in vol. III. of
The activity of hostile powers of blight was naturally greater in winter, and this appears to be referred to both in tales in Irish texts which are the débris of old myths, and in popular traditional beliefs. The stories of a number of different demons, regarded as peculiarly active and malevolent at Samhain (the beginning of winter). 'Malignant bird-flocks' issue from the hell-gate of Ireland every Samhain-eve, to blight the crops and to kill animals. 'They are the souls of all kinds of beings regarded as particularly active and malevolent at Samhain, (the beginning of winter).'

DUALISM (Egyptian).—I. General.—Egyptian religion exhibits, fossilized in the different stratiﬁcations of its various religious periods, the whole series of dualistic notions that we ﬁnd to-day in all the other religions. Thus, in a good many of the chapters of the different 'Books of the Dead,' we ﬁnd traces of a pre-historic period when dualism, in the humblest sense of the term, may be seen in process of formation, and in a form analogous in many respects to what exists at present among numerous black tribes of the African continent. Every good or bad incident experienced or observed by the individual is the work of 'spirits,' visible or invisible (see DEMONS AND SPIRITS [Egy.]); every occurrence of which man feels the consequences is the action of these spirits or counters. In this Egyptian realm of primitive faith, in every other part of creation, no single spirit is speciﬁcally good or bad (generally speaking, it is the one who, being more or less pessimistic in side, is the case with the majority of savage notions); all spirits are irritable, and hungry, and simply try to gratify their instincts, which are the same as those of all other beings of the visible world. But the personal experiences gathered from generations of Egyptians, and collected by sorcerer-priests, led to the notion that these spirits were under the command of stronger spirits, or gods, who were good or bad, and that these masters are good; they are simply the controllers of beings whose attacks are feared by man.

Yet business is to try to steal from the most powerful spirits the knowledge of the means employed by them, to seize their arms, and, above all, to dispossess themselves as these very spirits themselves. Men, therefore, always pretend to be such and such spirits, in order to have more power; but such substitution does not involve any conclusion as to a permanent character of good-will or even of protection so far as the spirit is concerned in whose name they act or claim to act. Fugitive traits of dualism appear. Alliance or identiﬁcation with the most powerful spirits necessitates an attempt at classiﬁcation and the attributing to a certain number of them of the permanent characteristics of beings useful, or even to a certain extent favorable, to man. They are the so-called 'grand and good' spirits, and their alliance is formed between certain spirits and certain men, with a tendency to mutual obligations, based on experimental utility. At the same time, the classiﬁcation of 'spirits' (ancient and bad forces controlled by them) ceases to be an individual appreciation. The knowledge acquired, by traditional teaching, of the means (formule, talismans, mimetic disguises, etc.) of working upon these spirits brings into existence, for the advantage of the initiated, a list of the powers that are generally hostile or sympathetic. The use of this seems to have been reserved at ﬁrst to a social class or tribal group.

In certain chapters of the Book of the Dead, which are evidently of less remote composition, we see the properly so-called dualistic notion of a permanent conﬂict between the different kinds of important spirits very nearly taking deﬁnite separate shape, with an idea of an earthly opposition (giving, of course, the word 'earth,' or 'universe,' the very narrow sense of that patch of ground inhabited by the group in question); and, in opposition to such powers, as such a necessary part of all Nature-religions, did exist. How far that ever became a more ethical dualism is quite unknown.

Larrouy.—This is sufﬁciently given in the article. See also MacCulloch, Religion of the Ancient Celts, Edin., 1911.

J. A. MACCULLOCH.

DUALISM (Egyptian).—I. General.—Egyptian religion exhibits, fossilized in the different stratiﬁcations of its various religious periods, the whole series of dualistic notions that we ﬁnd to-day in all the other religions. Thus, in a good many of the chapters of the different 'Books of the Dead,' we ﬁnd traces of a pre-historic period when dualism, in the humblest sense of the term, may be seen in process of formation, and in a form analogous in many respects to what exists at present among numerous black tribes of the African continent. Every good or bad incident experienced or observed by the individual is the work of 'spirits,' visible or invisible (see DEMONS AND SPIRITS [Egy.]); every occurrence of which man feels the consequences is the action of these spirits or counters. In this Egyptian realm of primitive faith, in every other part of creation, no single spirit is speciﬁcally good or bad (generally speaking, it is the one who, being more or less pessimistic in side, is the case with the majority of savage notions); all spirits are irritable, and hungry, and simply try to gratify their instincts, which are the same as those of all other beings of the visible world. But the personal experiences gathered from generations of Egyptians, and collected by sorcerer-priests, led to the notion that these spirits were under the command of stronger spirits, or gods, who were good or bad, and that these masters are good; they are simply the controllers of beings whose attacks are feared by man.

Yet business is to try to steal from the most powerful spirits the knowledge of the means employed by them, to seize their arms, and, above all, to dispossess themselves as these very spirits themselves. Men, therefore, always pretend to be such and such spirits, in order to have more power; but such substitution does not involve any conclusion as to a permanent character of good-will or even of protection so far as the spirit is concerned in whose name they act or claim to act. Fugitive traits of dualism appear. Alliance or identiﬁcation with the most powerful spirits necessitates an attempt at classiﬁcation and the attributing to a certain number of them of the permanent characteristics of beings useful, or even to a certain extent favoronable, to man. They are the so-called 'grand and good' spirits, and their alliance is formed between certain spirits and certain men, with a tendency to mutual obligations, based on experimental utility. At the same time, the classiﬁcation of 'spirits' (ancient and bad forces controlled by them) ceases to be an individual appreciation. The knowledge acquired, by traditional teaching, of the means (formule, talismans, mimetic disguises, etc.) of working upon these spirits brings into existence, for the advantage of the initiated, a list of the powers that are generally hostile or sympathetic. The use of this seems to have been reserved at ﬁrst to a social class or tribal group.

In certain chapters of the Book of the Dead, which are evidently of less remote composition, we see the properly so-called dualistic notion of a permanent conﬂict between the different kinds of important spirits very nearly taking deﬁnite separate shape, with an idea of an earthly opposition (giving, of course, the word 'earth,' or 'universe,' the very narrow sense of that patch of ground inhabited by the group in question); and, in opposition to such powers, as such a necessary part of all Nature-religions, did exist. How far that ever became a more ethical dualism is quite unknown.

J. A. MACCULLOCH.
more general rule still, their character of good or bad arose from what they had accomplished by their energy (killing, slaying, devouring, tearing, etc.) in the world of gods or gods, not by their free choice, but by the fact that they were slaves, or forcibly detained spirits, in the service of such and such a master. This is the condition of most of our demons. It is a fact of their like in historic times, as may be gathered from the Thelian descriptions (paintings or writings) of the Other-world; and likewise of nearly all the genii and demons of animal aspect.

Poor as a dualistic classification is based on such processes, it is said to be as yet strange to us, nevertheless, once this point is reached, the system already contains the fundamental element—the antagonism of the forces upon which the world's progress depends. Though it seems at first a difficult thing to admit, still it may be affirmed that the mastery of the idea of a moral dualism is much more difficult to attain from this point than was the original comprehension of the idea of the antagonism of purely material order and disorder.

2. Conditions peculiar to Egypt.—A system of cosmogonic dualism like the above, generally achieved through the creation of myths, has been formulated in Egypt and in its ancient religions. But it has stopped, as a rule, among savage peoples, at the limits of ascertained knowledge, and has usually tended to end in pessimistic inaction. The future is a thing as uncertain as the present in development lies in the idea of the possible, then necessary, co-operation of man—and that without assuming any idea of a moral element; it is the much simpler case of the conviction that man can and must be the master of the sun and other beings to maintain order in the material world, and even, in a more humble way, that he can render material aid to the useful beings in their struggle against their enemies. This idea, though instinctive, cannot be crystallized without important preliminary indications supplied by Nature. These enable even elementary religions to abstract from the tumult and chaos of the innumerable phenomena of Nature a relatively clear vision of the great struggles of the elements, climatic and geographical. In this respect Egypt has been truly a privileged country (see § 5, and Calendar [Egyptian]).

In our present turn to investigate the separate elements that united to form a dualistic system in Egypt, we find (leaving out of account the innumerable secondary formations) three dualisms: (1) the Nile and its valley as opposed to the desert; (2) the supposed strife of the stars in the vault of heaven or in the invisible sky of the 'lover world'; and (3) the struggle between the sun and the powers of darkness, taking the place of the struggle of the stars. The whole becomes gradually more closely bound together.

It is difficult to decide whether the first group is the most ancient. A negative evidence seems to follow from the positive fact that the antagonism of the desert and the verdant soil of the valley is not mentioned in the ritual texts, legends, or iconography down to a very late date. Even the assimilation, affirmed throughout Egyptology, of Osiris with the valley, and of his enemy Set with the lonely destructive desert, is found, on thorough examination, to be an assertion of very late date, due to the veneration of Imhotep; and Plutarch is still the best authority to refer to in this matter.

Whatever its actual date, this 'naturalistic' division of dualism never came into the complete body of doctrine except in the form of a complementary explanation. A goody proportion of the pre-historic texts preserved in the Pyramid versions is, on the other hand, devoted to the motions and destinies of the sun. Its influence and the direct influence upon the rest of the world can be clearly deduced from an examination of Egyptian beliefs. The positions of the planets and constellations, the sudden appearance of such bodies as meteors, shooting stars, and comets, are regarded as manifestations of opposing shocks, of struggles to maintain or destroy the order of the universe. It is worth observing that, at this stage of development, the sun has very little importance in itself; its beneficent influence is hardly mentioned in the oldest beliefs, and there is, of course, no question of the sun's antagonism. This aspect can be explained, partly at least, by the small importance, in a country like Egypt, of the gradual disappearance of the heating force, or of the period in a year when it is of most use; it is, in fact, the same which is the case of any kind of beneficent activity. The Egyptian had not yet connected its visible course with the succession of the various seasons of the year—these were the work of the stars, of Sothis, the Great Bear, etc. The moon seems early to have attained a more definite character; its name of Ahi ('the Combatant') is a relic of a time when this planet held an important place in the Egyptian's studies.

On a close examination of the dualistic organization based upon the orbits and influences of the heavenly bodies, two periods can be distinguished in these times at once so remote and yet so far in advance of the starting-point. In one of these periods, the stars seem to produce a kind of group of demons and spirits who control a certain part of the celestial world—a region, a constellation, etc. (see Demons [Egypt].) And the nature of the operation is one of preventing the evil planets, constantly guarding them from the various monsters lying in wait throughout the whole firmament. (About a fifth of the Pyramid texts relate to this subject.) Groups of secondary spirits or genii, with no individual personality, are ranged around the combatants in each encounter, or are localized in a certain spot (bands of jackal spirits, monkey spirits, etc.); others, such as the humunum, form a bodyguard for the sun; and their importance decreases proportionately as the sun assumes a personality and importance for itself. These spirits gradually become groups of angels with no definite function, and in the end are practically confounded with the rays, or vital forces, of the sun.

In the second period, the antagonism of the world becomes accentuated, and the sun's beneficial protective role is defined over against a certain number of stars. These play a more active part, while the spirits of the regions fall into the background. These stars are early defined and regarded as digital, or diagnostic, signs of the day, of the dwellings of groups of spirits. They are described in the texts as accompanying the sun, preparing the way for it, defending it, battling unceasingly. Several deities of the Nile Valley, who were not stellar deities originally, show a tendency to become confused with these gods of the sky, and take a position on board the sun's barque. They all employ their time guiding the barque, reciting incantations, and pointing out dangers. The paintings of the Thelian period, though of very much later date, contain an exact picture of that period, and on the whole agree with essentials of the Pyramid texts. A steady succession of dangers (in which the pikes, harpoons, arrows, and lances of the gods play as important a part as the magic formulæ) is painfully surmounted by virtue of uniting efforts. The sun is guided, protected, and sustained, but never directed; it is not a chief; it simply submits passively to attacks and defenses. The cosmogonic order and well-being always win the day, but never decisively. For, although the sunny pole, and the forces getting into better order, so also is that of the bad gods. The conception is not yet formed that the kiospus is the personal work of the sun, but the fundamental idea is already there—that the kiosps...
DUALISM (Egyptian)

(ma'ait) depends upon the maintenance of the sun's action. On the other hand, Apophi, the single giant adversary of the sun, to begin with, gathers round him his helpers all the isolated spirits who had been wandering on their own account in the primitive struggle. These were the serpent gods of every kind, the boa (e.g., Book of the Dead, ch. 49) or serpent nafs, and all those serpents so vividly portrayed in the group of curious texts of the Pyramid of Unas against serpents; also a whole section of the crocodile gods of the marshes of the sky; and, finally, the earliest adversaries of the gods, the devils, and the sun in the heavens. The sun in the heavenly deserts, the cow, the giant tortoise, the fantastic monsters of the Theban frescoes, the gazelles with serpents' heads, etc. Thus narrowed down into a duel between light and darkness, the struggle between good and evil is imagined and described as taking place during the hours of the night, when the sun was invisible to the eyes of the Egyptians. The lower world is peopled with the god's 'friends' and 'enemies,' under the form of thousands of spirits helping or attacking the groups of gods who protect the sun in its course. The upper and lower heavens are thus peopled, like the earth, by representatives of the primitive dualism.

The evolution of this originally stellar dualism ends, after several thousands of years, in solar dualism. The sun Ra gradually ceases to be a protected god, and becomes a protector. The concept of the sun's isolation on the mountain of the hymns of the Theban period, when describing Ra (the classic sun) or Aten (the sun of Amarna religion), gives a good idea of the conception of the sun god. The fresco of Siptah and the paintings of Seti I. in the royal hypogyes of Thebes, show very well, though with too much mysticism at times, the very strenuous struggle which the sun carries on against the devils of his work; and in the world of darkness, where the 'enemies of Ra' are undergoing all sorts of punishments, the notion already appears that 'hostile' is the chief role of the sun against material light and order, but also in the struggle with everything that is in any way whatever a consequence or necessary complement of this light and order. This step, which was of the highest importance for the broadening of the nature of dualism, was due to the combination of solar dualism with the idea that the demigod Ra, the work of the after creation, through the descendants placed by the sun on this earth. If the Egyptian Ra, Lord of Order, was developed by means similar to those producing the earthly role of the Chaldean Shamash, and if the disturbers of the Egyptian ahotep are the same essentially as those of the Delta of the Emphates, this new and final element would appear to be peculiar to the Nile Valley. It rests upon the fundamental legend of Osiris, son of Ra, a god with human shape, and the distasteful hatred of his inheritors. The process of organization and civilization. Osiris, continued in Horus, left the carrying on of his task to the Divine continuations placed upon the throne of Horus—the Pharaohs, sons of the sun. See EGYPTIAN RELIGION.

The necessity of a counterpart gives rise to the romance of his struggle against Set. The slaying of Osiris, his resurrection, and his departure to the Other-world at one and the same time, shows that the sun once journeys into the lower world, and also make it possible to continue the rôle and reign of Osiris beyond the terrestrial life. At the same time, the legend of Horus succeeding his father Osiris on this earth, after avenging him, shows that the work once begun does not come to an end. In short, the fact that Set is not destroyed, but only conquered, is the solution of what is perhaps the most difficult and noblest problem in the struggle between good and evil in the world. A dualism which is confined to the origin of the world, with a struggle completed at the world's inception, cannot explain the persistence of evil. This becomes clear only when we admit that the struggle goes on indefinitely; and the conception of the battle of Osiris's successors against Set and his followers fits in with the parallel continuity of the ancient solar struggle in the celestial regions.

This parallelism gradually leads to a fusion of the characters of Osiris and Ra, which, we might almost say, was fated from the beginning. Osiris becomes one of the aspects of the struggling sun, and Ra, a means of apparently dying and returning to life. The world was, therefore, the chief role of the sun in the struggle between the forces of good and evil; and his work on the earth gets confused with the creative function of the sun. On the side of the evil forces there is even greater confusion between Set and Apophi, chief of the powers of darkness. Ra-Osiris, chief of all good forces, becomes more and more clearly opposed, as the centuries pass, to Set-Typhon-Apophi, chief of evil. The picture is completed in the last period by the assimilation of Osiris to the beneficent Nile and of Set to the hostile desert.

4. Final aspect of Egyptian dualism.—From this stage it is a comparatively easy step to the relative realization of a dualism with moral elements. The king of Egypt, grandson of Osiris and successor of Horus, in whom there lives, in virtue of his coronation, a portion of the soul of Ra, is strictly required to continue everything his ancestors have done on the earth and are still doing in the sky. The enemies of Ra and Osiris are his enemies, and, inversely, the enemies of the king are the enemies of Ra and Osiris. The gods and the people are a struggle against material light and order, but also in the combat with everything that is in any way whatever a consequence or necessary complement of this light and order. This step, which was of the highest importance for the broadening of the nature of dualism, was due to the combination of solar dualism with the idea that the demigod Ra, the work of the after creation, through the descendants placed by the sun on this earth. If the Egyptian Ra, Lord of Order, was developed by means similar to those producing the earthly role of the Chaldean Shamash, and if the disturbers of the Egyptian ahotep are the same essentially as those of the Delta of the Emphates, this new and final element would appear to be peculiar to the Nile Valley. It rests upon the fundamental legend of Osiris, son of Ra, a god with human shape, and the distasteful hatred of his inheritors. The process of organization and civilization. Osiris, continued in Horus, left the carrying on of his task to the Divine continuations placed upon the throne of Horus—the Pharaohs, sons of the sun. See EGYPTIAN RELIGION.
DUALISM (Greek).—1. The pre-Socratic pluralists. The view of the universe taken by the pre-Socratic philosophers was that the universe was materialistically monistic. This applies to the Ionian hylozoists (Milesian and Epicurean alike)—to Heraclitus as much as to Thales, Anaximander, and the others; for, though Heraclitus laid stress upon the ever-present "fire," since the explanatory term logos was to him merely an aspect of fire, it was only one side of the primary stuff or material out of which the world was formed. It applies also, although Parmenides and his followers emphasized Unity and denied Change, making the one Being and the other Non-being, the teaching is still materialistic and monistic (for the unity of Parmenides is 'corporal'), but the monism rests on the intellectual apprehension of Unity, not on the manipulation of a primary substance. It is the result of the philosophical intellect exercised on the world of our experience, as distinguished both from the scientific intellect and from the poetic imagination, as well as from mere sense-perception. In 'the Many' the intellect perceives only an illusory and a path that none can walk in, 'One'; 'the One' alone is true, and it alone exists. Dualism emerges first with the early pluralists—Empedocles, Anaxagoras, and Democritus; and it indicates the nature of the problem which was now being reached, and that the conception was clearly growing of the distinction between man as a thinking subject and the world as the object of thought. It has, therefore, both a cosmological and a psychological significance.

(1) Empedocles.—The first great principle on which Empedocles based his philosophy was that bodies in the universe, and the universe itself, consist of the four elements (he called them 'roots of things')—fire, air, water, earth; and that these are held together or kept in separation, as the case may be, by the two contrary forces Love and Hate. Regarded as a completed Sphinx, this world is conceived as broken up by degrees, through the interference of Hate or Discord, till the moment comes when Discord is supreme and chaos reigns, out of which order is again produced by the gradual influence and alternate dominance of Love, to be again succeeded by the disintegrating agency of Strife; and this alternate process goes on time without end. Here explicit expression is given to the dualistic conception of the world as composed of elements, these need to be moved; but they have no power of movement in themselves; consequently, they must be moved from without—that is, Love and Hate are needed as moveant forces. See, further, art. EMPEDOCLES.

(2) Anaxagoras.—The reputation of Anaxagoras in the history of philosophy rests mainly on two things: (1) his physical doctrine of homoeotemia; and (2) his explanation of the seemingly spiritualistic position that ὁ πάντων, or intellect, is the interpreting factor in the universe. In place of four elements, out of which everything was formed, as Empedocles had taught, Anaxagoras posits an infinite number of primitive substances, each and every one of homogeneous particles, 'which neither come into being nor perish, but persist eternally.' These Aristotelian designates ὁμοετής; whence the substantive and adjective of the same, one of the objects (of each) to designate existence by ὁμοετής and the doctrine thereof as set forth by Anaxagoras. Each homeoeometry is unique and unlike every other; yet each in its own way can exist in accord with the moveant force mixed with each. Consequently, if everything that is is mixed with everything (ὡς ἐν ὡς), a body is what it is simply because of the elements that are predominant in its structure.

George Foucart.
But the world is not explained by these conceptions alone. We require also to take account of our or intelligence. At the beginning, Anaxagoras says, "all things were together; then came mind and all things were formed in its order.

Dualism is an attempt to understand the universe as a whole and to differentiate the individual - a presentation of a teleological view of the world that anticipated Plato and Aristotle. It is the first clear statement in Greek thought that there is a plan and purpose in existence, that Nature has a meaning and is interpretable, and that physics is subordinate to metaphysics.

How far Anaxagoras himself realized the true import of his own doctrine is not known. On the one hand, he was aware of the opposition that the doctrine presents to the monotheistic idea of a God who is the cause of all things. On the other hand, he was aware of the opposition that the doctrine presents to the dualism of the Pythagoreans. The Pythagorean doctrine of the soul as the seat of knowledge and the body as the seat of sensuous perception was in opposition to the dualism of the Parmenideans. The Parmenideans regarded the soul as the seat of knowledge and the body as the seat of sensuous perception.

Duality is further apparent in Anaxagoras's doctrine of sense-perception. Accepting the principle that "that which is recognized by the senses is not recognized by the intellect," he proceeds to explain perception by the dual principle that "that which is recognized by the intellect is not recognized by the senses." He argues that the world is not divisible into parts, but is continuous and indivisible.

In early Greek thought, the Pythagoreans were the first to consider the universe in terms of its two fundamental principles, the one corresponding to the soul and the other to the body. The Pythagorean doctrine of the soul as the seat of knowledge and the body as the seat of sensuous perception was in opposition to the dualism of the Parmenideans.

It is the doctrine that the soul is the seat of knowledge and the body is the seat of sensuous perception. The soul is the seat of knowledge because it is the seat of the intellect, which is the seat of knowledge. The body is the seat of sensuous perception because it is the seat of the senses, which are the organs of perception.

This view of the body as essentially 'vile,' and a hindrance, not a help, to the soul, had great influence in Greek philosophy. It was later accepted by Plato, and it was the basis of the teaching of the mystical Greek Schools of later times—especially the neo-Platonists. See, further, art. PYTHAGOREANS.

3. Plato.—The dualism of Plato centres in his Theory of Ideas, but assumes various aspects according to the context or the point of view from which it is regarded. Besides its distinctly epistemological significance, it has a well-marked psychological bearing, depending on Plato's sharp-cut distinction between the soul and the body, and his doctrine of the soul as pre-existent as well as immortal, and the body as mortal.

Many of Plato's sayings show a dualistic tendency, and his opinion is that the final return to its original home through re-incarnations or metempsychoses. It has also a cosmological reference, both in connexion with the creation of the world, where Plato distinguishes between the soul as well as design or purpose, and in connexion with the creation of the Soul of the World and the creation of Man, whose composite nature presents a great difficulty.

(1) If, as Aristotle tells us, and as may very well be seen from a perusal of the Platonic Dialogues themselves, the three great influences that told on Plato in the formation of his philosophy were the Heraclitean doctrine of nothingness, the Parmenidean doctrine of the indistinguishability of the non-existent and the existent, and the Socratic unyielding demand for definitions and clear concepts pursued on a dialectic method that almost inevitably gave permanence to the concepts attained, the Platonic ideology naturally takes the following shape:

There are two worlds—the world of sense and the world of intelligence. The first is the sphere of change, of the fleeting and the fallacious; the second is the sphere of the permanent and the true. It is to the second of these worlds that Ideas belong; and they are not mere subjective representations, but transcendental self-subsistent entities, immutable and eternal—real independent of the existences, concrete, absolute, timeless and spaceless, and so unnominal. Being the universal, they are not derived from experience, but are presupposed as the conditions, and the ground and limit of being, but show and appearance—objects of 'opinion,' but not of 'Knowledge.' Yet sense is, and the Ideas must have a relation to it. What is the relation? Speaking generally, the answer is that Ideas are the causes of what really sense-objects possess; or, in other words, sense-objects 'participate' in Ideas. This is Plato's famous doctrine of 'participation' (phaino, or of phaino), which is intended to express the 'essence' of Ideas—known also as 'communion' (anamorphosis) and 'presence' (resomorphosis).

If, further, it is asked how sense-objects participate in the self-existent and eternal Ideas, the answer is given in the Philebus, that 'the One' is manifested in 'the Many' in a graded system of knowledge. This does not explain the fact of participation, but it throws light upon the mode. More suggestive still is the figure of 'the Line,' as representative of the cognitive process, in the sixth book of the Republic. Knowledge proper is thus shown to be absolutely distinct from opinion, which is the highest that sense in any of its forms can achieve. The Ideas of the Good is all-pervasive; while transcendent, it also immaterial; although itself above intellect and above sense, it is the cause of both (like the sun in the heavens) and permeates both. But here this should not be shown.

(2) The Platonic dualism is further seen when we raise the question with regard to Ideas, How do we come to know them? The answer to this is given in the Phaidon and the Phaedrus, and, again, in the Meno, viz., we ascribe them to a previous state of existence, the mind viewed the eternal Ideas; and, after its descent to earth and its union with the body, it is able to revive them in part. Only thus, it appeared to Plato, could we explain the facts that truth is attainable by
man at all, that learning is possible, and that virtue can be taught. There is metempsychosis (so, too, Pythagoras had said); and the explanation of knowledge is here. But our birth into this world, the union of the soul with the body, is a descent, and the full ascent is made only when the union is dissolved. Although the body is not regarded by Plato, except in the Timaeus, as essentially vile (in, to Plato, was simply a disease, arising in the souls from madness), yet it is the prison-house of the soul—a clog and hindrance to its complete development and highest perfection. It is mortal and, therefore, a restraint to the immortal, obstructing its clear vision and retarding its perfect acquisition of virtue. On the side of intellectual knowledge, it drags down the soul to the fleeting and transitory, for the body operates through the senses, and these deal with the fleeting and the changeable only. On the side of ethical achievement, it is apt to lower morality and to replace virtue by pleasure, and so to render the perception of ethical ideas faint.

There is truth in the conception of the body as lower than the soul but it is certainly not the whole truth. There is another side to it, namely, that which Browning has so finely expressed in Rabbi Ben Ezra, where it is maintained that:

"...about things
Are ours, nor soul helps flesh more, now, than flesh helps soul!"

Nor does the doctrine of metempsychosis meet the real difficulty. It does not explain how the mind that has had pre-natal sight of the eternal Ideas should come to be joined to a body at all—how the clear vision of the pre-existent state should come to be lost. As to how the soul of man came to fall from its pristine condition, Plato simply says, metempsychosis. But it at once becomes apparent that this view is incapable of keeping up with the gods in the pursuit of reality, 'and through some ill-hap sink beneath the double load of forgetfulness and vice, and their wings fall from them, and they drop to the ground' (see the Myth of the Charioter in the Phaedrus). But what rational necessity there is in this, making a fundamental difference among pre-existent souls, is not obvious. Once metempsychosis gets a start, then the fact of a partially impure life here may explain the necessity of a return, for purposes of purification and of spiritual progress, to earthly life; but how metempsychosis should be the basis of this, or, in other words, how the state of matters necessitating metempsychosis originates, is not shown. Yet this should be shown, if Plato's theory is to be rational throughout.

(3) Into the details of the Platonic cosmology as elaborated in the Timaeus, it is impossible here to enter. The problem is—Given the Platonic Forms or Ideas as eternal immutable existences, and given also the eternal existence of Matter (matter orderless, chaotic, ruled by necessity), how were the order and the beauty of the former to be imparted to the latter? The answer is that the Divine Reason, the Demiurge or Creator, produced the marvellous effect that we know as the world by working upon matter according to an eternal archetype or pattern existing in the Divine mind. According to this intelligible archetype the visible universe as it now exists, and it is the Universe itself, simply to the goodness of the Creator. The result is that the Universe is an animated rational existence, a God; having a Body (σώμα), a Soul (ψυχή), and Mind (νοῦς). Yet, this Universe is not perfect. This arose from the fact that the Demiurge, in working upon matter, met with the pre-conusical and extra-conusical resistance of Necessity (Ἀνέγγειλα). Necessity (πρέπει αὐτῷ) how could it be vanquished? Not, according to Plato, by coercion, but by persuasion. In so far, then, as the Creator could gain Necessity by persuasion, to that extent could he freely execute his design on matter; but, at the point where Necessity resisted and refused to be persuaded, the Demiurge was powerless; hence the imperfection of the cosmos. This is all right, but what is needed is the acknowledgment of a radical dualism in Plato's thinking.

Similarly, the dualistic conception comes out in Plato's account of the soul. The mortal part of him is the workmanship of 'the gods,' but the rational and immortal part is supplied by the Demiurge himself. This division of functions was necessary because nothing mortal could be created by the Demiurge, and, had man been wholly his creation, it might have been possible to cast the blame of man's sin and folly upon the Creator. As formed by the gods, man is a miniature of the cosmos—a microcosmos; but, as his constructors had only mortal elements to work with, their handiwork had flaws and imperfections in it peculiar to the situation. It was theirs simply to create the god-like and the two mortal souls: the spirited and the appetitive (τὰ ψυχικά καὶ τὰ εὐθυμιακά), and to effect the junction of these with the immortal soul, or ψυχή. As the mortal and immortal souls were antagonistic to each other, the best way to do this was to place them in such positions within the body (the skull, the breast, the belly) that the action of each upon the others should be as conducive as possible to god. This is pictorially attractive, but it does not remove the difficulty. The curious relation of the Demiurge to matter and to man, as represented in the Timaeus, is practically an acknowledgment of inability to solve the riddle of the two souls.

4. Aristotle.—The greatest critic of the Platonic Theory of Ideas in ancient times was Aristotle. His criticisms are many and various, but they all centre in the objection that the two worlds—the world of sense and the world of intellect—are left by Plato apart, and that no real explanation is given of change in the world of phenomena. Either the Ideas are an unnecessary duplicate of the facts of experience, or they are useless, inoperative. Nevertheless, Aristotle had been the pupil of Plato, and the doctrine of Ideas left its permanent mark upon him. Hence, a metaphysical dualism which, in other words, how the state of matters necessitating metempsychosis originates, is not shown. Yet this should be shown, if Plato's theory is to be rational throughout.

This dualism assumes various aspects as the different parts of Aristotle's two systems are passed in review. It is specially prominent in his Psychology, in that part of it which deals with the metaphysics of the soul (for psychology was by no means all empirical to Aristotle), and in his Theory of Virtue, or the theory of treatment of the relation of God to the Universe.

(1) The psychological dualism appears in the very definition that Aristotle gives of the soul itself, and in the distinction that he makes between soul and body. Soul he defines as 'the first entelechy [the earlier or implicit realization] of a natural body possessing life potentially': ἀριστερὰ τοῦ φύσεως πνεύματος φυσικὸς δύναμις [τὸ ἑρμηνευτικόν (de An. 412b. 27)]. The body he here regards as matter, to which soul stands in the relation of
form: as Spenser puts it (Hymn in Honour of Beauty, line 132),

‘For of the soul the body form doth take,
Form: as the body form, and doth the body make.’

‘Life is the power of the body to nourish itself, to grow of itself, and to decay of itself; so that, if for matter ‘form’ and ‘form’ we substitute ‘potenti
ty’ and ‘power’, and if we substitute the first state of actuality from the second, as we dis

This clearly distinguishes Aristotle’s view from Plato’s. Plato opposed soul to body, regarding
the latter as the prison-house of the former, and allowed only that the body could be trained
in gymnastic and music to obey the soul. To Aristotle, on the other hand, the body is the
natural instrument of the soul, and so is pre
dominantly the more necessary to form the
concrete particular which we know as the in
dividual human being. Yet, Aristotle adds:

‘It is, however, perfectly conceivable that there may be some particular soul which belongs to
the body, and this because they are not, the expression or realization of any partic
ular body. And, indeed, it is further matter of doubt whether being is the exact re
solution of the body may not on the other hand stand to it in the same separable rela
tion as a sailor to his boat!’

Dualism comes out sharply when Aristotle
reaches the handling of the highest function of
the soul, viz. intellect or nous, where he discrim
inates between the active and the passive nous, and
between nous prinopos and the other psychic
functions. His scheme of functions, beginning
with the lowest, is: nutritive or vegetative soul
(ro droskopos); sentient soul (ro dphptrikos), includ
ing the conative soul (ro dphmikos), which he sometimes
makes a separate function; and intellectual or
noetic soul (noos ro noetikos), divided, as above,
into passive noos (noos dphptrikos) and active noos
(noos noetikos). Each higher function presupposes
the lower, though the lower does not presuppose
dependent on the body.

Thus, the sentient soul presupposes the
vegetative soul, and both sentient and vegeta
tive souls are presupposed by the noetic soul; but
the vegetative soul, or more strictly, the sentient
soul, and not the sentient presupposes the noetic.
It is characteristic of noos that it is eternal and
immortal—at any rate, this applies to the active
or poietic noos; it is introduced into the individual
human being ab extra, and the difficulty is to find
what connexion it has, on the one hand, with the
passive noos and with the other functions of the
soul generally, and, on the other hand, with the
body. As has been said above, it is distinctive of
Aristotle that he recognizes the intimate and indis
soluble relation of soul to body, and the necessity
of taking account of the physiological as well as of
the psychical aspect of mental facts and processes.

His great objection to dualism is, that the transmig
ration of souls was that it assumes that any body is suitable to any soul, whereas the
human body is specially fitted for the soul. To
maintain for soul in form, and deny the body in
saying that the carpenter’s art ‘clothes itself in flues;
the truth being that, just as art makes use of its
appropriate instruments, so the soul must make use
of its body’ (De An. 410b6, 25). But,
when he comes to treat of the active soul,’ it
is a different kind of soul’ (noos) from the others, and ‘it alone admits
of separation, as the eternal from the perishable’
(kadpentr to dhlion to phlogeo).

Still further, the dualism of form and matter
enters into Aristotle’s theory of sense-perception.
(2) The theoretical aspect of the concept of the
dualism has been brought out in the art. DESIRE
(Greek), and need only be referred to here.
On the one side is God, who is the prime unmoved
movent, to which the universe evermore looks desiderating;
and on the other side is the world, though dependent on the Deity and derived from
Him, is, nevertheless, regarded as not created at
one particular time but as eternally existent.
This might be interpreted as simply Aristotle’s way of indicating his belief in impersonal reason
as permeating the universe, and yet he at times
has glimpses of a personal God, apart from the
world and ruling it, as a general does his army.

We must consider also, he says, in which of two ways the nature of the universe contains the good or the highest
being, whether as something separate and apart from
the parts. Probably in both ways, as an army does. For
the good is found both in the order and in the leader, and more in the
latter; for he does not depend on the order, but it depends
on him’ (Met. xii. 10. 1075b, 16).

Moreover, Galen in himself conceived by Aris
totle as Thought, and God’s Thought is defined as
‘the thinking upon thought’ (aiv ton tov noetikou
nous) (Met. xii. 9. 1074a, 30). Personality
is involved in this.

5. In later Greek systems.—Besides the dualisms
that have been now considered, it is to be observed
that there is frequently a dualistic note in Greek
monism, which need not, however, be more than
adverted to here. This applies particularly to the
post-Aristotelian schools. For example,
Stoics found a difficulty in adjusting their doctrine of
the primitive material substance ‘fire’ to the require
ments of man’s rationality; and, in especial, the
neo-Platonists disclosed a distinct dualism in their
system of the Absolute when they came to evolve
their famous Triad of Absolute Unity, Absolute
Intelligence, and Absolute Soul, and therefrom
matter and all that is finite (see the neo-Platonic
section in art. DESIRE [Greek]). The problem of
how to derive Matter from Mind on a mystical
basis is a difficulty that is inherent in every doctrine
of Emanation and seems to be insurmountable.

SUMMARY.—We have now described the leading types of dualism in Greek phil
osophy. The term ‘dual
ism’ is one, but it has diverse signification.
(1) It has a cosmological application, as is seen in the
vocative use of the term by Aristotle in the meaning
of separation as that of the noos in Aristotle.
(3) It has (a) a metaphysical application, as expressive
of the doctrine which maintains that there is a dis
parity between Mind and Matter and the impos
sibility of reducing the one to the other, and
designates the opposite of monism; and (b) an
epistemological application, as in Plato’s grand
attempt to explain the possibility of knowledge in
his Theory of Ideas and in Aristotle’s doctrine of
Form and Matter. (4) There is an application of
the term that is ethical and religious, which has
reference to the dualism between the human
body and the soul, and to the view that the body is a clog
or hindrance to the development of the soul and
may be the seat of sin and degradation.

Lastly, there is a theological application, when
when as by Plato in the Phaedo, this is in
volved as the product of opposing principles—God
and necessity—and an explanation is offered of the
seeming defects in creation which shall minimize
the difficulty of a purely teleological rendering of
the universe. These various meanings, though not mutually exclusive, are distinct, and they should be kept distinct, if the positions of the Greek thinkers are to be understood.

Lewis Carroll—Practically all the books and stories of Lewis Carroll are set in a world dominated by dualistic concepts.

The Wittenberg churchyard—The churchyard of Wittenberg is a significant location in the history of Western thought.

The Battle of Parnassus—The Battle of Parnassus is a famous literary event.

The dualistic universe—The dualistic universe is a central concept in various philosophical and religious traditions.

DUALISM (Iranian)—A tendency towards dualistic conceptions, or, perhaps we may say, towards bilateral symmetry, seems to be an essential characteristic of the Iranian mind. This is to be seen in the constantly recurring distinction of the 'two worlds,' the world of Spirit and the world of Matter—a common concept in the Gathas (e.g. Veda xxix. 5); or, again, in the two lives, the present and the future (cf. Uvēsīya...ahūya, st. lvii. 22; ubōyā ahvīvy, st. xli. 2). This symmetrical dualism, or 'polarity,' as S. Leing would probably style it, finds quaint expression in a curious diagram, attributed to the celebrated minister of Yazdagird I., Atrapat, preserved in the Dinkort (iv. 137, ed. Peshotan, Bombay, 1883), which is represented thus:

![Dualism Diagram]

It will be seen that this curious table divides the whole notion of being into two correlative worlds of Spirit and Matter, with terms relatively corresponding to one another on opposite sides of the central notion itself. But the religious dualism which is ordinarily considered to be the chief characteristic of the Zoroastrian religion. Yet there is no point in connexion with that faith which has given rise to so much controversy among both native and Western scholars. The modern Parsis stoutly deny that their faith is, or ever was, dualistic; and a similar view is held by more than one distinguished European authority.

E. W. West attempted to defend Mazdaism from the accusation of dualism, 'made in good faith by Muhammadan writers, and echoed more insistently by Christians,' though he blames the Parsis that they for themselves for having admitted it, at least during the Middle Ages (see 'Pahlavi Texts,' p. i. in SBE, vol. v. p. lviii f., also pt. ii. lb. vol. xviii. p. xiv). Quite recently J. H. Moulton, in a lecture on Mazdaism, asserted that 'there was never anything that could be called dualism. There were two powers, it was true. We were told that in the beginning one of them chose good and the other chose evil. They began a long, continuous struggle, which was to go on to the end of time, but the end was to be the final destruction of the power of good and the final destruction of the power of evil. That was not dualism. If it was, Christanity could not be reconciled with it.'

It appears to the present writer that the whole question is one of terms. It cannot, of course, be denied that the Supreme God of the Avesta is Ahura Mazda, conceived as essentially good, and the author and creator of all that is good, who is also repeatedly spoken of as Spenta Mainyu (the Holy Spirit), and that in opposition to him is Ahrā Mainyu (the Destroying Spirit). These two opposing principles are, of course, the Ormazd and Abrāfin, respectively of later Persian literature. As is well known, the whole religious system of Mazdaism may be said to consist in the perennial warfare between these two powers. Certainly the mere fact of the antagonism between a good and an evil spirit and their respective followers would not of itself constitute a real dualism in the Avesta, any more than in the Christian, system. But the real point of the matter is that, according to the Avesta system, (1) there exists a Being, evil by his own nature and the author of evil, who does not owe his origin to the creator of good, but who exists independently of him; and (2) this Being is an actual creator, who calls into being creatures and those of the Good Spirit and contrary to his will.

Here is seen the fundamental difference between the Avesta and the Christian (or Muhammadan) theology. In the latter the evil spirit, so far from having an evil independent of God, who is actually His creature, though fallen and rebellious, and certainly is never conceived as creating any beings whatsoever. The distinction seems to be decisive. So far is the idea of the creative power of the evil spirit carried in the Avesta, that not only is Ahrā Mainyu represented as creator of a vast host of demons (daeva), but even this physical world and its inhabitants are divided into creatures of the good and the evil spirits respectively—to the latter being attributed cold, sickness, and even noxious animals, such as wolves, poisonous snakes, etc. The very beginning of the Vendidad is an enumeration of the various plagues created by Ahrā Mainyu in opposition to the various lands and countries created by Ahura Mazda, a special verb (fra-kerb, translated by Darmesteter as 'counter-create') being employed in opposition to the verb ag, attributed to the good spirit. This conception of a double creation was continued, and even enhanced, during the post-Avestan, or Patriotic period, as it has been termed. Even among the heavenly bodies the elements are considered as creatures of the evil spirit and opponents of the constellations and the stars created by the good spirit. Similarly in some of the Pahlavi treatises, the pole is divided; the lists are given of the animals, arranged in two hostile armies, among those of the good creation being the falcon, magpie, crow, kite, mountain-ox and goat, wild ass, dog, fox, etc., whilst the serpent, locust, wolf, and intestinal worms are of the evil creation. There can, we think, be no doubt that all through the Zoroastrian system, from the Avesta down to the Pahlavi theologians, the evil spirit is considered as one with the Creator, and for a reason, even apart from the question of his origin, the system may justly be termed dualistic. It is quite true that, according to the general teaching, Ahrā Mainyu and his hosts are to be entirely and utterly destroyed at the last day, but it can scarcely be denied that, at least in the original system, his origin is quite distinct from that of Ahura Mazda, and that the two-spirits are co-existent, from eternity. We have here a Zoroastrianism limited and modified by dualism, as well as a dualism modified by an ultimate monothelism. These theories may seem to us inconsistent. No doubt the origin of evil lies here in the struggle between the principal divinities, which all religions have had to face, and the form given to this solution character-
izes the divergences which distinguish them from one another. Mazdeism of every age has sought this solution in the doctrine of two independent hostile and diametrically opposite principles—the principle or spirit of Good, and the principle or spirit of Evil. The consistency which we require in such a solution did not fail to present itself to the Iranian mind, and from early times we find that theories were devised as a means of escaping from the difficulties of this dualism. These may be grouped generally under two hypotheses: (1) that the two spirits have sprung from a single, indifferent, pre-existing source; (2) that the Evil Spirit proceeds from the Good Spirit, by generation or creation. The former is the doctrine of the Zervanists, the latter that of the Gayomartians. The Zervanists, according to the descriptions preserved by the Armenian historians, went back to a primal being, Zervan Akarana, lit. ‘Universal Time,’ sometimes apparently identified with Destiny; and this prordial being was supposed to have generated both Ormazd and Ahriman. Zervan, however, seems to be thought in the mind of the produced by an evil spirit, the ‘evils’ or the ‘lilith.’ The Good Spirit. This is practically the solution of the modern Parsees, who make a sharp distinction between Ahura Mazda and Spenta Mainyu. They point out that, especially in the Gathas, Ahura Mazda is constantly opposed, not to Ahura Maalez, but to Spenta Mainyu. Ahura Mazda, the ‘blessed and primary spiritual and sole creator. He is, however, possessed of two ‘faculties’—Spenta Mainyu, or the faculty whose function is beneficent, and Ahura Mazda, whose function is destructive. One cannot not on the first a single monotheistic suggest in unambiguously suggested by the Hindu doctrine of the functions of Vigna and Siva in the Hindu triad. A quite recent Parsee theologian has advanced a new theory, holding that Spenta Mazda and Ahura Mazda denote the good and evil spirits respectively of man, and not of the Divinity (Rastamji Edulji, Zarathushtra and Zarathushtrianism in the Avesta, Leipzig, 1906, pp. 140–159); but we are not aware that this is anything more than a peculiar view of the author. It is an approximation to the Christian doctrine of the origin of evil in the free will of the creature.

LITERATURE.—E. W. West: ‘Pahlavi Texts,’ pars i. ii. in S.B.R.P., vol. iv. ii. (Oxford, 1880); C. de Harlez and J. Piq, Pahlav. Lex., Paris, 1891, Introd., par. lxxviii–lxxviii; A. V. Williams Jackson, ‘Die iran. Religion, or the Avesta’ (I. ii. 1890) 483–487 (Dualism is a characteristic trait of Zarootser’s faith, and in its widest sense—whatever its ultimate source—was undoubtedly the product of his own genius. This dualism is monothetic and optimistic, in that it postulates the final triumph of Ormazd and the destruction of all evil); L. C. Casartelli, Ph. D. of the Magada- yanist Rel. under the Sassanids, Eng. tr., Bombay, 1889, pp. 50–54; ‘The Zarathushtraic Theology of the Present Day,’ in Babylonia and Oriental Record, vol. v. (1900) 222–229; embodying a ‘nineteenth century reconstituted’ by a modern Parsee theologian; and all the writers on the Avesta and Zarathushtrianism. Cf. Literature at end of art. AYTRA.

L. C. CASARTELLI.

DUALISM (Jewish).—Traces of a belief in two conflicting supernatural beings striving for the mastery are nowhere found in the pre-exilic writings of the OT. In the oldest religious belief of the Israelites, Jahweh’s jurisdiction extended over all nature, and Jahweh meant not war with any neighbouring god or demon. There was no evil spiritual being endeavoring to subvert His moral government. While dualism ascribes evil to a divinity, the ancient OT did not find any difficulty in making it emanate from Jahweh Himself (cf. Am 39). No doubt the Israelite was subject to the same psychological laws which raise a horror of the dark and of uninterrupted and desolate places, and horror with malicious hurtful beings than are recorded in the OT; but his mythology was of his own creation and associated with his surroundings. Observing a multiplicity of wild life on the edge of the desert, such as monstrous serpents, jerboa, and wild goats, his imagination searched them with intelligence, and assigned them a habitation in the interior of the desert. There arose the ists, the ‘satan’, the ‘lilith.’ It is doubtful, however, how far he considered them as ‘sublime.‘ They were physically injurious to man when he entered their domain, but did not come into his religious and cosmic views. The monotheism of the OT writers kept the popular beliefs in demonology or belief in demons in the background. The solitary mention of Azazel (q.v.), to whom a goat was sent out on the Day of Atonement, is too obscure to justify any conclusions as to the origin of that rite or the person of Atonement. In Lv 16 the act is viewed as symbolic of a transference of the nation’s sins to another land. The nature and habitation of Azazel are left undefined, as if unknown or of no consequence. Nor is the OT an independent Divinity. The root signifies ‘to oppose’ (by standing in the way), not necessarily in a bad cause. In Nu 22:27, 28 the angel of Jahweh was a satan to Balaam. A personal satan occurs first in passages of the later stages of the Old Testament. Satan is a person, not a eter)

Nor is the OT an independent Divinity. The root signifies ‘to oppose’ (by standing in the way), not necessarily in a bad cause. In Nu 22:27, 28 the angel of Jahweh was a satan to Balaam. A personal satan occurs first in passages of the later stages of the Old Testament. Satan is a person, not a eter)
Already in Tobit (3)—an early pre-Maccabean romance—an evil spirit, no longer, according to Hebrew, from Jehovah, but of foreign origin, slew seven innocent men. Asmodaeus was banished by migration into the wilderness of Egypt, but survived in Jewish tradition as king of the devils. Yet, as against the power of evil spirits (Ber. 51), has been conjectured to be the Smeros of the Avesta, who contends with the Devas night and day (Yasna lix. 10-23; cf. Trea. Avest. Eschat. ii. 10; Tübingen, 1808, p. 339). But it is not he who causes the cock to herald the approaching light, but 'Blessed art Thou, O Lord our God, King of the Universe, who hast given to the cock intelligence to distinguish between day and night' (Daily Morn. Pr.).

The contest in favour of monotheism was carried on by the Rabbis in their combats with Magianism, Gnosticism, and the Minim who believed in two powers, a duality in the Godhead (Friedländer, Die relig. Bewegungen, Berlin, 1905, pp. 193-234; Bergmann, Jud. Apologetik, Berlin, 1908). The Minsha enacts that God should be blessed for evil no less than for good (Ber. ix. 5). A reader in the synagogue should be silenced if he says, 'Thy name be remembered concerning good, or 'We praise Thee, We praise Thee' (ib. v. 3). 'Whosever of angels or spirits, if another object is rooted out of the world' (Suk. 45b). In the Passover service the redemption from Egypt and the slaying of the first-born are emphatically stated as accomplished by God in person: 'I am the Lord thy God, and I am not a scribe, and I am not a messenger."

The strong assertions of the Divine unity and the all-importance of legalism left no room in the Halakhia for Satanology. Hence the Mishna is free from it. Where Satan does occur in the Haggada of the Talmud and Midrash, the description is coarse, puerile, and inconsistent. At one time he is a fallen angel, at another an evil spirit, from heaven, 'he caught hold of Michael's wing,' but the Holy One, blessed be He, rescued Michael (Yalk. Shim. 68; see Kohn, Angelologie, 1886, p. 63). Then he is the 'Great Prince in Heaven' (Pirke d. R. Eliezer, 13); he is also Michael being seeing, he is called, 'the poison of God,' because of his identity with the angel of death. The Qabbala and the mediaval Mystics restored Satan to his ancient greatness and dignity. The pious and puerile, still said by some Jewish communities on the Day of Atonement, reads like a chapter from the Avesta.

If the person of Satan is undefined in Jewish theology, the existence of the yēser ha-rā (in Dabb. bithra, 166, identical with Satan and the angel of death) is a Jewish dogma. This theologomenon is based on the yēser of Gn 3:19, rendered in the AV 'imagination,' and connoting that faculty of the soul which is the cause of rebellion against God. The yēser became very early hypothesized in Jewish theology (cf. the antithesis in yāser  yēser yēser), 'Woe to me because of my tempter' (Jer. 6:28). He is the 'strange god' of Ps 81:1, dwelling in man (Shabb. 105a). As the source of sin, he was already known to Sranach as erēna (211'), ḫī?ytna (37'), rā陌生人 (156), and others in the Apocrypha, where human dichotomy is asserted, such as Wis 10:1, an approach was made towards metaphysical dualism; yet the spirit of legalism checked its further development. Where, as the very virtues of the wicked ( 1 eunomies) are vices in the eyes of the righteous (Yeb. 103a), a Jew can keep the Law and be sinless. 'Blessed are Israelites. When they are occupied with the study of the Law and the performance of good works, the yēser is delivered into their hands, and not they into the hands of the yēser' (Abod. zara, 5b; Kid. 30a; cf. Sir 21:1). He is not a human faculty and therefore not ante-natal, but an adjunct

1 The substitution of 'all' for 'evil' is for the sake of euphony (Ber. 116), probably also from an aversion to terminate anything with a word of evil omen.

DUALISM (Jewish) 113
at birth (Senk. 916). He is situated at the left,1 the other dem ez machin, the yerer (ob, being at the right (T. an d. 11u). According to Ber. 61d, he resembles a fly,2 and is placed between the valves of the heart. He was Divinely created for a benevolent purpose. Unless he existed, 1 man would build a house, or man or woman children, or there was no life of the earth (Gen. R. 80). At the end of the world the God will slay him in the presence of the righteous and wicked (Suk. 525).

DUELLING. — I. Under civilization. — Although early Schoolmen declared that the judicial duel was Divinely instituted when David fought Goliath (1 S. 17), the point never ceased to trouble the early Christian Church. Their investigation of the sanctity of the highest antiquity, the origins of the duel elude definite ascertainment as completely as do the various ordeals among the oldest peoples, of both East and West. Found in various forums, from Japan to Ireland, and from the Mediterraneoan to the northern latitudes, it was yet no universal practice, but mainly European 'where the hazel grew', and its traces are scattered. The solemnities preceding the single combat of the Celts and Romans (U. iii. 38 ff.) are marked indications of ancient custom and ceremonial in Homerian times. Historie Greek examples fall, but the usage existed among the ancient Umbrians and among the Slavs (Nicolaus Damascenus (Didot, Frag. Hist. Graecorum, iii. 457); Kelly, Hist. of Russia, London, 1878, pp. 33, 53; Lea, Superstition and Force, Philadelphia, 1892, pp. 108, 110). While the legends of the Greek, battle of the Horatii and Curiatii (Livy, iv. xxiv. f.) may point to an archaic practice among the Romans, the system of trial by battle has neither any tradition in the fragments of early Roman law nor any countenance from the jurists or the code. Roman civilization knew the duel as a Barbarian institution. Scipio Africanus (206 B.C.) met it in Spain (Livy, xxvii. xxi.); it flourished among the Celtic and Germanic tribes (Velleius Paterculus, ii. 117 f.; Paulus, Germ. 16); and a particular tradition, unusually circumstantial, associates it with the Burgundians, and ascribes its revival to King Gundobald (A.D. 501) as an anticy to forewarn the efforts induced by Christian compurgation (Leges Burgundionum, ut. xiv.). Wide diversity of application and form existed; but, with the overthrow of the Empire, the duel as part of the Barbarian code became a sort of common law in Europe, fostered by the martial traditions which were developing into feudalism and were to culminate in chivalry.

Norse sagas have many records of hölmings (as an anticy to forewarn) induced by Christian compurgation (Leges Burgundionum, ut. xiv.). Wide diversity of application and form existed; but, with the overthrow of the Empire, the duel as part of the Barbarian code became a sort of common law in Europe, fostered by the martial traditions which were developing into feudalism and were to culminate in chivalry.

Welsh laws. Ireland knew the institution as coronc or coronc firi tierer ('battle against one man') cf. Joyce, Soc. Hist. of Anc. Ireland, London, 1903, 1, 152—54). Singularity enough, the evidence for the duel in England prior to the Norman conquest has failed to satisfy the historians. Thus, while elsewhere, through the influence of Christianity, the duel was in great part exterminated (e.g. Iceland in A.D. 1006, and in Norway in 1012), in England there is the anomaly of its not becoming an undoubtedly national mode of trial till half a century later; the Conquest is said to have introduced it; that it was unpopular with the English is a current inference without a very solid foundation. The laws of William the Conqueror gave an accused person, whether Norman or Englishman, the option between ordeal and duel, reserving a third choice of compurgation (p.e.) to the Norman. The earliest English instance recorded is dated 1077; Norman examples occur forty years earlier. In that epoch it had a very wide application, both in civil matters and in charges of crime. In character it was, by its essential feature of self-help, not really an ordeal. How elaborate was the tradition for the forms of the duel as well as for the substantial law? The question of the early Englishman is raised by the Assises of Jerusalem, drawn up by Godfrey of Bouillon in 1099 for the Latin kingdom established by the First Crusade. This ordinance is equally full and precise regarding the modes of trial, the causes and conditions, the oaths against magic, and the distinctions of rank, whereby only knights fought in mail on horseback with helm and lance, while common folk fought in jackets (bliaud), on foot, and with cutlass.

Before the close of the 12th cent. the jurisdiction of the duel was considerably restricted in England by Glanvil's 'great assise,' a sort of magnified jury. The tendency expanded; gradually the duel was superseded in civil causes except land-rights; burghal charters from Henry I. to Henry III. gave numerous exemptions; and by the time of Edward I. the practice was largely confined to trials on the writ of right to land and to 'appeals' for manslaughter and serious crime. Although trial by jury grew fast, the duel was long to remain. The importance of land litigations explains the origin of the professional 'pugil,' or champion, kept sometimes at a regular retaining fee by a religious house. 'From the quilk conneutude,' said Sir John Skene (Exposition of Difficult Words, 1597, s.e. 'Campion'), 'omnis the common saying.

'Do thou rich, do thou strong, Chels thor a champion strong.'

In criminal cases a kindred but more corrupt product was the 'approver,' an informer, frequently infamous, who in making his charge underwent the risk of a challenge to battle. The loser in appeals of battle, being convicted of perjury by the fact of defeat, was hanged; and there is extant a contemporary picture of an approver who thus came to the bad end he had earned (Maitland, Select Pleas of Crown, Selden Soc., London, 1888).

From the 9th cent. the Church was continuously decrying the duel, and duelling simultaneously giving it countenance. The latter process took many forms, one being the acquisition of jurisdiction by ecclesiastical dignitaries over trials by combat. Perquisites of court deduced even clerical minds from the trials. Sometimes a demur of the law courts fought duels in person, and it was as hard to stop the practice as to keep churchmen from bearing arms in war. A Glasgow pontiffal in 1180 includes the liturgy of annual fasts for bearing the shield and baton for a duel, and some saints were esteemed especially efficacious to be invoked for success in such combats. In the First Crusade,

1 Hence his name in the Zohar, וְיָדָו, 'the other side,' 'sinister.'

2 Like Ahbram in the Avesta.
Peter the Hermit himself bore a challenge for a duel of ten, six, or three crusaders against an equal number of Saracens (Taraneti, cap. 81). As usual, practice beclothe precept, and anathema was assailed as a equivalent on the duel in the 15th cent. (Olivier de La Marche, in Traité du duel judiciaire, ed. Prost, Paris, 1872, p. 44) declares that ecclesiastics, like other people, were bound to fight if it involved a point of the faith. The sanctions of the duel occasioned much deep discussion. Nicolas de Lyra wrote a treatise on the ancient precedent of David and Goliath; Cain and Abel admittedly furnished a less satisfactory example.

Until the end of the 13th cent. the duel was a duel of law, but in the 14th it blossomed anew as a duel of chivalry, once more emphasizing its aristocratic and military impulses. The duel, rapidly decaying in other matters, became the fashion for appeals of treason, and this newer chivalric duel took on fresh splendor, especially in the courts of England and France. An important ordinance of England and France in 1396 was a characteristic code, containing regulations most of which passed into general use in chivalric courts. Notable editions of such duel codes were those compiled in the beginning of England under Richard II, and the reproduction of it in the Order of Combats preserved by the Constable of Scotland from a MS belonging to James I. The formalities were evidently known to Chancer, who reproduced them in the Knight's Tale.

There had arisen in that new epoch the private duel, as distinguished from the duel under form of law or chivalry. The Fair in 1306 was a curious institution, fostering the code, and its reproduction of the duels that the Constable of Scotland from a MS belonging to James I. The formalities were evidently known to Chancer, who reproduced them in the Knight's Tale.

Mere tilting matches, different as they were in principle from duels, are easily confused with them, especially when they were 'jousts of war,' in which the combat was a symbolism of the chivalric ideals. Some of these are historic, such as the 'Combat des Trente' in 1351 between thirty Bretons and thirty Englishmen. It is the subject of a French chanson de geste, and its interest is the greater from its having supplied a model for the clan duel (in 1366) of thirty Highlanders of Clan Chattan against thirty of Clan Kay. Not a few fruitless challenges of 100 knights against 100 are extant, and there were many actual duels of numbers, such as of 13 Frenchmen against 13 Italians, and 7 Frenchmen against 7 English. The duel, strictly construed as a combat of two, adjudged by and fought before a court, invariably noble and largely royal, had long a distinctive chivalry for trials of cause in cases of treason, where legal proofs were inadequate. It suited the times. Fourteenth century England devised a Court of Chivalry in which the historical importance of the duel culminated in the wager of war between the Dukes of Hereford and Norfolk in 1308. This duel was stopped at the onset by Richard II, who arbitrarily and illegally exiled both combatants. Hereford returned from his exile next year to depose Richard and take the throne as Henry IV, and it was he who at his coronation jocously assured his champion that he would himself see to the defence of his right to the crown. The 'champion of England' was one of the institutional inventions of English chivalry in the 14th century.

Meanwhile, alongside of chivalry the old duel of law was extensively practised. The Law in the 13th and 14th cent. had no shudder for its brutality, and Bracton could calmly record (de Legibus Anglie, ed. 1640, fol. 145) that the loss of a front tooth maimed a man and gave him an excuse for dueling, and that death bore much to its victory. Pitiful records in the 15th cent. show this, gruesome enough, to have been literal fact, for graces attendant on chivalry encountering before kings were absent when humble combatants in inferior courts maned each other with latan or 'hiscorne,' and tore each other with their teeth. One does not marvel that Pope Nicholas, in 867, had denied the Divine institution of the duel, but one does marvel that nearly seven centuries afterwards, John Major's protest, that 'God did not settle questions in that had well authority on the duel in the 15th cent. (Olivier de La Marche, in Traité du duel judiciaire, ed. Prost, Paris, 1872, p. 44) declares that ecclesiastics, like other people, were bound to fight if it involved a point of the faith. The sanctions of the duel occasioned much deep discussion. Nicolas de Lyra wrote a treatise on the ancient precedent of David and Goliath; Cain and Abel admittedly furnished a less satisfactory example.

Until the end of the 13th cent. the duel was a duel of law, but in the 14th it blossomed anew as a duel of chivalry, once more emphasizing its aristocratic and military impulses. The 'champion of England' was one of the institutional inventions of English chivalry in the 14th century.

Meanwhile, alongside of chivalry the old duel of law was extensively practised. The Law in the 13th and 14th cent. had no shudder for its brutality, and Bracton could calmly record (de Legibus Anglie, ed. 1640, fol. 145) that the loss of a front tooth maimed a man and gave him an excuse for dueling, and that death bore much to its victory. Pitiful records in the 15th cent. show this, gruesome enough, to have been literal fact, for graces attendant on chivalry encountering before kings were absent when humble combatants in inferior courts maned each other with latan or 'hiscorne,' and tore each other with their teeth. One does not marvel that Pope Nicholas, in 867, had denied the Divine institution of the duel, but one does marvel that nearly seven centuries afterwards, John Major's protest, that 'God did not settle questions in that had well authority on the
is a determinant of public life. Among German students it has sunk to a rather savage athletic sport. Elsewhere generally a court duel has run, another running, a course parallel to that of private wars—possibly prophetic of that of national wars. Its endurance is determined, not by enactment of law, but by the thought and purpose of the courts, which is bound up with the ideas of private revenge and family blood-feud, not with the conceptions of a State with justice as its primary function. It is instructive, therefore, to compare briefly the law in Britain and in England. In each country certain courses of conduct are called duelling. In Great Britain the duel has in general, since King James's edict, and more particularly during the last century and a half, been treated with far greater severity than was shown to it elsewhere. In this country practically alone is it now the law that to kill in duel is murder, involving the capital penalty. In almost all the rest of Europe this stringency holds only when traditional rules have been in force, for instance, contrasted with the slight repression made in France. Bentham (Works, London, 1843, i. 579, 543), soberly balancing the merits and demerits of penal policies in general and "honorary" satisfaction in special, points out the partiality, uncertainty, and inconvenience of the duel considered as a punishment, although he thought it might be proper to be indulgent to it if the alternative was revenge by poison or the sword. Duels, he pointed out, were less common in Italy than in France and England, but poisoning and assassinations were much commoner. Like the historian Robertson, Bentham as a moralist thought that duelling tended to preserve "politeness and peace," and seems to have had little foresight of its swift decline. In recent times, the conditions, e.g. in France, often appeared to ensure immunity from injury but not from ridicule. The facts seem to justify the inference that for once British laws have had only—by repression of the duel and by adequate civil repression for injured honour—too much leniency to make that at all unnecessary. Frapper for sur la bourse, c'est frapper juste is the dictum of a modern "docteur dueliste" (Croshhob, op. cit. infra, 339). In Britain the spirit of trial by jury has proved a better guardian even of honour than the sword. Perhaps it is not among the things they manage better in Germany and France than we men continue, in however restricted a degree, to condenunce the duel, which ranks among the least barbaric inheritance among the institutions of the European. Probably Bentham himself did not sufficiently reflect that what had so long been abandoned by France, was, if anything, more actively and irritatingly mode of justice, where substantial interests were concerned, stood thereby already grotesquely out of court for the finer task, in modern civilization, of healing the sores of honour.

Significant among recent tendencies, illustrating some of the foregoing views, have appeared in Germany, the centre of modern militarism, especially since 1897, when Bismarck by a Cabinet Order declared his wish that duels among officers should be more effectively prevented by resulting private quarrels to Councils of Honour with appeal to Courts of Honour, commanding officers, and the Kaiser himself. These Councils of Honour for a regiment consist of all the officers, which the Courts of Honour comprise all the officers. This order by its terms did not prohibit duelling, but it enlarged the province of Courts of Honour. Reconciliation by intervention of such Councils and Courts, however, was, and still is, done, permissible only in cases of the honour of the class to which the officer belongs or by good causes. At first hailed as an abolition of the duel, the order was soon found to warrant any action, and in 1897, and since, have pointed out that the Kaiser never departed from the renunciation of the duel, which in affairs of honour; they bluntly stated that the so-called Council of duel of 1897, found a way in which the order would entirely depend for its efficiency on the spirit of the offencive, and that it was powerless to anticipate the crystallization of so deep-rooted a practice as a duel in one stroke. Yet the order was recognized as a very considerable attempt at restriction in the army. It was subsequently made applicable also to naval officers.

The critical forecast was justified by events. Scandals continued to arise, and duels over duel again in very serious and fatal consequences. In 1901 sharp controversy sprang from the discovery that, in violation of an imperial order, candidates for choice as officers in the reserve had been subjected to questions regarding their opinions on duelling, and had suffered prejudice for adherence to the practice. The Minister of War declared in the Reichstag that, while duels were justifiable for such cases as charges of cowardice, insult by violence, or impugnation upon an officer's moral integrity or family honour, everything was done to prevent the duelling of the able. These measures, but did not satisfy those of officers who protested that every officer punished for taking part in a duel should be dismissed from the army. Afterwards, in the same year, a manifesto was infallibly signed demanding the prohibition of all duels and the institution of Courts of Honour in their stead. It was expressly urged that this was the only practical method of curbing duelling and that prevention was to afford more effective legal protection against attacks on the person of individuals. Direct legislative action does not seem to have followed, but the agitation has served a useful purpose in elevating public opinion in Europe.

GEORGE NELSON.
When a girl is found to be pregnant and the man whom she accuses denies his share in her guilt, each of the pair is given a knife, the one first wounding the other is dismissed, and the other is allowed to participate in duels (a privilege normally reserved for the male sex), their opponents may be compelled to have some handicap, as when, in old Bohemian law, they were obliged to stand in a pit divided in the ground. Elsewhere, however, as among the Slavs and Bohemians, the services of a champion were expressly forbidden, on the ground that a man really innocent might be killed.

The cycle of development of the duel would seem to be somewhat as follows: in its ultimate form it is simply a fight, more or less serious, between two men concerning some real or fancied injury. From this point of view it is precisely like any modern fight between two men for the settlement of some difficulty between them, or even for mere revenge. But at an early time the duel became the battle of champions fought for the welfare of society, with various restrictions; e.g. formal witnesses (the later "sacred sides") may be required to see fair play, or certain cases alone may be settled by a duel. Such duel as a test of honour is often referred to by the authorities before a duel may be fought. There is also doubtless present, even in the most primitive form of duel—or more fight—the conviction, on the part of at least one of the combatants, that he has been wronged, and he feels that the victory will decide which of the two has been right. Though the methods employed are far different, the underlying principle is the same as in the most highly polished modern controversy of any sort whatever. From this feeling that "truth is mighty, and will prevail," comes the conception that the duel has a religious sanction, that Divine powers aid the party in the right, and that it is, indeed, an ordeal, in the technical sense of the term. On the other hand, the increasing scope of law imposes ever narrowing bounds upon the duel, and, as other modes of redress are evolved, the duel becomes more and more needless, especially as it is felt that it involves a useless waste of valuable lives, besides interfering with the majesty of the law. Thus the duel finally degenerates into an act of murder, and can be treated as a crime, even a challenge, except in time of war, being punished with death among the Aztecs. Yet the duel dies hard, for there lingers a persistent belief among many of fine fibre that there are wrongs for which no court of law can give redress, and it must be confessed that pecuniary damages or even imprisonment of an opponent is thin salve for wounded honour. Church and State have alike condemned the duel, and justly; yet perhaps the duellist's side of the argument should not, in fairness, be utterly ignored.

The peculiar nature of the duel from the point of view of early jurisprudence is well illustrated by its relation to the blood-feud (q.v.), to which a man killing another in a duel is rarely liable, this being probable due to the fact that both parties were held to be fighting in self-defence, while in the case of murder there was a recognized form of procedure, there would be no room for blood-feud.

The extreme degeneration of the duel is almost ludicrously illustrated by the "nith-songs" of the Greenslanders. *When a Greenslander considers himself injured in any way by another person, he composes him a satirical song, which he repeats with the help of his friends. If this challenges the offending one to a duel of song, one asks another the two disputants sing at each other their wisdom, wit, and satire, supported by their partisans, until at last one is his wife's duel, when the audience, who are also the jury, make known their decision. The matter is now settled for good, and the contestants must be friends again and not reflect the matter, which was in disgrace to the three books of American Indians, ii. 17 (Volt. 50, New York, 1883)."

Lastly, it may be noted that any attempt to trace the duel from a single people is as useless as it had its origin in the fighting spirit of the human race, and that spirit is as universal as mankind.

LOUIS H. GRAY.

DUNKARDS.—See Sects (Christian).

DUNS SCOTUS.—See Scholasticism.

DURGA.—Durga is one of the commonest names of Siva's spouse. Other names are Devi, Uma, Gauri, Pârvati, Chandî, Chânamûdu, Kâli, Kapâlîni, Bhûvâni, Vijâyâ, etc. (For a very full list, see Dowson, Classical Dict. of Hindu Mythol., London, 1905, &c., Devi). The name Durga originally designated the force, the protection, or the strength, and, therefore, natural that she should present various different aspects.

The worship of such goddesses as ultimately were consolidated in, and made up, the great godhead, the great soul of the universe, have become more popular about the end of the Vedic period, for some of their worship now redrewn, especially in the latest works belonging to it. Ambika is called Kâlida's sister in the Vâjasaneyi Sandhitih, but in Vâtburja daggikâ, x. 15, she has already become known as a dual by themselves, as in later times. In the same work, x. 1 (p. 738 of the Bibl. Indica ed., Calcutta, 1866-70), we find an invocation of Durga devi, who is there styled Kalirohanî, daughter of the Sun or Fire; and in x. 1, 7, among verses addressed to Agni, we meet with two other names of Durga (as in the Vedic period), viz Kâtyâyanî (the text has the masculine form, Kâtyâyan) and Kadçûkumâri. Uma, daughter of Himavat, is mentioned in the Kena Upanisad, III., 28, as a heavenly woman conversant with Brahman, on which account the commentator regards her as a personification of Brahmasvâdyâ; but in Tâtr. Ar. x. 15 (according to the Brāhma text) Kâlida is invoked as Umâpâti, husband of Uma. Kâli and Kârtlî, two names of Durga, occur in the Mâyûkâ Upanisad, i. 2, 4, among the names of the seven tongues of Agni. Finally, it may be mentioned that, in Weber's opinion, there is some connection between Durga and Sarasvati, since the epigraph Varadî, Mahâdevî, and Sândhyâsvara, given to Sarasvati in Tâtr. Ar. xi. 28, resemble, at a later period, exclusively to the consort of Câf (cf. Muir, Orig. Skr. Texts, 1858-75, v. 4251).

From the testimonies adduced, it seems certain that about the end of the Vedic period several goddesses had come to be acknowledged who then or later were promoted to the rank of wives of Hûdra-Siva; and of these it is more or less probable, be connected with mountains and with the element of fire. They have all been blended in the one consort of Siva, whose character obviously betrays the diversity of her origin. In her terrible aspect she seems to represent fire as the devouring and, at the same time, expiating element; and in her more benign character we seem to catch sight of a goddess of the mountains. But there were probably other goddesses or female demons, belonging to different parts of India and worshipped by different classes of people, who in the course of time were combined into one great goddess, the spouse of Siva. This coalescence of various elements in the one great goddess does not seem ever to have been complete, since a kind of consciousness of their disparity appears to have lingered in the mind of her worshippers. In the Nârâyana Purâna (a later text) the Devimâhâyâs (assigned by Pargiter to the 6th or perhaps 5th cent. A.D.). In the story of her victory over Sumbha and Nisumbha, related below, Chandâla (here identified with Chandmûdu) as well as Kâli is said to be an emanation from Durga; through them, and not in her own person, Durga is worshipped (from Kumârâ, Cape Comorin, the southernmost point of India, is supposed to have got its name, which we find already in the Periplo Maria Erythraei (Kumârâ, cap. 65).
DURGA

person, she performed those deeds for which she is hereon eulogized.

This syncretistic process, begun in the Vedic period, is all but complete in the Epics, which, however, do not contain explicit accounts of Durga’s deeds. The divinity of Siva is acknowledged, and the ideas concerning her were very much the same as, though less extravagant than, in later times. What they were will best be seen from a hymn of Arjuna to his charioteer, vi, 52, which is here transcribed (tr. Muir, iv, 429):

1. Reversion to thee, Siddhasena [general of the Siddhas; the noble, the dweller on Mandana, Kumârâ, Kâpî, Kâpîlâ, Kaurâ, the recessive, reverence to thee, Mahakâli; reverence to thee, Chandika; reverence to thee, Ò Târîk (delivered), O Varasvanî (beautiful coloured), O fortunate Kâtikâyani, O Kârâ, O Vijaya (victory), who beholds a peacock’s tail for thy banner, adorned with various jewels, armed with many spears, wielding sword and shield, younger sister of the chief of cowherds [Krâsa], eldest born in the family of the cowherd Nanda, delighting always in Mahesâ’s blood, Kauâkiri, wearing yellow garments, loud-laughing, wolf-mouthed; reverence to thee, thou delighter in Satîle, O Umba, Śundarâ, the dweller on Vindhyâ, she whose chief was black one (or Umbî), O destroyer of Kachchhâ. Reversion to thee, O Himâyâ, Virgâ, Dhimûnâ [gold-eyes; distressed, dark-eyed], O Vedaprâtì [tradition of the Veda] most pure, devout, Jâta-varana [female Agni], who dwells continuously near to Jânu, mystical-precious, and sages of the sphereless, thou art

2. The science of Brahman [or of the Veda], the great sleep of embodied beings, O Indra, O creator, O dweller in wildnesses. Thou art called Sêvâ, Sêvâdha, Kalâ, Kûhlâ [minute divisions of time], Sarasvâtî, Sêvî, mother of the Vedas, and the Vedanta [the end of the Vedas, the search], great goddevi, art praised with a pure heart. By thy favour let me be born in battle. In thy victory let me obtain fame, fear, and difficulties, and in the preservation of thy devout servants, and, in Pâtha, thou constantly abidest, and conquerest the Dakshas in battle. Thou art the maternal daughter of Bhairava, Mahakântha [destroyer], Mahishâ, Śyâ, Hirî, the luminous, Sêvî, the mother, Tuseî [constant-shoe], Kûhâ [perhaps, the low], Sêvâ, Kûhlâ [right], increscence of the sun and moon, the power of the powerful in battle, (all this) art seen by the Nîdhas and Câdnapa [to be]. The letter C of the word Chândikâ [mother] in the second syllable of her epithet is another hymn addressed by Udrishtarî to Durga, very similar to the preceding. Among other things, she is said to have ‘her perpetual abode on the Vindhya mountains, and to delight in spirituous liquor, flesh, and sacrificial victims.’ In the sequel, Muir quotes a remarkable line from the Harivamâs (v. 274), according to which Durga was worshipped by the savage tribal races, Barbâras, and Poulindas.

We now proceed to relate the chief mythological data and the deeds of Durga which are found in Sanskrit literature. Usually she is stated to be the daughter of Himayat (Umâ) Himayavati already in churning the ocean. The latter, according to Râmâyâna, i. xix. 14, the daughter of Meru, and, according to the Purânas,2 the mental daughter of the Manes. According to Râmâyâna, i. xixv. 15, Umâ was the younger sister of Gaṅgâ, and called thyroid of a human [or a cow] three sexes, (where she is called Aparâj, she was the eldest daughter of Himayat, and had two sisters, Ekaparnâ and Ekapâlî, wives of Jâta-vrata and Asita Deva respectively. Sometimes, however, Durga is addressed as sister of Vîsû3 and of Indra,4 whence she is said to be called Kauâkiri. Her epithet Vairôchana, in Tattî, Ar. x. 1. 7, seems to make her a daughter of the Sun or perhaps of Fire, while the epithet, t. Gauâ, one of the three with one of the seven Rishis. Some of these statements were perhaps prompted by a desire on the part of the worshippers of Siva to provide his supreme and pristine abode in the world of gods with a consort of more equal rank than belonged to a daughter of the Himâyâla. Such a tendency almost certainly gave rise to the Pañcarâma story that Siva’s wife originally was Satî, daughter of King Dakshâ, the creator, and that in her wrath she abandoned her bodily existence through yagna, when Daksha slighted her husband by not

1. The form in the original is śiddhasenâ, not śiddhasenâ; “godliness;” the interjection is given by Muir following Nâlakânyô. The name might be explained as ‘wife of Śiddhasena;’ Śiddhasena, however, is a name of Kumâra, not Siva.
2. Kumara-stûyas, i. 18, 19.
3. Harivamâs, i. 1028.

inviting him to his sacrifice. For this accident is not yet alluded to in the earliest account of Daksha’s sacrifice in Mahâbhârata, xii. 284, where Siva’s wife is called Devi and Umâ.

The story of Umâ’s marriage with Siva forms the subject of Kathârâma, a Kusuma-samhâra.2 The gods, defeated by the Asura Târaka, consulted Brahmâ; he predicted that Siva’s son by Umâ, who was not yet betrothed to him, would vanquish their enemy. In order to cause Siva, who was practically an ascetic, to come down to the Himalaya, to fall in love with Umâ, Indra dispatched Manmatha, the god of love, to the spot, where just then the beautiful daughter of the Himâyâla, Siva’s host, was offering flowers to the divine ascetic. Manmatha drew his bow at him, and detached his mind from contemplation. Siva waxed wroth, and reduced the god of love to ashes; but afterwards he was moved by Umâ’s constancy as she submitted to the severest austerities in order to win him, and wooed her. The product of their love was Kumâra, who on his birthday killed the Asura. It may be added that the Purânas tell another tale about this story; when she engaged in austerities, her mother dissuaded her from this course, saying, ‘ô ma, ‘ô no.’

Another son of Durga is Gañeśa, the god with the elephant head. His miraculous birth has been related in art. BRÂHMANISM.4

The most famous deeds of Durga are her victories over various Asuras; they form the subject of the Devâmâyâna, an epic poem of the Mâharâja Parâma, which has become the text-book of her worshippers. In this work Durga is said to have been formed, under the name Chandikâ, by the combined energies of the gods, who put forth in their natural shape, and then the gods of the gods, and had set himself up as the Índra of the heavenly dominions. The goddess did battle with the host of Asuras, and killed them wholesale. Then ensued a single combat between Chandikâ and Mahâsûra, who assumed many forms, especially his buffalo shape, from which he derived his name. At last Chandikâ stood on the demon, and cut off his head; but out of the trunk grew the Asura in his natural shape, and then he was killed by the goddess. It is in this act of dealing the last blow to the Asura who comes out of the beheaded buffaloi that Durga is usually represented in Indian art, not only in drawings, pictures and sculptures, but also in poetry; for the great poet Bâna, who lived in the 7th cent. A.D., describes this scene in nearly every verse of his Chandâsakako, a hymn to that goddess (ed. Durgâ-prakâsa and Parasrî, Bombay, 1889; a new ed. and tr. forthcoming by G. Payn Quackenbos, in the Columbia University Indo-Iranian Series).

Besides the killing of Mahâsûra, the Devâmâyâna celebrates the victory of Chandikâ over the Asuras Sumbha and Niśumbha. These two demons had routed the gods, and had usurped the government of the three worlds. The gods implored the aid of Parâma, who came to him in the water of the Gâṅgâ; from her body issued another goddess who is called Ambikâ or Chandikî. Now, it happened that Chandâ and Mûnda, two servants of Sumbha and Niśumbha, had seen this goddess, and had been struck by her beauty; therefore, advised Sumbha to take her as his wife, who

2. The same story is also told in the Sîva Purâṇa and the Sîva-râhsya of the Skanda Purâṇa. For references, see ZDMG xxvii. (1875), 284.
3. See Kârâkottâ, ii. 907.
4. It may also be added here that Gañeśa is first mentioned in Tattî, Ar. x. 1899, where a manuscript is referred to him under the name Dantî. Cf. also GANAPATI.
upon which the latter sent a messenger to invite her to marry him. She consented, on condition that he should vanquish her. Thereupon Sumbha sent Dhūmrālochana with a host of Asuras to seize her; but she destroyed them all. Then Chanda sent his daughter, who was another arm of Raktabija. When Ambikā saw them, she waxed exceedingly wroth, so that from her forehead issued a terrible goddess Kālī, of emancipated body, clad in a tiger’s skin, with a garland of skulls hanging from her neck, and with a long beehive lolling from her wide mouth. After a frightful battle, she killed both Chanda and Mundha, from whom she received the name Čhāṃma.5 Now Sumbha himself, at the request of the Asuras, went to meet Ambikā, on whose side fought the energies of all gods, which had taken bodily form. Among the Asuras was Raktabhadra; when a drop of his blood fell on the ground, it was at once changed into an Asura of his form. Thus innumerable Asuras soon came into existence, and increased the army of the enemies of the gods. Chandikā then ordered Čhāṃma to drink up the blood of Beh, and fell upon her; and at last killed the exhausted and bloodless Asura. Now Niṣumbha attacked the goddess, while her lion caused great havoc in the army of the demons. The latter, however, bravely met Niṣumbha, but at last was slain. Niṣumbha also was killed by Chandikā.

There is yet another form of Durgā as Yoganidrā or Niḍrā Kālārūpini, which connects her worship with that of Vijñā-Kṣaṇa, and is apparently intended to bring it under the protection and patronage of Viṣṇu.2 In the Harivaṁśa, 2590 ff., it is related by Valākampāyana that, with the view of defending the designs of Kānsa in regard to the destruction of Deva’s offspring, Viṣṇu descended into Pāṭala, where he sought the aid of Niḍrā Kālārūpini (Sleep in the form of Time). And promised her in return that through his favour she should be a goddess adored in all the world. He directed her on this occasion to assume the shape of Čhāṃma on the same night on which he was to be born as the eighth child of Deva; when he would be carried to Yālodha, and she to Devaki. He told her that she should be taken by the foot, and cast upon a rock, but would then obtain an eternal place in the sky, becoming assimilated to himself in glory; would be installed by Indra among the gods, received by him as his sister under the name of Kaśikā, and would obtain from him (Indra) a perpetual abode on the Vindhyā mountains where, thinking upon him (Viṣṇu), she would kill the two demons, Sumbha and Niṣumbha, and would be worshipped with animals worshiped.3

The same story is told in several Purāṇas, e.g. in the Vijaya Purāṇa, v. 1 (tr. Wilson, iv. 260 ff.).

In another myth the goddess is made to share the glory of Viṣṇu.4 When this god, at the end of the nine years during which the sleep of the contemplation on the universal ocean, the two demons, Madhu and Kaṭaḥba, approached him, with the intention of killing Brahmā, who stood on the lotus that grew out of the navel of Viṣṇu; but the latter cut them asunder with his discus. The part played by Yoganidrā in this transaction was this: that she left Viṣṇu’s eyes on being invoked by Brahmā; thus the god was awakened, and could slay the demons. In the hymn quoted above from the Mahābhārata she is styled ‘destroyer of Kaṭaḥba,’ which seems to attribute the victory entirely to her.

From the quotations given above, it is evident that in the period of the Epics, probably towards the end, the worship of Durgā was already firmly established; and that it was further developed in the time of the Hariśvaṁsa and the Purāṇas. But it is in another branch of later Sanskrit literature, that Durgā worship is at its height. The Tantra, says Wilson,

"always assume the form of a dialogue between Śiva and his bride, in one of her many forms, but mostly as Umā and Parāvati, in which the goddess questions the god as to the mode of performing various ceremonies, and the prayers and incantations to be used in them.

They furnish the rites and formulae in a new form of worship, which has largely superseded the older one based on the Veda.

There was yet another custom at work to give the worship of Durgā a new form. In its present form the theory of sakti. Sakti is the energy of a god, especially of Viṣṇu and Śiva; i.e., it is personified as his female partner, and is identified with the prakṛti of Śākti philosophy, whereby a mystical and speculative foundation is given to the sakti-theory, which is already taught in several Purāṇas. By far the most popular sakti is that of Śiva as Parvati, Bhūvālī, or Durgā; and the majority of the Śaktas, followers of these doctrines, worship this goddess.

We have seen above that already, in the Mahābhārata, Durgā is said to delight in spiritual music and singing. It has always been characteristic of the worship of Durgā.

1 In Bengal, says Colebrooke, 1 and the contiguous provinces, thousands of kids and buffalo calves are sacrificed before the idol, at every celebrated temple; and eminent persons make a similar destruction of animals at their private chapels. The sect which has adopted this system is prevalent in Bengal, and in many other provinces of India. 2 But the practice is not approved by other sects of Hindus.

Even human sacrifices were offered to the godess in some places. Bāṇa (7th cent.), in a lengthy description of a temple of Chandikā, 2 alludes to human sacrifices; Bhāvabhūti (8th cent.) introduces, in the 5th act of his play, Mālātikā and Maṅdhāti, a temple of Śākumā and her votaries, who try to sacrifice a human victim; in the Samārāchāra Kāli, by Haribhadra (9th cent.), a temple of Chandikā and the goddess of a human sacrifice by Sabaras are described (p. 435 ff., Bibl. Ind. ed.); in the Kalī Kārūṇā, ‘minute directions are given for the offering of a human victim to Kāi, whom it is said his blood satisfies for a thousand years.

Finally, mention must be made of the most degraded worship of Durgā and other saktīs by the Vānis, or ‘left hand’ worshippers; in it debauchery and gross immorality are admitted, so that the worship is perverted into a most scandalous orgy.

LITERATURE.—This has been sufficiently indicated in the article.

HERMANN JACOB.

DUTY.—If taken in a wide sense, the notion of duty is essentially implied in every system of morality and every ethical theory. For all morality and all ethics is, in the final analysis, the recognition of the inclinations of the individual and some objective and authoritative standard to which these inclinations must be subordinated; and it is just this objective control that is emphasized in the notion of duty. Duty comes to us with a claim; it is a thing laid upon us to do whether we like it or not. But, although the element of objective authority is necessarily implied in every moral standard, the notion of duty is far less prominent and exclusive in some systems of morality than in others; and, of course, is also far less distinctly abstracted and analyzed, and occupies a far less fundamental place, in some types of ethical theory than in others.

1 In Greek ethics, for instance, the moral life is, for the most part, presented as a good to be realized or a type of virtue or excellence to be attained. More good or true happiness, the health of the soul, is shown to lie in the life of virtue, the performance of the work or function which his own nature and the part he has to play in the general life of the community mark out for him. To see

DUTY

in this life of virtue his real happiness or good is man's true wisdom, whereas the scepticism which sees in it only a burden and a restraint imposed for the advantage of others is short-sighted folly. The restraints of the virtuous life are only the restraints which prevent a man from being any more himself and would live a truly human life among his fellows. So long as this mode of presenting the moral life prevailed, the element of duty was completely left out, and was subordinated to, the horizons of good or achievement. A man must be courageous, temperate, and just, because in no other way can he achieve his good or true happiness.

It was only when, in Stoicism, this good was conceived to be determined by, and to be realized in obeying, a cosmical law of universal reason that the notion of duty emerged into a new distinctness and prominence. Not that the Stoics could not, or did not, use the same general formulae as the other schools had done. The change, apart from details, is rather one in the whole philosophical atmosphere. The same formulae might be used, but they were used in a new sense. Everything was now coloured by the pantheistic necessity of the Stoic system. The life which it beheld the good or wise man to lead was one determined for him by the laws of the world, which prescribes to man his place in the system of things and the duties pertaining to that place. It was for man to recognize the place and duties assigned to him, and thus consciously to live in accordance with nature, or the immanent reason of the universe. Hence the notion of duty entered into the Stoic system in a double sense, expressed by the two terms καθοδος καὶ καθοδομία. The former term was applied to right action, simple fitting or prescribed by nature, the latter to the same actions when consciously done for this reason by the good or wise man; hence only an action which deserved the latter epithet was completely good or virtuous.

2. Thus it was when morality came to be regarded mainly in the light of conformity to a law that the notion of duty became prominent. The Stoic law of nature, however, was also a law of reason, which the same reason in man enabled him to recognize. And this conception of the law of nature, as the law which reason affirms, continued even after the law of nature had come to be, in many cases, identified with the shape of the jus gentium, or equity of Roman jurisprudence. Now, Christianity, like Stoicism, represented morality in the light of obedience to a law, but the Christian law was the revealed commandments of God—not a law which man's reason had to discover, but one which was given to man by Divine revelation, and had simply to be obeyed. Hence the strictly authoritative aspect of duty stands out much more prominently in Christian than in Stoic morality. Of course, it did not follow that, because the Moral Law was thus authoritative, it was in any sense arbitrary; this mistake is often made of later religions. The natural assumption was that, being God's law, it could not but be a wise and good law. But the law was to be obeyed by man because it was laid upon him by God, not because man himself saw his good or true happiness to consist in obedience to such a law. Man's eternal welfare—his entrance into the Kingdom of God, as the primitive Christians would have said—was bound up with his obedience to God's law, but so bound by God's own ordinance, not by any sort of connexion which man's own reason discovered to him.

Now, this kind of separation between duty and good, this reference of the connexion between them to a hidden Divine source, remains characteristic of the Christian morality and ethics throughout, whereas it was quite absent from Stoicism. This would be master of himself and would live a truly human life among his fellows. So long as this mode of presenting the moral life prevailed, the element of duty was completely left out, and was subordinated to, the horizons of good or achievement. A man must be courageous, temperate, and just, because in no other way can he achieve his good or true happiness. In this sense, then, the performance of duty remains, on the Christian view, always a matter of obedience rather than of insight; the good of obedience is not our concern. On the other hand, as regards the actual contents of the law which is to be obeyed and the mere rightness of obeying it, the tendency of the more philosophical expositions of Christian ethics has usually been to assert that man's own reason or conscience not merely assents to, but itself also affirms, the fundamental precepts of revealed morality. That is to say, God has not only revealed the Moral Law by express communication, but has also implanted it in man's conscience, or made him capable of discovering it by the due use of his natural reason. Revelation only reinforces or amplifies the dictates of conscience or the natural law. Thus, on this view, therefore, the main object of duty is by no means a matter of merely external command; it is no less a matter of internal perception and recognition.

We see the rules of duty to be in themselves right, or such as we ought to obey (Intuitionism) without needing to know wherein the good of obedience consists; conscience has an intrinsic authority which makes itself immediately felt. The coarser expositions of Christian ethics, on the other hand, have tended to present the rules of duty, even when it was acknowledged that they may be known by the light of nature, as depending for their authority on rewards and punishments (e.g. Paley). The same tendency in secular ethics leads to the representation of morality as good policy, and seeks to back up the claims of duty by an appeal to the enlightened self-interest, or at best, to the finer sensibilities, of the individual. The prevalence of this type of ethics in the 18th cent. partly accounts, by way of reaction, for the severity of the classical exposition of the conception of duty which we owe to Kant.

2. Kant—In distinction, with which Kant's exposition opens, between action done from duty and action done from inclination is one which, no doubt, lends itself to such caricatures as that drawn in Schiller's well-known lines, but it was really necessary for Kant's purpose. This was—to make absolutely clear the objectivity of duty. What is right is right whether we like it or not, and, were it not that the right thus stands out as something objective and authoritative over against our private inclinations, the notion of duty would have no meaning. Morality does not begin to exist until this contrast is felt and takes effect. As Kant puts it, 'Interpretation is a game unless it is done from duty, i.e. in the consciousness of its rightness. Paradoxical as this proposition has often been found—for good actions surely are often done without any thought of duty—it is, from the point of view of Kant's system, a truism. An action that expresses nothing but the present inclination of the agent tells us nothing about his character. What he does from inclination to-day, he may likewise from inclination refuse to do to-morrow. The commands of duty do not wait upon

1 Ro, &c. Butler, *Analogy,* p. 114. The conception of a law written in the heart and conscience is very similar to that of St. Paul (Ro 8:21), who may owe it indirectly to the diffused influence of Stoical ideas.
our inclinations, or strike a bargain with us; the imperative of duty, in Kant's terminology, is a Categorical Imperative.

Some other features of Kant's ethical doctrine which are closely connected with his analysis of the notion of duty may be noted. (1) He regards the Categorical Imperative as a formal, universal, and a priori proposition, to be disinterestedly obeyed as a moral law, and as such to be a law which prescribes the spirit in which actions are to be done rather than the objects at which they are to be aimed at. (2) He lays great stress upon what he calls the 'autonomy of the will,' i.e. the necessity that we should be able to see in the command of morality, not a foreign compulsion upon us, but the expression of our own highest spiritual nature which is our true freedom. (3) He regards the conception of the Moral Law as the first and fundamental conception of ethical theory, and that of the good as subsequent to and dependent upon it; in fact, the good is for him, one might say, a religions rather than a strictly ethical conception. From all this it is evident that Kant was not far wrong in supposing himself entitled to look upon his ethical theory as a philosophical version of the Christian morality. (4) He lays great stress upon the 'self,' i.e. the necessity that we should be able to see in the command of morality, not a foreign compulsion upon us, but the expression of our own highest spiritual nature which is our true freedom. (5) He lays great stress upon the 'self,' i.e. the necessity that we should be able to see in the command of morality, not a foreign compulsion upon us, but the expression of our own highest spiritual nature which is our true freedom.
would even have regarded remorse for such a shrinking as fantastic and overstressed.

6. When the various duties are regarded in an objective way, it is natural to seek for some kind of classification of them in order to make a system of duties. But, unless we are quite sure what we are about in using it, it may easily involve in somewhat gross confusion and error. Both terms used in the division are treacherous. The term 'self-regarding duties' is apt to be taken in the sense of duties to oneself, and this was, in fact, one of the heads under which duties were ranged in the threefold scheme favoured by the older moralists, viz. duties to oneself, to one's neighbours, and to God. But it is evident that, in any sense in which we can owe it to ourselves to perform some of our duties, we owe it to ourselves to perform them all; while, in the more literal sense, in which a debt or obligation is owed from A to B, it is presumption on our part to suppose that he can properly be said to owe any one of our duties to ourselves. The term 'social duties,' again, is apt to suggest that there are other duties which are non-socially alone the conduct and we may even be led to infer, with J. S. Mill, that 'the only part of the conduct of any one for which he is amenable to society is that which concerns others, while in the part which merely concerns himself, his independence is, of right, absolute.' (Liberty, People's ed. 1865, p. 65.) But such a view is really contrary to the actual tenor of our moral judgments, which condemn, and assert a right to correct social harm which is much more than 'contiguity' or 'constructive.' And, finally, any supposed right to an absolute independence, however limited, on the part of the individual is contradicted by the very meaning of a right, which, of course, implies social recognition and respect for the claims of others, which are due to misunderstandings to which the division into self-regarding and other-regarding duties is exposed, it does point to a palpable enough distinction between the objects or spheres of the respective duties. We can practise the duty of temperance by ourselves; the duty of truth-speaking can be practised only in relation to others. This distinction—between what we might call immanent and transient duties—in clearly valid enough; but it is not a distinction in the source or basis of the obligation. The performance of both duties alike is owed (metaphorically) to ourselves and (literally) to the moral community of which we are members. The duties which are practised in relation to others may be subdivided into those which are of a more general kind, such as veracity or promise-keeping or honesty, and those which depend upon some more specific relationship or institution, such as parental or filial duty, which depends on relationship within the family. (The distinction between duties of strict or perfect, and duties of imperfect, obligation can hardly be regarded as a distinction of principle, except in so far as it is identified with the distinction of legal obligation and moral duty.)

7. When they are thus classified from the objective point of view, we can hardly deny the possibility of a real conflict between duties. The individual, of course, can do only one thing at a time, and, in face of warring claims, has for his one duty to make the best he can of the situation before him. What this best will be must clearly depend on the particular nature of the situation in question, and it is difficult to think of any satisfactory scheme of division. Perhaps the most common and obvious division is that between self-regarding and social duties. But, unless we are very sure what we are about in using it, it may easily involve us in somewhat gross confusion and error. Both terms used in the division are treacherous. The term 'self-regarding duties' is apt to be taken in the sense of duties to oneself, and this was, in fact, one of the heads under which duties were ranged in the threefold scheme favoured by the older moralists, viz. duties to oneself, to one's neighbours, and to God. But it is evident that, in any sense in which we can owe it to ourselves to perform some of our duties, we owe it to ourselves to perform them all; while, in the more literal sense, in which a debt or obligation is owed from A to B, it is presumption on our part to suppose that he can properly be said to owe any one of our duties to ourselves. The term 'social duties,' again, is apt to suggest that there are other duties which are non-socially alone the conduct and we may even be led to infer, with J. S. Mill, that 'the only part of the conduct of any one for which he is amenable to society is that which concerns others, while in the part which merely concerns himself, his independence is, of right, absolute.' (Liberty, People's ed. 1865, p. 65.) But such a view is really contrary to the actual tenor of our moral judgments, which condemn, and assert a right to correct social harm which is much more than 'contiguity' or 'constructive.' And, finally, any supposed right to an absolute independence, however limited, on the part of the individual is contradicted by the very meaning of a right, which, of course, implies social recognition and respect for the claims of others, which are due to misunderstandings to which the division into self-regarding and other-regarding duties is exposed, it does point to a palpable enough distinction between the objects or spheres of the respective duties. We can practise the duty of temperance by ourselves; the duty of truth-speaking can be practised only in relation to others. This distinction—between what we might call immanent and transient duties—in clearly valid enough; but it is not a distinction in the source or basis of the obligation. The performance of both duties alike is owed (metaphorically) to ourselves and (literally) to the moral community of which we are members. The duties which are practised in relation to others may be subdivided into those which are of a more general kind, such as veracity or promise-keeping or honesty, and those which depend upon some more specific relationship or institution, such as parental or filial duty, which depends on relationship within the family. (The distinction between duties of strict or perfect, and duties of imperfect, obligation can hardly be regarded as a distinction of principle, except in so far as it is identified with the distinction of legal obligation and moral duty.)

Henry Barkei.

Dwarfs and Pygmies.—These terms are nowadays interchangeable in the dictionary of ethnology, and are indifferently applied to those undersized races which exist, or have existed, in various parts of the world. In addition to tribes or nations of dwarfs, there are also small-statured individuals, occurring sporadically among the taller races, who may fairly be styled dwarfs. Their low stature is often attributable, however, to morbid physical conditions in the individual, and not in the case of healthy persons, as an inheritance from a line of ancestors of dwarfish type. The present inquiry is limited to those who are inadulterate dwarfs by race.

In the Tontenian languages, the word 'dwarf' can be traced back for at least twelve centuries, appearing under such forms as O.N. dyrgr, Anglosax. deovor, O.H.G. dewer, Germ. Zwerg. It occurs also in Gaelic as drochd and trosh, but these are probably borrowed from Tontojo sources. The other Osicic synonyms, e.g. O.Ir. leacs, have quite a different etymology, as also have the Cymric terms, e.g. Welsh pygor. The word 'pygmy' is recognized at much earlier dates, being derived from Gr. pygmē, a measure of length from the elbow to the knuckle or fist (pygmē) =11 inches. Similar in connotation is the Gr. prwor, proros, represented by O.Ir. prōr, O.H.G. prūo, 'shrunken,' and also by the Teutonic words for 'finger'; and a like idea may be present in Lat. pupillus (cf. O.Ir. pūl, 'a little,' puppy) and in Gr. puaps (cf. O.Ir. pūs, 'a cub'). The Balto-Slavic group, represented by Russ. kariu, Lith. króliu, is doubtless borrowed from O.H.G. karaus, 'a dwarf,' and also by the German word for 'crossbread,' Schradler, Streller, der niedriger. Altertumskunde, Brunsbü, 1803, pp. 100-100. The fact that the term 'pygmy' was originally held to denote a people of the preposterously small stature of 133 inches renders that term not so acceptable as 'dwarf' in any serious discussion.

The present art, deals with the subject mainly from the anthropological angle; fuller treatises on dwarfs in folklore will be found in the 'Tontenio' and 'Slavic' sections of art. DEMONOS AND DURATS, and in the art. FAIRY.
DWARFS AND PYGMIES

It is to be noted, however, that 'pygmy' has now lost its first meaning, and merely denotes the mere diminution in stature of the ordinary races of man. Windle, who has made a careful study of the facts relating to these people, allows a somewhat high level as the upward limit, laying down the definition that 'any race in which the average stature does not exceed 4 feet 9 inches may fairly be described as pygmy' (Introduct. to Tyson's Pygmies, reprint of 1894, London). This is the height of the West African Obongob of the Gafo, described by P. du Chaillu, and quite recently by Prount (D'Anthropologie, 1910, pp. 435-504), who places the average stature of the men at 4 ft. 8 in. (1.43 m.), and of the women at 4 ft. 6 in. (1.37 m.). This indicates a much taller race than the Akkas encountered by Sir H. M. Stanley, who estimated their adult height at from 3 ft. to 4 ft. 6 in. (In Darker Africa, London, 1899, ii. 92). A. B. Lloyd (In Dwarf Land, London, 1899, pp. 310, 225) gives a similar report of those whom he met. Even lower is the stature of a race, presumably Eskimo, inhabiting the north-western shores of Hudson's Bay in the 17th century, for Captain Pery records (1670) that he found there a native race of people in that region in which the longest corpse did not exceed 4 feet.1 Windle (op. cit. p. xxxiii) cites the case of a Bushman woman, the mother of several children, who was measured 3 ft. 8 in., while another woman of her race measured 3 ft. 3 inches.

The distribution of dwarf races seems to have been at one time world-wide; but at the present day they are found chiefly in the equatorial regions of Africa and Malaysia. Classic writers, such as Pliny, Pomponius Mela, Aristotle, Ctesias, Herodotus, and Homer, make several references to African pygmies, and they also figure prominently in the records of Ancient Egypt. The most important of the tombs at Assuan explored by E. A. W. Budge is that of a provincial governor, Her-Kehef, who lived in the reign of Pepi, in the VIth dynasty (c. 3500 B.C.), and who was sent on an expedition to the Sudan to bring back a dwarf for the king. Brugsch (Hymenemath, Leipzig, 1891, p. 141) cites an inscription at Karnak, belonging to the Ptolemaic epoch,—the three centuries before Christ,—which states that 'the dwarfs of the southern countries came to him [the reigning Ptolemy], bringing their tributes to his treasury.' Ed. Naville, in his account of the festival-hall of Osorkon II. in the great temple of Denderah, in his journal (London, 1862, p. 305), refers to a picture which seems to show that racial dwarfs were specially selected as the vergers of the temple. A very interesting and suggestive comparison between the pygmies of the classic writers and existing dwarf races has been made by Paul Monceaux in his treatise on 'La Légende des pygmées et les nains de l'Afrique équatoriale' (Revue Historique, xlvii. [1891] i-64), the inference drawn being that the pygmies of the Greek and Roman writers, sculptors, and painters are memories of actual dwarfs seen by their forefathers in Africa and India. He further points to the resemblance between the modern Akkas of Africa and the dwarfs portrayed at Pompée, Rhodos, and Cyprus, and to the 'Patakas' placed as figure-heads on Phoenician ships. The supposition that the Jews as well as the Egyptians were acquainted with material dwarfs is strongly supported by the term Gammadim which occurs in Ezk 27:1. In the Vulgate this term is rendered by Pygmies, in

1 Leblanc (Histoire des savantes anciennes, 120th ed., Paris, 1774, i. 130) speaks of a girl, captured on the Lannudor coast in 1717, declared that in her country there were entire tribes of men three feet high, the slaves of those of taller stature. On American Indians of low stature (100-160 cm.), see Siriricka, in Bull, 20 PE, i. 50; and on popular tallacises concerning Indian pygmies, Holmes, 8th ed., 282.

2 Unus (Histoire des savants anciens, 120th ed., Paris, 1774, i. 130) speaks of a girl, captured on the Lannudor coast in 1717, declared that in her country there were entire tribes of men three feet high, the slaves of those of taller stature. On American Indians of low stature (100-160 cm.), see Siriricka, in Bull, 20 RE, i. 50; and on popular tallacises concerning Indian pygmies, Holmes, 8th ed., 282.
under 3 ft. in height, dark-skinned, pot-bellied, and powerfully built, with large arms and legs—this last statement being scarcely consistent with dwarfish stature. They were expert trackers, very nimble and deft. It is stated that two of them once still exist on the banks of a certain river to the south-west.

The existence of a pygmy race in New Guinea has been known for a considerable time. The Indians interviewed by a British expedition sent out by the late Mr. Joseph Balfour, and they have been seen by d'Albertis, Lawes, Cayley Webster, and other travellers. But much interest was aroused in the summer of 1910 by the information sent home by a British expedition with regard to a tribe of dwarfs whom they found inhabiting the Charles Lewis Mountains in New Guinea, at an elevation of about 2000 feet above sea-level. Four of the men were temporarily captured by Captain Rawling's party, and on being measured they proved to be respectively 4 ft. 6 in., 4 ft. 4 in., 4 ft. 3 in., and 4 ft. 2 in. in height. They were naked, except for a grass helmet, a bag, and a heavy, roped, round the waist. They were described as good-looking and well-proportioned, and of a lighter complexion than the natives of the lowlands. The general average stature of these Tapiro pygmies is 4 ft. 8 in., while that of their lowland neighbours is 5 ft. 1 in.

In several other parts of Eastern Asia there are, or have been, dwarf races. In ancient Chinese records there is mention of black or brown dwarfs in the provinces of Shantung, Kiang-nan, and Kansu. A hundred years ago, in the same region, there were, no doubt, several thousand such people, but now they are practically extinct. In the south of India, the pygmies were still to be seen, and their existence is referred to in the Mahabharata. The pygmies of Central India, as given by Coeneus, 11 (in Flotius, Itin. xix. 1720), are of doubtful reality, and probably of Indian origin, resembling the same language as the other Indians. They are very diminutive, the tallest of the whole tribe being the major. Their bodies are only one and a half feet long. They have large ears, and their hair grows very long down to their knees, and even longer. They have the largest body to stature that was ever seen, and when they were grown sufficiently long and copious, they never wear clothing, but, instead, they cut off their head or hair-braids for belts and girdles, which, in front, are their trousers down to their very feet. When their hair has thus thickly enveloped their whole body, they bind it round them with a sash, and so make it serve for a garment. Their privies are thick, and so large that they depend even on their ankles. They are, moreover, unshaven, and so indifferent as to ill-favoured. They are eminently just, and have the same laws as the Indians. They hunt hares and foxes, not with dogs, but with racoons and kites and crows and vultures' (Sir John McBride, Ancient India as Described by Kautilya the Kautilya, Calcutta, 1853, p. 114). In this Negrito phenomenon (in Strabo, p. 711, and Pliney, H. N. vii. 2) adds that they also had some connection with the Pygmies, to whom is ascribed the account in H. N. viii. ii. 5, of Pygmies by whom the races with whom the ancient races, mentioned in H. N. viii. ii. 5, were so-called. These accounts have been carefully analysed by Lassen (Jot. Alterthumskunde, ii, Ludovic, 1872, p. 230), who states that the conclusion that these 'pygmies' represent the Kiprata, a race of dwarfs as compared with the Aryan Indians, long-haired (though beardless), flat-nosed (though light in colour), brave and warlike, and expanded to the constant example of the mythical bird Garuda. Moreover, in Sanskrit literature, their national race, is one of the terms for 'dwarf'.—L. H. Grätzel.

The accounts from America are not so definite as from India or Africa, but dwarf types are reported from Argentina, Peru, the Amazon basin, and Central America. In North America, the Arapaho Indians of Oklahoma and of Wyoming have many traditions of a fierce race of dwarfs with white skin and clever and formidable fathers. They are described as a little

1 For these various American Indian traditions, see accounts by S. Colt, in the Century, Jan. 1903, and by A. L. Kroeber, and S. C. Simms, in Publications 85 and 85 of the Field Columbian Museum, Chicago, 1902.
not now be employed to express a protest against a theory that healthy living dwarf races have originated in the degenerated forms of races of normal size. The very adjective 'normal' would be ruled out of court in this connexion. On the other hand, Kollmann's conclusion, that the pygmy races represent the primitive 'normal' stock of mankind, is an idea that should be carefully considered.

It is, of course, too soon for such ideas to have obtained complete recognition, especially among those whose mental bias is innately conservative. In the present number (April 1911) of Petermann's Mitteilungen, R. Andree refers to certain expressions of dissent aroused by Schmidt's new work, Die Stellung der Pygmaenvolker in der Entwicklungsgesch. des Menschen (Stuttgart, 1910), which follows the lines laid down by Kollmann. Among the opponents of the new ideas, Schwabe, Keith, and Czecanowski are specially named by Andree. The leading arguments in Schmidt's book are thus referred to by a reviewer in the Times, Literary Supplement, 16th June 1910:

'Dr. Schmidt's long and careful study of the physique, the language, and the culture of the dwarf races of mankind... is certainly one of the most important of anthropological investigations that have appeared in recent years. Its conclusions are more revolutionary than those of Schlagintweit... it is a new light... Dr. Schmidt's minute investigation of all the pygmy races known when his book was being written, has led him to some extraordinary views.' The view maintained by the well-known anatomist of Bacl, J. Kollmann, who holds the pygmies to be the oldest known race of mankind on the earth—"the child-race of mankind. The child-race, not a half-bestial race. The distinction is shown very clearly when one regards a race as a whole... They are entirely different from the Pygmies... They are not only men, but undeveloped men; Their mind is a human, a thinking mind; they possess human feeling and a distinct racial will. Morally, although, like children, they are prey to many fleeting impulses and wanting in perseverance, they stand upon the road that leads to self-development; they have a religion which stands in close relation to their ethics. They are anything but vicious or malignant. Their intellectual attainments are very low, but they are capable of responding to demands made upon them, and the mental powers they have evolved are adequate for their way of life... In physical indications, there are, of course, many marks of a non-human ancestry, but the upright or projecting forehead and the frequently large and expressive eyes mark a distinction which cannot be overlooked... Spiritually, the pygmies "stand in no way nearer to the beast than any other race of man..." they "do not give as the smallest encouragement to the supposition that in and by them a bridge can be drawn across a gulf between the human and the beast soul..." We may close by expressing our hearty concurrence with Dr. Schmidt in one sentence at least: not only is his work original, but it is methodically and logically carried through from beginning to end. His investigation of the pygmy races is, at the present moment, one of the most important, if not the most weighty and most urgent, of the tasks of ethnological and anthropological science.'

The conclusion arrived at by Kollmann, Schmidt, and the Andrees has been steadily gaining ground during recent years. It is interesting to note, although the circumstances will have no value in the domain of science, that the same belief was held by the early Scandinavians, who asserted that the dwarves were created before men. The late Charles Godfrey Leland, by an intuitive process, had arrived at the same conclusion. 'I believe mankind was originally a dwarf,' he observed many years ago, in a letter to the present writer. But the assertions of tradition, and the intuition of a man of genius, are negligible quantities in scientific controversy.

The opposite contention is that the taller races represent the degenerate forms of races of normal stature. This view finds little support in the statements made by E. Torday in his book, L'Homme des Pygmées (1895). Torday and his party visited a village of pygmies near the confluence of the rivers of the Bu-Shongos. These pygmies, instead of leading the wandering, forest life of their ancestors, are settled agriculturalists, and have been so for the last two or three generations. They have even been found to be extremely fond of the effects of alcohol, and the alteration in environment and habits is that the sedentary pygmies are considerably taller than their kindred who still lead the nomadic life of the forest. There has been suggested that their superior stature, and their increasing aversion to agriculture, are both due to a possible admixture of blood in a previous generation, and that the settled pygmies are not typical pygmies. This must be so, for the theory of a dwarf race must be strictly ascertained before any satisfactory deduction can be made. There is one conclusion, however, that seems inevitable: if these pygmies are of pure, undiluted stock, and have grown in stature by abandoning the forest, then the converse would hold, and the tall Bu Shongo among whom they live would, if driven into the forest by a stronger race, begin to approximate in stature and physique to the forest pygmies, should they be forced to live their life for a similar period of time. The question of environment cannot be overlooked, but it may be doubted whether its potency is so great as to produce such results.

One or two other facts connected with the Bu Shongo and the nomadic pygmies of their region must be noticed here. Each Bu Shongo kinglet has a group of pygmies under his suzerainty, who supply him with game in exchange for food. But, although the Bu Shongo utilize the pygmies in this way, they regard them as beings of a different nature from themselves. They are held in awe as 'half-giants'—spirits born from trees. This attitude is by no means confined to the Bu Shongo; there is a wide-spread dread of the pygmies among other African tribes. When a piggie arrow is found in a banchan of growing bananas, no man, even the owner, would be bold enough to take away either the arrow or the bananas.

These facts lead naturally to the subject of the reverence paid to dwarves in many lands. In passing, it may be observed that this reverence tends to support the idea that mankind generally regarded the dwarf races as in some sense beings of a special order, the gulf between the race of man and the Kimos of Madagascar, a race of long-armed dwarves. They are known also as Vazimbas, and under this name E. B. Tylor refers to them (Prim. Cult., 1891, ii. 114 f.) in the following connexion: 'In Madagascar the worship of the gods is remarkably associated with the Vazimbas, the aborigines of the island, who are said to have been able to get up and down in the interior, and whose peculiar graves testify to their former occupancy of other districts. These graves, small in size and distinguished by a cairn and an upright stone slab or altar, are places in which the Vazimbas regard with equal fear and veneration... To take a stone or pluck a twig from one of these graves, to stumble against one in the dark, would be resented by the angry Vazimbas inflicting disease, or coming in the night to carry off the offender to the region of ghosts.'

In Southern India a similar attitude is observed towards the dwarfish Kurumals of the Nilgiri hills. Popular tradition asserts that the megalithic cromlechs of the district were reared by the ancestors of the Kurumals. 'Though they are regarded with fear and hatred as sorcerers by the agricultural Madigas of the table-land, one of them must, 1

1A similar belief existed among the pagan Llhuamans regarding the kusukus (Llih. kusuku, 'dwarf, elf'), concerning whom Lasiusius (de Dios Samagurum, Basel, 1616, p. 51 [new ed. Mannhardt, Biebrau, 1830]; cf. also Schmidt, Peterman-Gesammelte Abhandlungen, Bonn, 1896, p. 82) writes: 'Sunt lumres quos Resi Vose (= Kusuku, goblinia) appellant: barbarioci, altitudines unae puante existen in regione tam vile, quod non ad imminente his pape... qui luere deus sinu muse... cum suis animis:... hic vir obiens obiit apotomatus, quod nisi fac, ea sunt vinae, quares quisque sosr tonitas, idque deus... (quoted by Schrader, loc.). For further allusions to Balto-Hispanic beliefs on dwarves, reference may be made to Haeusser, Wissenschaff des d. d. Kabbala, ii. 330, although the work must be used with extreme caution.—L. H. Gray.']

DWARFS AND PYGMIES 125
however, at sowing-time be called to guide the first plough for two or three years, and go through a mystic pantomime of prostrating themselves on the earth newly ploughed, which is certainly fall. When the plough is at rest, the Kurumba must pass the night by the dolmen alone." (Windle, p. xxvi).

However, the dolmen is considered as a kind of Levite estate, possessed of a peculiar supernatural power. Possibly the idea of employing dwarfs as temple-keepers in ancient Egypt may be due to a similar belief. In view of the association between dwarfs and supernatural structures in Southern India, it is of interest to record Captain Meadows Taylor's statement (Cairns, etc., in the Deekhan, Dublin, 1865, p. 1) that the chronicles of the Deccan

"were copied in many little, in the Casarlian language, Mores, Moor's, and these Morers were believed to have been a dwarf race of great strength, who inhabited the country in very remote ages.

A very full account of the Kurumbas, with copious references, will be found in Gustav Oppert's Original Inhabitants of India, Madras, 1883, ch. xii.

Mention has already been made of the resemblance, pointed out by Paul Monecaux, between the modern Akkas and the dwarfs portrayed at Pompeii, Rhodes, and Cyprus, as well as the

Patakas of the Phoenicians.

"A certain race of evil dwarfs," he further says (loc. cit.), "are strongly associated with the Phoenicians. The 'dwarfs of Egypt' or of Phoenicia, the huge head, the thick hanging lips, the enormous eyes, the excessively long arms, the excessively short legs, twisted and bowed.

No one will quarrel with any of this; but the significance of the comparison lies in the indication that the dwarf gods of Egypt and Phoenicia had their origin in a veneration paid to living dwarfs of a similar nature to that accorded in Madagascar and Southern India.

The question of dwarf races is manifestly more circumscribed in Europe than it is in countries where there are living specimens to be studied. Observations made in these countries are, as well as many references in tradition, but the field of conjecture is confessedly wide. Many observers of the African pygmy races have been reminded of European traditions which seem to point to a similar race in Europe.

"Other dwarf races of humanity belonging to the white or the Mongoloid species may have inhabited Northern Europe in ancient times, or it is at least universally supposed that the type of Pygmy Negro, which survives to-day in the recesses of Inner Africa, may have overflowed Europe in remote times. If it is true, then the conclusion is irresistible, that it gave rise to most of the myths and beliefs connected with geniuses, kobolds, and faeries.

The noted ancestor of the little dwarfs in the present day is related, over and over again, of the giant atelier, who lives in the recesses, under the earth, and is a benefactor. Their remarkable power of becoming invisible by admiring the roofs in heritage and behind rocks, their probable habits, in sterile or mountainous districts, of living in the old houses of the dead and caverns, their mischievousness and their prankish good-nature, all seem to suggest that it was some race like this which inspired most of the stories of Tento and Cott regarding a dwarfish people of superb supernatural attributes." (Sir H. Johnston, in Pall Mall Mag., Feb. 1905, p. 170).

Of the dwarf skeletons found in Europe, scientific accounts are furnished in the works of Kollmann and Schmidt, already cited. Special mention may also be made of an article on 'Trouisther Pyg-"mien in Schlesien,' by G. Thilenius, which appeared in the Brunswick journal Globes in 1892 (ib. lxxxvi. no. 74).

A recent addition to the list of European dwarf skeletons is that of a young woman, 4 ft. 6 in. in height, which was found in Scotland in 1707, at the bottom of a pit in the Roman fort at Newstead, Roxburghshire. The skeleton is thus referred to be the most ancient excavation of the fort during the period 1905-1910.

"The most curious of all these human relics was the nearly complete skeleton of a dwarf, found in one of the pits. Professor Peryy estimates the age at from twenty to twenty-three years, and yet the height cannot have exceeded four feet six inches. Though the creature must have been a dwarf, the bones show no signs of rickets or other bone disease, being well formed, but the dwarfism points to a remarkable degree. How it came to lie in the pit beneath the bones of nine horses is a problem of which no solution can be hoped for." (A Roman Frontier Fort and its People, Glasgow, 1911, p. 111).

The Tapiro pygmy living in the Amazon forest is described by Mr. Rawling in The Geographical Journal, xxxvii. 3 (London, Sept. 1911), 343-347. An account of pygmy remains found in a cave in Southern India is contributed by Mr. D. B. J. Rawling to the Saturday Review, London, Sept. 30 and Oct. 21, 1911.

DAVID MACRITCHIE.

DWARAKA (Skr. Dwārakā, Dwārakā, the city of many gates)._The famous city and place of pilgrimage associated with the life of Krishna, situated in lat. 22° 14′ 20′′ N., long. 87° 21′ E., in the native State of Okhānmandar in the peninsula of Kathiawār in Western India. It is the form of the legend, Krishna is said to have been assisted by the hosts of Rāja Jarāsandha, whom he repulsed seventeen times. Jarāsandha, finding it vain to continue the struggle alone, called in the aid of Jarā Kālayavana, who with his horse from the far west bore down upon the doomed city of Mathurā (q.v.); and it was at the moment of time transferred the whole of his faithful people. The first intimation that reached them of their changed abode was the sound of the sacred cow and the clanging of the cows' bells, which awoke the next morning. The legend probably represents some attack by forces from the west on the people of the Jamnā valley, and their retreat before their enemies southwards in the direction of the sea. Krishna, it is said, reigned in splendour in his new city, and there, by his wife, Jāmbavati, daughter of the king of the bears, he had a son named Samba. The latter, by an inexcusable prank, insulted the Pā, or ascetics, who cursed him and his family. To remove the curse they went on a pilgrimage to Somnāth (q.v.), and there Krishna was accidentally slain by the arrow of a Bhul hunter. Hearing of his death, the great Milk maidens, the companions of his ruler, buried themselves at a place called the Gopī Talāv, or "milkmaids' tank." Their ashes, it is believed, turned into the white clay still found at the place, which is called Cappikand, or the ritual well. The clay is used and needed by members of the Vaiṣṇava sect to make their forehead marks. J. Kennedy (J.R.A.S., October 1907, p. 951 ff.) distinguishes the most ancient Krishna of Dwārakā from the Mathurā deity.

Two places are specially venerated in connexion with the life of Krishna—the first, Māl Dwārakā, the 'original Dwārakā,' a little mound on the sea-shore between the mouths of the rivers Somat and...
EARTH, EARTH-GODS.

Man's ideas concerning the earth may be divided into three classes—cosmological, mythical, and religious. In some cases these mingle strangely, and, while man thinks of the earth as a created or artificially formed thing, he also regards it as more or less alive. The mythology entertained by various peoples was a mytho-scientific deduction from man's observation of what he saw around him. In no case had he any conception of the extent of the earth. To him it was merely the district in which he lived. He saw the sea, and believed that it encircled the earth like a vast river. Earth was usually thought of as a flat disk or oblong box floating on the ocean, while the heavens were regarded as a kind of dome, stretching above the earth and resting upon it or upon the waters, or propped up by poles or pillars. Such beliefs are found among lower races—Australians, Eskimo, the wild tribes of the Malay Peninsula, the Ewe of W. Africa, and others. In some cases the surface of the earth covers an 2.

1. Origin of the earth. Man's speculations did not limit themselves to the form of the earth; he bustled himself also with the problem of its origin, and the various solutions of that problem are found with wonderful similarity amongst widely separated peoples. In some cases direct creation by a divinity seems to be asserted. Thus in the sacred myths of the Quiches, preserved in the Popol Vuh, it is said that in the beginning there existed divine beings called 'they that give life.' They spoke the word 'earth,' and earth came into existence. An old hymn of the Dinka of the Upper Nile tells how, 'at the beginning,' Tengdet (on whom see ERE [v. 767]), a god dwelling in heaven, made all things. Similarly a native hymn from the Leeuward Islands tells of Telvi who 'slept in the void. No earth, no sky, no con. He became the universe.' So, too, a hymn of the Zulus describes Awenawul at the Creation, forming everything by thinking 'outside in space.'

But, generally speaking, where the making of the earth by a god is referred to, it is rather the framing of existing matter than creation that is meant. Thus some Australian tribes speak of the framing of the earth by a god, cutting it with his knife in many places, and thus forming creeks, rivers, valleys, and hills. As man himself shaped

2. Lejun, Religions der Steinzeit, 1909.
things out of clay or wood, so he imagined the Creator to have acted, and hence the native word for 'Creator' often means 'cutter-out,' 'moulder,' 'builder,' or 'forger.' In a whole series of myths from different parts of the world, but very common among American Indian tribes, the earth is formed out of a little mud or clay fished up out of the waters by a Divine being, often in animal form. This mud or clay is formed or grows into the earth. Of this myth the Vols and American Indians are probably the best instances. In most cases children of the gods are waters which have overwhelmed a previously existing world, and sometimes it is the earth itself which is fished up or rises out of the deep. This is found in an Atlantean myth in which the raven flies down to the sea and bids earth rise out of the waters. In a Polynesian myth the gods and god-goddess of the ocean, the brine dropping from which coagulated and formed an island. In another series of myths the earth is formed out of part of the body of a gigantic being, who is sometimes hostile to the gods and is slain by them, as in the Babylonian Tiamat, out of whose body, cut in two, Marduk made heaven and (apparently) earth.

Cf. the account preserved by Bezaeus of the gigantic woman Ommagotia of the Isani, who is cut in two, making heaven and earth of the other; and the Scandinavian myth of the giant Ymir, from whose flesh Odin, Vili, and Ve made the earth and the sky, and to whom the gods offered sacrifice in the gigantic first man. Purana, and out of him made earth or sky, men, moon, etc.

3. Heaven and Earth as a Divine pair.—The expanse of heaven and the broad earth were early regarded as personal beings, and also as husband and wife, in which such loving things as spring, being thought of as female. Their union was the source of all things in Nature, and, when the gods of departments of Nature were evolved, these were regarded as their children. Generally also they had mythological histories of their own. In most cosmogonies Earth is the fruitful mother impersonated by Heaven, though in some cases the Sun or the 'Great Spirit' is her husband, and they are universal pair. Mythology also solved the problem of their separation by saying that it had been formidable, and (in many instances) brought about by their children.

Many of Earth and Heaven as a Divine pair are found among African tribes, and, as among the Tofard, they are represented by the male and female Organs of generation, the symbolical poles of heaven and of earth. These myths are found among the African Indians, although with them the earth is sometimes taken as the male and the heavens as the female. In one myth the hero god Matato causes the removal of Heaven from Earth by magic. Similar ideas are widespread among the Polynesians, and in the Maori myth of Rangi and Papa it is their children, especially the father of forest-trees, who cause their separation. In other islands, gods, a sea-serpent, puma, or the first human beings, bring this about. Occasionally the

---

4. Earthquakes.—The movements of the animal who supports or exists within the earth are supposed to cause earthquakes (cf. Animals, § 10). Where a god or giant is the supporter, they are similarly produced, or a god or giant within the earth or an earthquake deity causes them. In other cases the dead are supposed to cause them, e.g. by shaking the palm on which the earth rests, or by struggling to reach the earth's surface. According to the chirags, the earth was created by shaking the earth. In the naive belief of the Caribs, an earthquake was held to be Mother Earth dancing and signifying to her children that they also should dance. 

5. Disturbing the Earth.—The idea that it is dangerous to disturb the Earth or to intrude into its domain, and that, when this is done, Earth must be appeased by sacrifices, is seen in the common custom of foundation sacrifice (see FOUNDATION), in which a human or animal victim is placed below the foundation when the earth is dug out. Frequently this is done to provide a spirit-guardian for the building; but there is no doubt that the propitiatory aspect came first. The analogous custom of sacrificing to rivers when crossing them makes this certain (cf. also art. BRIDGE), and reference may be made to the Japanese ji-ki-an-ari, or 'earth-calming-festival,' for 'propitiating the site of a new building.' Similarly the sacrificial ritual before ploughing, though it has the intention of assisting fertility, doubtless was connected with this idea, and expresses itself in such rites as that of the Chaus, in which ploughing is begun secretly, and is then carefully atoned for with sacrificial and lustral rites, after which it may be proceeded with. The thought is expressed in Sophocles' Antigone (339 f.): 'Earth ... men wears away.' In India, ploughing does not take place on certain days when Mother Earth is asleep. We find the same idea in Celtic myths of lakes which burst forth when a grave was dug, and in India, Earth is worshipped.
before a well is dug. Propitiatory sacrifices were frequently offered before gathering various plants.

6. Earth as Divinity.—Earth is generally known as 'Mother Earth,' depicted by the Aztecs as a many-breasted woman, like the Ephesian Artemis, who is the origin of Earth. Her most notable aspect is the broad-breasted 'Gaia', and the Zuul of Earth with her 'four-fold womb.' In primitive agricultural communities Mother Earth was propitiated with sacrifices, or worshipped with orgiastic rites, and such is still the case among many tribes of W. Africa she is the object of an extensive cult.

Among the aborigines of India, Mother Earth is worshipped mainly in conjunction with agricultural seasons, and as the image representing her was slain at a great festival and hidden in pieces, and portions of the flesh were buried or placed on the field. Among the Tutsis, Nerbunus (or Terra Mater) was specially worshipped by certain tribes in spring, her wagoon being drawn about the land by cows, and attended by her priest, probably in order to make the land fertile. Other goddesses worshipped elsewhere—Fria, Tamfana, and Nehalemnia—were probably in origin Earth-goddesses, while the giants Jordh, mother of Thor, is simply the Earth. Freyr, in some aspects a god of fruitfulness, had also a procession in spring, attended by his priestess, regarded as his wife. After this procession a fruitful year was looked for. Freyr was the son of Njôrdh, perhaps a male double of Njôrdh. Both Njôrdh and Freyr may be regarded as later male forms of an earlier Earth-goddess.

Traces of the cult of an Earth-mother among the Eskimos are very general, as an Earth-goddess, as the consort of the Celtic Disposer, Stamma, Divona, Domnu, Berecynthia, and others; while the Matres with their symbols—fruit, flowers, and a child—are the female extensions of the primitive Earth-mother. But, in accordance with a tendency for gods to take the place of goddesses which is not confined to Celtic religion, certain gods, primarily Earth-gods—those equated with Disposer, and Dagda in Ireland—are prominent. They are also under-earth gods. The older goddess now generally appears as the consort of one of these.

The Veil of earth-mother Prthivi was probably worshipped along with Dyans, and their epithets show their greatness and productivity, as well as their moral and spiritual character. But she is occasionally also associated with some other Earth-goddess. Bhûni, the soil, has a place in village cults, and to this divinity—now male, now female—cakes, sweetsmeats, and fruits are offered.

In Babylon, En-lil was god of the earth, but it is probable that an Earth-goddess had been first worshipped. Such a goddess may be seen in his consort Nin-lil, or in Damkina, 'lady of the earth,' consort of Ea. Probably the great mother-goddesses of the Semitic area—Ashart (q.v.) in Canaan, Atargatis (q.v.) in Syria, Ishtar (q.v.) in Babylonia, etc.—had been Earth-goddesses. They are connected with fertility, maternity, and the giving of children (hence she is regarded as a mother who has given birth and holding a child), and are called 'mother of men.'

Ishtar, at whose descent to Hades fertility ceases, in part symbolizes the death of earth in winter. But, since Earth and under-earth are closely connected, all the cults of Hades, may also have been an Earth-goddess, one name of Hades being 'Enlil.' The earth is also the object of an old Semitic belief, and thither he returned. Ishtar, mother of men, and Attika, receiver of men, are thus different aspects of one being. Earth is also called Ekhtyara, 'house of fertility,' in popular view the gods had sprung from the Earth, and Ishtar is also the mother of the Earth-gods.

The cult of Earth was primitive in Greece. Ge or Gaia was the Mother who sent up fruits. She had local cults and temples, and the fruits of the earth, as well as animal and perhaps human victims, were offered to Ge or Caprotrophor, the title Caprotrophor, applied to an otherwise unnamed goddess, is connected with 'Caprotrophi,' and recalls the belief that children or the first men come from the earth. Other goddesses were derived from or associated with the old Earth-goddess—Aprhodite, Semele, Artemis, Pandora, Aglauros, etc.—and in some instances an epithet of Ge (Caprotrophor, Theor) was separated from her, and became a new goddess. Demeter, 'Earth-mother' (Dana), or 'Grainmother' (Ibi, 'barley'), is certainly also a form of the Earth-goddess, but now rather of the cultivated earth. She is specifically a corn-goddess, but also, and more generally, a Goddess who 'sends us gifts' (Arpoitrophor), while her functions concern vegetation and the fruits of the earth as well as flocks and herds. She is also equated with Rhea-Cybele, herself a primitive Earth-mother.

The ritual of the Theaeuropäische points to Demeter, with Kore, as Earth-goddess. Live pigs, along with dough images of serpents and of the diana, were thrown into underground sanctuaries, and the rites was intended to promote the growth of fruits and of human offspring. The flesh of the pigs was afterwards mixed with the seed-corn, to promote an abundant harvest. All these offerings symbolized fertility, and the throwing of those into underground places resembles the custom of burying offerings to the Earth-goddess.

Kore has also characteristics of an Earth-goddess, and was once probably one with Demeter. She, too, is capacité, and in the representations of her return from Hades, the return of an
the awakening of the Earth in Spring, evoked by ritual actions, e.g. striking the earth with hammers, may be seen.1 While Demeter is said to have visited the fields with death and anger at Phito's rape of Kore, an older myth may have explained this as the result of her own disappearance, as in the case of Ishtar. The Phigaleian myth of her retirement to the house of Poseidon's violence, and the consequent death of vegetation, points also in this direction.2

The great goddess of the old Cretan religion was probably an Earth-mother, the prototype of the Greek Gaia.4 She moulds men and their coffins with the Cretan Rhea and the Phrygian Cybele, and who is primarily the fruitful earth, mother of gods and men. The Great Mother is often identified with Demeter and Gaia.

Among the Romans the primitive Earth-spirit, who was personified as Terra Mater, or Tellus, may also be seen behind each female divinities as Ops, Ceres (the equivalent of Demeter), Bona Dea, and Dea Dia. At the Forficatio, pregnant cows were sacrificed to Tellus, the unborn calves being torn from them and burnt, while the ashes were used at the Parilia along with the blood of the calf. This rite, which the Vestals were concerned, is clearly of ancient date and intended to assist Earth's fertility, or 'to procure the fertility of the corn now growing in the womb of Mother Earth.' Tellus was also invoked with Ceres at the Semestrum to protect the seed, and offerings of cakes and a pregnant sow were made.5 Tellus was associated with the underworld and the manes, as Demeter was with the dead, and she was invoked in the marriage ritual.6 Earth was thus to the early Romans, as to the Greeks, the giver of fruits, as well as of children, while to her, as to a kind mother, men returned at death (see the grave-inscriptions). The cult of Tellus and other divinities connected with the Earth was carried far and wide by the Romans, who assimilated them to local earth-divinities of other lands.

The ancient Mexicans knew Earth as 'Mother of all,' and invoked her at oath-taking, eating some earth sacramentally. Centeotl, goddess of the maize, must be regarded as an Earth-goddess. She was called 'our reverse mother,' and was sometimes represented as a frog, the symbol of the moist earth, with many mouths and breasts. She was also the bringer of children, and was represented bearing a child. Her festivals fell in the autumn and spring, and the old and the older woman representing her was slain.7 In Peru, where, as in Mexico, myth told how the first men came out of the earth, Pachamama, Mother Earth, was worshipped, e.g. at harvest, when corn and chicha was also carried on in grottos and caves, and oracles were sought there.

Sacrifices to earth-deities are laid on the ground, buried, or thrown into a hole.8 Human victims were often slain in agricultural ritual; the earth or seed was watered with their blood, or their flesh was buried, to promote fertility, whether the victim was a prophylactic offering or, as Fraser9 maintains, a physiologically representative of the deity of vegetation. Examples from N. America, Mexico, Africa, Indo-China, and India are cited by him;10 and he is also of opinion that the myth of Osiris' numbers scattered by Egypt may possibly be based on theirs,11 as suggested by the scattering of the ashes of red-haired victims over the fields.12

7. Earth and the Mother.—The belief in the earth as the mother of men may be seen in the myth which told how the first men came out of the earth, of which there are many N. and S. American, Zela, Eskimo, aboriginal and Peruvian instances.13 Greece also had myths of earth-born tribes (abro'dynores), as well as of Erichnionus, the son of Earth. In other myths, men emerge from stones, trees, plants, etc., or, again, the creator god comes out of earth or clay. These are divergent forms of the same myth.

The belief is further seen in the idea that children buried in the Earth may be re-born,8 and a connexion between the two ideas is found in the custom of barren women resorting to the place whence men may be re-born. Hence, as an expression of the belief in the restlessness of the shade whose body is left unburied may be connected with the idea that burial in the womb of Earth is necessary to re-birth. Hence also it is often sufficient to throw a little earth on the corpse to ensure rest to the spirit. Men were often buried in the position in which the child rests in the womb; or, again, the dying were laid on the earth, or a little earth was placed over them to facilitate the passage of the soul to its true home. Analogous is the custom of laying the newly-born child on the ground—probably as a consecration to Mother Earth, or to obtain her protection and strength.9

All these beliefs and customs, and the myth of Heaven and Earth as a Divine pair, are the result of the analogy which man saw between the processes of conception and birth, and those of the earth brings forth. Hence in many languages the words for begetting, sowing, and ploughing, for semen and the seed sown in the earth, for woman or the female organ of generation and the field or ploughshare, and for the mother of men, for earth, are the same, or are used metaphorically one for the other (abro, apero, Heb. zeva', Bab. zērē, etc.).10 Hence Earth was regarded as fertilized by Heaven, or by the rain (cf. the Egyptian formula 6, 'Rain,' addressed to Heaven and earth, 'Be fruitful' to Earth); hence, too, the myth of Earth sown with stones which spring up as men, or of plants growing from human semen spilt on the ground. Earth, as a fruitful mother impersonated as a female, was easily regarded as mother of men and κοιμητήρεια. For this reason the process or symbols of begetting are believed to react magically on Earth's productive powers, and conversely the rites for Earth's fruitfulness on that of man. The

rites of the 'Appropoaiia helped the fruitfulness of Earth and made the end of droughts were flung into the earth. Symbolic sexual acts, as well as sexual union, often performed on the fields, are held to assist fertility, and the myth of the union of Iasion and Demeter on a threepointed field probably arises out of such ritual acts. The marriage of Heaven and Earth is sometimes celebrated ritually, as in the Leti Islands, where the sun is supposed to come down and fertilize Earth at the rainy season, this being made the occasion of a festival in which the sexes unite. Women, because of the analogy of their fruitfulness with that of Earth, or because they first practised agriculture, have usually a prominent place in agricultural ritual. And, again, because of Earth's influence on human productiveness, or because children were supposed to come from earth, Earth is sometimes invoked in marriage rites.

8. Earth and under-Earth. Earth as the tomb of all became the abode of the dead; and hence many Earth-divinities are associated with the latter, since there is little difference between Earth and under-Earth, though growing out of it springing from below the surface. Traces of this are found in Celtic religion; and in Greece, Gaia was associated with festivals of the dead, and was also called Yg xep—s-an epithet also shared by Demeter, whose cult at Phlegraæa pres ages her connexion was the underworld; while the dead were called Astrapos. More obvious still is the connexion of Kore with Pluto, lord of Hades and giver of all blessings which come from the earth, just as Trophonios, an under-world deity, was the 'nourishing god. Most Greek Earth-divinities have this twofold character. The Roman Tellus was also associated with the moist world. Allatu, the Rahu, lady of Hades, may have been an Earth-goddess (§ 6), and, contrariwise, Ishtar may have been a goddess of the under world. Her images have been found in Phoenician graves; and Aphrodite, her counterpart in Greece, was occasionally associated with the under world. The death of Earth in winter would also help to suggest a connexion of the Earth-goddess with the region of the dead. Mythology, however, tended to separate Earth from under-Earth, and the death of vegetation was explained by saying that the Earth-goddess was detained in the under world by its ruler—Ishtar or Allatu, Kore and Pluto.

The connexion is further seen in the similar methods of evoking the return of the Earth-goddess in spring and the spirit of the dead, by striking the ground or striking the earth.

EARTHQUAKES.—See PRODIGIES AND PORTENTS.

EASTER ISLAND. I. Name, geography, and ethnology. Easter Island is the most easterly inhabited island of the Polynesian group, situated in the Pacific Ocean about 1000 miles south-east of Pitcairn Island, and forming an irregular triangle with an area of about 34 sq. miles. Its name is derived from the current belief that it was discovered by theesseract on Easter Day (6th April), 1722. The natives call it 'Te Pito to Henua,' or 'the navel and uternas,' from a seeming resemblance of the volcanoes Rana, Roraks, to the navel (plow) and Kao to the uternas (navel). In 1770 the Spaniards named the island San Carlos, and throughout southern Polynesia it is known as Rapa Nui, though this name dates back only to the seventeenth decade of the nineteenth century. It has also been called Easterland and Wada. Many explorers have visited the island, but none stayed long enough to make a thorough investigation, previous to the expedition of the United States Steamship Mohican, which remained there from 31st March to 31st Dec. 1886. The natives of Easter Island are of comparatively small stature, the largest skeleton measured on the Mohican expedition being somewhat less than six feet in length. They are usually darker, shorter, and fairer than the men. The children have somewhat the complexion of Europeans, but grow darker with age from constant exposure to sun and trade-winds, although the covered portions of the body retain their light colour. The coarse black hair is straight, or wavy, but never kinky, the nose straight, eyes dark-brown with thin dark brows and lashes, cheek-bones prominent, lips thin, and beard scanty. The general facial appearance corresponds (making due allowance for sculptural exaggerations) with the physiognomy of the statues. The breasts of the women are round, rather large, well-shaped, and ample, and their breasts and nipples but large areolas, though neither so great nor so dark as in many other Polynesian islands. In the oldest adult males the pilage on the body is often very thin.

2. Tattooing, which was introduced by immigrants from the Marquesas Islands some two centuries ago, is not practised at the present time, but the older natives are thus decorated, chiefly on the face, neck, waist, and legs, although no special design is adhered to, and its object is solely ornamental. The women are more elaborately and extensively tinted than the men. The bodies were also painted in certain times, whilst the clothing consisted of scant garments, chiefly of tapa or cloth, over the shoulders and about the loins. Feather hats were worn on various occasions, but without apparent religious significance, except possibly in cases of marriage-feasts, and when the chiefs used them as insignia of office.

3. The early population of Easter Island is unknown, but it is practically certain that it was never very great. It is known, however, that their numbers have suffered serious depletion in consequence of the brutal deportation of the islanders by Poru in 1805. In 1868 there were 900, but 900 were removed to Tahiti in 1873, and three years later 360 more emigrated to the Archipelago. At the time of the Mohican's visit in 1886 the natives still on the island numbered 155.

4. The general ethical status of the Rapa Nui, at least in modern times, is relatively high. The women are modest and of a higher moral standard than almost any of the other Polynesians. In disposition the natives are cheerful, contented, and hospitable. Intoxicating drinks, even kava, are wholly unknown. Thieving was common, but was not regarded as immoral. The thief was under the protection of a special divinity, and was believed to be detected only when the theft did not meet with the deity's approval. A system of retaliation existed, by which the person wronged might regain the property plundered, the thief being no wise forfeiting social respect or position. A darker side of their ethics, however, is presented by the cruelty which was meted out to those acquired foes after the conclusion of their wars. Pre-nuptial unchastity was common, and after marrying the husband was at liberty to lend or sell his wife to another for as long a time as he should receive her back without detriment to the self-respect of any concerned. Adultery, on the other hand, was punished with death. Divorce depended on the will of the married pair. Suicide was extremely common, infanticide rare, and
EASTER ISLAND

aberty rites were unknown. The aged found little respect or consideration. Despite Christian influence the object of cemeteries was very rare; but the ancient dances are still retained. These are essentially pantomimic, and in them the arms are employed more than the legs. A small dance, known as the 'hula hula', which is prominent features of the posturing. There are also huta-huta dances of an erotic type, but the sexes seldom dance together. The huta-huta seems to have been danced chiefly at the annual election of a military chief, the celebration in honour of it lasting a month.

5. Amusements to-day, except as a marriage-rite, are very rare; but the ancient dances are still retained. These are essentially pantomimic, and in them the arms are employed more than the legs. A small dance, known as the 'hula hula', which is prominent features of the posturing. There are also huta-huta dances of an erotic type, but the sexes seldom dance together. The huta-huta seems to have been danced chiefly at the annual election of a military chief, the celebration in honour of it lasting a month.

6. In ancient times the government of Easter Island was an arbitrary monarchy. The supreme authority, which was quasi-priestly, was vested in a king, and was hereditary in his family. He ruled over the entire island, which was divided into districts, each named and presided over by a chief. There was no special code of laws, custom defining the rights and duties of natives. For the most part, the ruler was entirely independent of any other, and in the continual conflicts which took place the king and his family were held sacred and were not troubled by either victory or defeat. Since the kidnapping of the prince of Matavea and the murder of his family, the last of a long line of kings, by the Peruvians in 1865, and their subsequent death in slavery, there has been no acknowledged authority among the Rapa Nuis.

7. In war the only weapons known to the natives were obsidian-pointed spears, short clubs, and stones, all of which were used with great skill. Shields were unknown, and there was no class of trained warriors.

8. The ancient islanders buried their dead lying at full length, usually with the head towards the sea. The bodies were wrapped in dried grass bound together by a sedge mat; but later tapo, or native cloth, was used instead of the mat. There seems to have been no special place of burial, although the platforms and the caves were favourite depositories for the dead. The bodies are now frequently exposed to animals and the elements, and are later thrust into their final places of interment without ceremony. The skulls of chiefs seem to have been marked with special clan-tokens, and numbers of such crania have been found.

9. Cannibalism was practised until a recent date, and an old legend states that children were sometimes devoured by their parents to satisfy the craving for human flesh. There is no evidence, however, that cannibalism was a regular ceremony.

10. The general style of architecture seems to have been of two kinds. The more permanent form was that of the rectangular house built of bark or reeds and supported by posts set in the interstices of the stone foundation. These structures were from 10 ft. to 15 ft. in length and 6 ft. to 8 ft. in width. They had a thatched gable roof and nearly straight sides, one of which, contained the door. In constructing the stone part of such a house, a convenient hill or rock was generally taken for the back wall. From this were laid side walls varying in thickness from 3 ft. to 7 ft., the shape being determined in great measure by the topographical conditions, and no definite plan was adopted. The front wall was constructed in the same way as the side, with the exception of the door, which was frequently set back from the posts. Over which was laid a slab of stone, the entrance averaging a height of 20 inches and a width of 19 inches. In some houses two doors are found. The material used was basaltic rock. The average proportions of these dwellings are as follows: height from floor to ceiling, 4 ft. 6 in.; thickness of walls, 4 ft. 10 in.; wall height, 12 ft. 9 in. respectively. The ceiling was made of slabs reaching from wall to wall. This was topped by a mound of earth, which was covered with sod, making the hut effectively rainproof. In a few instances there are dwellings, top openings, and more rooms opening from the main one. A small place was hollowed out of the wall of every dwelling to hold the household gods and any valuables which the inhabitants might value. This quasi-closet is remarkable in that it is frequently roofed by a true arch of lava with a keystone. Near Anahoïrangaro Point there is a round tower 12 ft. in diameter and 20 ft. in height, supposed to have been used as a look-out to observe the movements of turtles. Another such tower, whose shaft measures 244 ft., may be seen near Ahuakapu. It stands in the centre of a narrow platform 67 ft. long.

In Easter Island, as elsewhere in the Polynesian Islands, an important form of architecture was the construction of long, narrow platforms which corresponded to the houses of the natives. They are usually near the beach on high ground, and are built with parallel walls of squared stones laid together, but uncemented. Inside these walls, at irregular intervals, were built small tombs. Between these tombs and those containing walls, were thrown small stones until the horizontal plane of the platform was completed. Into this rubble were set the rectangular stones upon which the images stand. Finally, wings were built sloping from the horizontal plane to the ground. There are 113 platforms in all on Easter Island, each with a name. The largest, Tongariki, is 160 ft. long, 9 ft. wide, and 8 ft. high, excluding the wings, but with these it measures 540 ft., and the platforms vary in character and condition from this to mere shapeless masses of stone. Tongariki was adorned with fifteen statues, all but one of which have fallen face downward on the inshore side and are mostly broken. Another platform, named Vinapu, has six wings. Behind this is a round area 225 ft. in diameter. There is evidence to suggest that this was the ancient place of assembly for feasts and native ceremonies, and other platforms show similar spaces, the platform of Anaoraka having behind it a large triangle paved with cobblestones. Altars, which are said to have been erected for sacrifice, are found in the rear of some of the platforms. They are built of a single shaft, generally of vesicular lava, or sometimes of the material from which the images and crowns were made, and vary in height from 5 ft. to 10 ft., squared from 3½ ft. to 4 ft. on each face. They stand in the centre of a smoothly-paved terrace, and the sides and plinth are covered with figures sculptured in low relief, which, unfortunately, are too worn to be determined. There are traces of fire on the top of these stones, but no charred human bones have been found, so that the idea that they were used for human sacrifice may be discarded, especially as they are unlikely to have been used in the other Polynesian islands for this purpose.

11. The art seems to have been of a crude and simple type. Slabs painted white, red, and black have been discovered. Some of the figures upon them resemble birds, while others are remarkable reproductions of European ships. Sculptured rocks, some of which seem to be prior to all remains except a ruined village west of the town, have also been found. These are covered with fishes, turtles, and a bird-like figure which probably represents Moke Meke. On the wooden clubs and wide-bladed paddles designs of heads
EASTER ISLAND

may be plainly seen. Carved necklaces, which were never worn by the dancers, also exist.

All the stone for the monuments of Easter Island was quarried either in the southern part of the crater of Rano Raraku or else on the western slope of the mountain. The workshops of the image-builders were situated in both of these places. The workman first chose an appropriate rock, then made a rough drawing of his subject in a recumbent position, and finally carved and completed the figures with a keen eye for cutting away loose from the rock. This was done last of all, and with caution, to avoid breakage. There are about 285 statues in, or very near, the crater of Rano Raraku, in various stages of preservation. Their weight varies from ten to forty tons. An unfinished image, the largest on the island, measures 70 ft. in length and 14 ft. across the body. The head itself is 28 ft. long. The faces of these images, which alone are finished with any degree of care, have receding foreheads, high cheek-bones, straight noses, firm lips, long orthognathous chins, and ears of an exaggerated oval shape, possibly representing the very common elongation of the lobes by means of pendants. The backs of the heads are square, on account of the way in which the statues were freed from the living rock. Little care, if any, was given to finishing the body, which in no cases seems to have been cut from the living rock. In three or four instances female statues occur. In feature the images correspond closely with the household gods already mentioned, except that the latter are made of wood, with eyes of bone and obsidian; and, unlike the images, they have the body entirely finished. They range from 2 ft. to 8 ft. in length, and are more modern than the stone household gods. The usual view is that they were images of noted persons; but from the analogy of Polynesian religion in general they seem originally to have been closely connected with the cult of deceased chiefs, or, in other words, were the outgrowth of ancestor-worship.

12. The language of Te Pito te Henua is unmistakably Polynesian, being most closely akin to the Maori of New Zealand, and this is the only island of the group which has an alphabet. There are four main tablets in the possession of the natives, each of which is believed to contain a different tradition. The characters on them are pictorial symbols, and were incised with obsidian points in straight lines on a sunken channel. Some of these tablets seem to have been made of driftwood, very possibly parts of a canoe. They vary in size from 65 in. by 4 in. to 5 ft. by 7 inches. The art of reading them was hereditary in the families of the kings and chiefs, although in isolated cases a priest or teacher might decipher them. Ure Vaeko, an old inhabitant of Easter Island, related the traditions contained in the tablets, and his version was afterwards corroborated by another man, Kaitae by name, who claimed to be directly descended from the last king, Manara. At least approximate translations of these are given by Thompson and Geisler (op. cit. infra).

13. The early religion of Rapa Nui was distinctly Polynesian in type. The chief god was Meke Meke, who was the creator of all, and who is represented either as a godling (or ongono, or in the paintings, as a bird-like figure. In his honour a feast was held annually in July, at Orongo, when eggs of sea-birds were brought from the rocky islets of Motu Kau Kau and Motu Nui, a few hundred yards from Rapa Nui itself; he who first brought an egg unbroken having certain rights to food and other privileges, as being especially honoured of Meke Meke. This god is evidently the Polynesian Tangaloa, the sky-god, who is represented in many Polynesian cosmogonic myths as a bird, originally imprisoned in a gigantic egg (see Cosmogony [Polynesian]). There were numerous less important gods and goddesses, to whose conjugal union was ascribed the origin of all existing things, as told by one of the tablets. Unfortunately the account is too brief for any re-creation of the mythology, although it is mentioned in the inane "book of Akai, who called his wife Hepeue produced abidancy." It is known, however, that there was a god of fish named Mea Ika. There was also a god of birds called Era Nuku, whose wife was Manana, and who had the shape of a fish. Another bird-god was Mea Mon, while the bonito fish had a distinct deity, Mea Kahi. The god of theft has already been mentioned. Legend traces the coming of the Rapa Nui, under their king Hotu-Matua, in two proce from the west, and likewise tells of a conflict between the Vinapu and Tongoiki clans which resulted in the destruction of platforms and the over-throw of statues. The most famous god was the large stone called "dead," while those yet standing are "alive," and are believed to have slain their prostrate foes. This tradition may well represent an actual inter-necine war, which would not be unprecedented in Easter Island. It also explains the deification of the twin-gods, called the "dead," while those yet standing are "alive." Either tradition, however, is extremely doubtful, especially as the platforms where they are placed are favourite places of burial. It is more probable that the statues and, at least to some extent, the household gods, through whom communication was held with the spirits, represent the ancestor-cult of the early Rapa Nui, and that they thus find their analogue in the Melanesian images erected as memorials of tindales, although having in themselves no mana, or supernatural power (cf. Codrington, The Melanesians, Oxford, 1891, pp. 173-174). The statues are still objects of veneration to the natives of Easter Island, and are even being acquired by possession in the same way as the early tablets were protected by tabu (called rahi in this island), which is indicated in Rapa Nui by a white stone set on three common stones. The household gods seem to have received some sort of homage at the principal feasts, especially at the time of the ripening of the fruits, the fishing season, and the gathering of eggs. Temples were unknown, and worship was performed in the open air. The problem of altars has already been discussed.

Fetishism was also part of the religious belief of the island. The tinoike, or fetish-board, was a whalebone paddle, 30 in. long by 14 in. wide, which was waved to the accompaniment of incantations to injure an enemy, while the rapet, or potato-fetish, a double-bladed paddle some 2 ft. long, was employed in similar fashion to protect the potato crops against drought or insects. Still more interesting are the atua mangerio, or fetish stones, small pebbles, either rough or fashioned, which were buried beneath the houses to ensure good fortune. In early times the Easter Islanders had many superstitions, and had recourse to prayers, charms, incantations, and amulets to ward off evil and to bring good luck. They believed in a future life, to which, after death, the soul departed, there to be rewarded or punished as it deserved. For this
has long ago extended greatly towards the North and includes the Russians, she continues none the less to give herself the title of 'Eastern,' and thus to recall, on the one hand, the former eminence of the Orthodox Church of the East, and to bind her- 
self, on the other hand, to the ancient Church of which she claims to be the canonical and genuine heir.

Besides the Christians of those ancient lands in which the Orthodox Church prematurely extended her bounds, she has numbers now about a hundred million believers, to the Russian amongst them. The Russians. She consists of fourteen self- 
governing Churches, that is, Churches completely independent and autocephalous in regard to in- 
ternal administration. These are as follows:

1. The Ecumenical Patriarchate of Constantinople.
2. The Patriarchate of Alexandria.
3. The Patriarchate of Antioch.
4. The Patriarchate of Jerusalem.
5. The Archipelagoate of Cyprus.
6. The Church of the Bulgarians.
7. The Church of Greece.
8. The Metropolises of Cario and Cyprus.
9. The Church of Rome.
10. The Church of Servia.
11. The Archipelagoate of Montenegro.
12. The Metropolitans of Herzzstadt.
13. The Metropolises of Bukovina and Dalmatia.
14. The Holy See of Jerusalem, which is attached for spiritual matters to the Patriarchate of Jerusalem.

All these Churches, though separate and inde- 
pendent, yet constitute one body, inasmuch as they possess (1) the same faith, (2) the same principles 
of government, and (3) the same bases of worship.

The common Faith. — The common Faith of the Orthodox Churches is drawn from the two 

sources of revelation, according as the infallible Church has understood and interpreted them through her hierarchy, either assembled in Synods, or by themselves teaching each the same doctrine.
The fountains and the rule of dogmatic instruction are the doctrinal decisions of the Ecumenical 
 Councils, or those of local Synods confirmed by an Ecumenical Council. As secondary sources,
Expositions of the Faith are used, such as have been ecclesiastically accepted, inasmuch as they agree with ecclesiastical doctrine. Such are the so-called Symbolical Books of the Eastern Church, 
 especially the Orthodox Confession of Moglas and that of Dositheus. The chief points of Orthodox 
dogma are as follows: — Man, having transgressed the commandment of God, fell from his original righteousness, and, by the sin of Adam, 
lost the true knowledge of God, on the other hand, 
leaning generally towards evil. But the Son of God, having become incarnate, and having been sacrificed on Golgotha, reconciles sinful mankind with God, and establishes His Church for the contin- 
ual supply of the benefits of the Cross. Thus the Church is the storehouse of truth and of sanctifying 
grace; through her the believer is taught the genuine contents of the Faith, and by means of her seven Sacraments (Baptism, Anointing, the Eucharist, Repentance, Ordination, Marriage, Ex- 
traordinary) he is both justified and edified, through faith working by love, in the work of sanctification and in advancement towards all that is good. The Saints are honored as models of 
faith and virtue (by feasts, pictures, and relics), and their intercession with God is requested (cf. the Symbolical Books of the Eastern Church; the published by Kimmel in two vols., Jenae, 1843). The reader may further consult the numerous 
Orthodox Catechisms, of which the principal is that of the Russian Plate; and the dogmatical 
works of the Russian Antonie, of Sylvestre, and in Greek those of Rossi's System of 
Diagnostics of the Orthodox Eastern Catholic Church 
(1 vol., Athens, 1903), and Androuoto's Symbolica

134

EASTERN CHURCH. — The Church which 
believes herself to be the canonical heir of the ancient Church remaining in the Faith, 
and Orders of the first ages of Christianity, is called 'Orthodox' or 'Eastern.' Both these names 
distinguish her from, and contrast her with, her sister, 
the Western Church, which has excommunicated 
her, as well as from all the Protestant communities 
which have seceded from the latter. The name 'Orthodox Church,' on the one hand, expresses 

the idea that she is the Church of Christ which 
maintains the correct belief; the appellation 'Eastern Church,' on the other hand, in connection 
with the division of the ancient Roman Empire, 
points primarily to the Eastern half in contrast with 
the Western Church, which is the centre of the 
Church of Rome. Yet, inasmuch as the Western 
Church, under the Pope, by introducing innovati- 
sions regarding the foundations of government 
and regarding faith, at length separated herself from 
the Orthodox Church, the term 'Eastern' acquired a moral significance, pointing to the 
Church as the possessor and champion of the ancient traditional faith, in contrast with 
the degraded and Apostate Church. Thus also, though she

1 Besides this general article, there are separate articles under the titles Greek Church and Russian Church, to which this article is intended to be an introduction.
from an Orthodox Point of View (Athens, 1901), and Dogmatic of the Orthodox Eastern Church (Athens, 1907).

2. Church government. The second claim binding the autocephalous Churches into one whole is the common principles of government. These principles are supported by the holy Canons, by the Fathers, and by the administrative laws of the Eastern Churches, referred to in the Church and completed in the Canons. Among these canonical collections, entitled Nomocanon, the most important is the Code given to Photins, which was sanctioned in 920 by a great Council in Constantinople, and proclaimed as having authority over all the Eastern Church, constituting the fundamental collection of her laws. Modern collections are, on the one hand, the so-called Buddha of the Intelligent Ship of the one Holy Catholic and Apostolic Church of the Orthodox, published first at Leipzig in 1800; and, on the other hand, the Constitution of the Divine and Holy Canons, published by Kall and Pofi at Atos (Athens, 1897) (Greeck).

According to the principles of Orthodox government, the head of the Church is Jesus Christ; but believers are distinguished into clergy, consisting of three grades (archpriests, priests, and deacons), and laymen, consisting of the faithful. A single organism resting upon the monastic arrangements of Basil the Great, reduced to order by means of legal commands of ecclesiastical and political legislation.

The monks (whose first and second orders wear cassocks) are spiritually subject to their local bishop, excepting the monks of the stauropegia and of the Imperial monasteries. The monasteries are distinguished, according to their regimen, into cenobitic and idiorhythmic.

The centre of each Church is the bishop, but the basis of administration of the autocephalous Churches is the Synodical system, all questions of ecclesiastical administration and discipline being solved in regular or periodically convoked Synods. Not only spiritual questions affecting ecclesiastical life and hierarchical organization are regulated by Church law, but partly also many relations of social life, which are bound up closely with that of the Church, such as questions of marriage, divorce, etc. In spite of all the differences which, owing to their relations towards the civil government, are seldom very distinct in the organisation of the Church, the common spirit of administration appears everywhere. Many Canon Law regions, like the Church of the Orient in the best of them being Ecclesiastical Law, composed by Milasch at Zara in 1902, of which a second edition has appeared.

3. Worship. The third mark of the unity of the Orthodox Churches is the common basis of worship. No one liturgical language holds the place in the Orthodox Church that Latin does amongst the Roman Catholics; every race performs its service in its own tongue. The Table of Feasts of the Orthodox Church rests on the Julian Calendar, which has thus an ecclesiastical significance; hence a reform of it, bound up as it is with ecclesiastical life among the Orthodox, cannot be separate from the secular.

The churches are nearly all built on the same plan; the holy place is separated from the rest of the temple by the shrine for pictures.

The Church is distinguished as 'great,' because they relate to the Lord Jesus or to the Mother of God, or as Saints' days; but the central one is the Paschal feast (Easter). Easter, Christ-

mas, the Assumption of the Virgin, and the anniversaries of the death of the Holy Apostles are preceded by fasts of many days; other fast-days being also Wednesdays and Fridays. The 1st of September, the 29th of August, and the Eve of the Epiphany.

The stronghold and centre of the whole worship is the Liturgy, of which two types are used—that of Basil the Great and that of Chrysostom, which is usual throughout the year. The Liturgy of the Pre-sanctified, called, after the nomenclature of Gregory, the Dialogos, is reified only in Lent. Preaching of the Divine word, for the explanation and imparting of Christian truth, which was anciently an inseparable part of public worship, has now disappeared, and only in Russia does it show some signs of life. Common to all the Churches are certain books for the offices of the Feasts and the Sacraments. (1) Τιμίατο. The Typikon is a book which fixes the canonical psalms and hymns to be used, as well as the mode of conducting the services, for the Sundays and for the other days of the year, as well as for the different festivals. (2) Παναγιεύσιον. The Euchologion contains the order of prayers for the seven Sacraments, and other prayers for different occasions. (3) Προσκύνησιον. The Horologion contains the seven kinds of prayer, the daily prayer, that is, the first, the third, the sixth, the ninth, Vespers, Midnight, and Dawn. (4) Τριωδίον. The Triodion contains the hymns to be sung during the whole of the forty days which precede Easter. (5) Πραγματολογίον. The Pentecostarion contains the hymns to be sung from Easter to Whitunday. (6) Πασχαλικια. The Paraklesies contains the hymns of John of Damascus and others, which are sung from Whitunday onwards. (7) Μεμεριακα. The Menacae contains hymns for all the Saints' days and festivals of the year which are not contained in the Triodion and the Pentecostarion. (8) The Psalter, the Gospel, and the 'Apostle.' The music is vocal and idiorhythmic, and is pleasing when it is well performed. Instrumental music and graven images are forbidden (cf., for the Table of Feasts, the Calendar of Nilles, and for the music the Literature of Krumlacher, in Byzantinische Litteratur, Munich, 1897, p. 599 ff.).

4. Character of the Orthodox Church.—The essential features of the Orthodox Church are two: (a) theoretical, that she preserves and keeps unchangeable doctrine handed down by her (Traditionalism); and (b) practical, that she avoids excess or bias in external ceremonies (Ritualism). The first which, in a word, are the invariable, the unchangeable base and the marvellous beginning of Christianity, because this, according to the Orthodox, is not something empty and invisible, but a revelation having a firm and definite content in regard to faith and the bases of worship and administration; and the Orthodox Church, tolerating no innovation, claims to preserve and exhibit as much as possible the supernatural essence of Christianity. From her point of view, the Western Church came in a rush of development with ancient tradition, and Protestantism is a subversion of traditional foundations, whereas she herself claims to teach essentially what was taught by the Church of the first ages. Certainly, that keeping of the traditional Faith does not prevent the theological development and the many-sided investigation of Divine truth. And if, from the 8th cent. onwards, treatises about Christian truth are the least, it does not follow that the East has been at fault, not, at least, that the East has been at fault, not, at least, that the East should be blamed for not being the inexhaustible source of rich theological research, but to external causes, to well-known political circumstances.

All who visit the Churches of the East are
forcefully struck by the attention to external forms. Whereas the main aspect of the Western Church is that of an administrative institution, having a well-formalized system of obedience to the authority of the priests and bishops, whilst Protestant Christianity is principally a matter of teaching and preaching, the Orthodox Church, having on the one hand a loose administrative system, and on the other hand a lifeless preaching, appears unable to hold a society for worship. Thus dogma is put aside or hidden in the external forms of adoration; the whole religious being of the Orthodox appears generally in reverence and submission to her numerous rites. But surely religious ceremonies are the necessary expression of the internal spirit; and is it not reasonable that the Orthodox Church, having been distinguished of old by her rich religious life, should afterwards lapse? It forms a prevalent explanation of censurial canibalism in the employment of a man-god.

The sacrificial form of canibalism obviously springs from the idea that a victim offered to a supernatural being partakes in his sanctity, and from the wish of the worshipper to transfer to himself something of its benign virtue.18

Censurial canibalism has been a regular institution among the peoples of Central America, in parts of Peru, in Nigeria and various tracts of Equatorial Africa, and in certain islands of Polygon and Moluccas.19

The most remarkable development was in Mexico. At every sacrifice the victim bore the name and filled the rôle of the god. Acosta observes: "More they did sacrifice him, they gave him the name of the idol to whom he should be sacrificed, and armed him with the same ornaments like their idol, saying that he did represent them.20"

The annual representative of Tezcatilpoecs, after a year's luxurious living, was sacrificed at the grand festival. His heart was offered to the sun. His legs and arms were served up at the tables of the lords. The 'blessed food' was chopped up small.21 At the feast of Xipe, prisoners of war were eaten. They were termed tootototli, 22 dicing in honour of Totec.23 A thigh was sent to the king's table. The dish was called tecatlautli. The giver of each feast did not eat of his own captive, but of those of others.24

In Cholula a slave of fine physique was sacrificed as the representative of the sun, and eaten.25 The Mayas ate the flesh of human victims sacrificed to the gods, as 'a holy thing.'26 In Carancue, a province of Peru, it was the custom to eat the flesh of persons sacrificed to the gods.27 In Nigeria, human victims offered to gods are eaten by both priests and people; the flesh is distributed throughout the country.28 Traces of the rite are found in Vedie India.29

Where the god is a deity of the corn, he may be eaten in his anthropomorphic substance or in the form of grain or bread. The Mexican theophagy of Huitzilopochtli is an important example of the rite, though the cult is apparently composite.

A colossal statue of the god Huitzilopochtli 'dough was broken up and distributed among the worshippers. The ceremony was described as killing the god, his body might be eaten,' and was termed teopemal, 'god is eaten.' Women were not allowed to partake. The dough was made of all kinds of seeds and the blood of children. The exhibitd in the temple, the image was 'slain' by the priest, who pierced it with a dart. The heart was eaten by the priests, the rest of the 'flesh' was broken up small and all males received a portion. Smaller images of dough were eaten at other festivals. Reasons assigned were to procure good health, and, in the case of warriors, to increase their strength.30

Analogous cases of the offering of images of divine beings made of bread are adduced by Frazer.31 Holy wafers are often in the form of wafers on which the divine image is stamped in relief. This method may clearly arise without reference to the principal of substitution to be seen in the case of the Christian Eucharist, where it is unnecessary to assume that the stamped wafer is a substitute for an actual lamb.

In so far as the fruits of the earth are conceived as the embodiments of divine beings, the sacramental eating of the new fruits is a form of the rite of eating the god.32 In some cases this solemn act of assimilation is preceded by a purgation, both physical and moral. The intention in the former aspect is to prevent the sacred food from being polluted by contact with common food in the stomach of the eater. For the same reason Catholics partake of the Eucharist not only as the lawful to partake of it after a meal. Lent was originally regarded as the fast preparatory to the Easter communion. Communion, often associated with fasting, was also prescribed before communion.33 A transition from sacrament to sacrifice in this connexion has been suggested.

of a god; but a portion of them is presented as a thank-offering to the gods by those who believe in and produced the sacrifice. Sometimes the first-fruits are presented to the king, probably in his character of a god. Till the first-fruits have been offered to the god, the people are not at liberty to eat of the new crop."

In Wermland (Sweden), the peasants eat loaves made from the grain of the first harvest. The loaf is in the shape of a girl, and represents, according to Frazer, "the corn-spirit conceived as a maiden."

Similarly in France, at La Palisse, a man of dough is broken in pieces and eaten, at the end of harvest. The Lithuanian festival of sacriphoria included the eating of loaves ceremonially made from all kinds of seeds. One little loaf was given to each member of the household.

In Ebro, at the end of rice-harvest, each clan has a special meal to which each member contributes some of the new rice. It is termed "eating the soul of the rice." Similar rites are observed in Celebes, among the Hindus, Burghers, and Chinese, in the United States, among the Chews of China.

In Scotland, grain from the Old Wife, the last sheaf cut at harvest, is given to the horses, in order to secure a good harvest next year.

The worshiping of the Ainus of Japan paid to the bear "appears to be paid only to the dead animal." Though, whether alive or dead, it is described as "kamun—a term similar to the sopi of the Masai, the nambo of the Cherokees of the North Americans, and the manos of the Melanesians—it is slain whenever possible; its flesh is a staple food, and its skin furnishes clothing. But at the annual bear-festival a bear was 'worshipped' and then ceremonially slain. Its blood was drunk by the male members of the family. The liver was eaten raw by women and children as well as by men. The brain was eaten with salt. The heart also was eaten. The rest of the flesh was kept for a day, and then divided among all who had been present at the feast."

Similarly the Gilyaks of Siberia pay a certain measure of "worship" to a bear, prior to its sacrifice.

After being shot to death with arrows, it is prepared for food. The flesh is roasted and eaten in special vessels of wood finely carved. They drink out the flesh raw or cooked, as the case may be. Aine do. The brain and entrails are eaten last; and the skull is placed on a tree near the house. Then the people sing, and dance, and dance, and dance, and dance in round measure.

A more detailed account supplies a valuable type of such theophagous ceremonies:

"The breth obtained by killing the meat had already been partaken of. The wood-bellows, platters, and spoons out of which the Gilyak's eat the broth and flesh of the bears on these occasions are always made specially for the purpose at the festival, and only then; they are elaborately ornamented with carved figures of bears and other devices that refer to the animal or the festival, and the people have a strong superstitious scruple against partaking with them. While the festival lasts, no salt may be used in cooking the bear's flesh, or indeed any other food; and no flesh of any kind may be roasted, for the bear would bear the hissing and sputtering of the roasting flesh, and would be very angry. After the bones had been picked clean they were put back in the kettle in which the flesh was boiled. And when the bear meal was over, the old man took his stand at the door of the house with a branch of fir in his hand, with which, as the people passed out, he gave them a blow. If any one had eaten of the bear's flesh or fat, perhaps as a punishment for their treatment of the worshipful animal."

In ancient Greece the worship of Dionysus seems to have included theophagy: Bulls, calves, goats, and fawns were torn to pieces and devoured by the worshippers. They believed, Frazer infers, "that they were killing the god, eating his flesh, and drinking his blood."

At the Athenian Dionysia the flesh of the slain ox was eaten by the participants in the ceremony. "The oxen slain at Great Baseum in Guinea annually to secure a good harvest are eaten by the chiefs."

Similarly, at a spring festival in China, the flesh of the sacrificed bull is eaten by the mandarins. It is possible that at the Thesmophoria, Athenian priestesses ate the flesh of sacrificed swine as a communion of the body of the god. Near Grenoble the harvest supper is made from the flesh of a goat killed ceremonially. Similarly, in the case of a slain ox near Dijon, the ancient Egyptians partook of the flesh of a pig sacrificed to Osiris. Instead of the pig, poor persons offered a cake of dough.

The Kalmucks consecrate a ram as the "ram of heaven" or the "ram of the spirit." The animal is tended carefully and never slain, when it is old, and the owner bequests him of consecrating a death and Corn, and the sacred meat is eaten but the flesh eaten. The Toda, by whom the buffalo is to a certain degree held sacred, is treated 'with a degree of adoration,' never eats its flesh, and except at a sacred meal celebrates once a year. A calf is killed in a secret place of the jungle, and its flesh roasted on a sacred fire. Women are not allowed to be present.

Frazer distinguishes two types of sacrifice: "sacramental killing" of the "animal god"—the Ainn and the Egyptian types. In the former the animal is one which is habitually killed, and the special sacrifice is a "special annual atonection" for the individual "god" of the species 'deity' being 'slain with extraordinary marks of respect and devotion."

The Toda ceremony is an example of the Egyptian type. The prohibition against the use of salt or leaven, or other modifying constituents, is noteworthy in the case of the ceremonial consumption of 'strong,' or 'sacred,' foods. The bread of the Passover and the Catholic host are unleavened. Sacred foods generally may not be mixed, and the prohibition of salt and leaven is no doubt a result of the same principle. 'Strong' foods, again, are as a rule forbidden to women, various reasons being assigned. Male selfishness, ideas of male superiority, connected with the custom of women wearing in public, are sufficient reasons for the prohibition, taken together with woman's natural aversion to such foods, and, in particular, to strong drink. In the 6th cent. the Council of Averroes forbade women to receive the Eucharist with the naked hands. Here a complication is introduced by the then prevailing notion of the natural impurity of woman.

As sacred bread is to the flesh of the god, so is sacred wine to his blood. As the 'worshipper' in the hunting stage of social evolution acquired strength and 'inspiration' by drinking the fresh blood of slain game, in the agricultural stage the process is repeated by drinking wine.
BATING the is and the quite relatives.'

In ancient Brahmanical Zoroastrianism the soma or haoma was in communion with deity. In the former case, as in the case of the Greek Dionysians, the wine itself had come to be anthropomorphized into a god.

But, as a general rule that the totem may not be slain or ill-treated in any way. But there are a few exceptions. The Narriyeri of South Australia were in the habit of killing and eating their totemic animals.2 Moreover, man being the lord of creation, his flesh is regarded as correspondingly 'strong,' and hence more nutritious and strengthening than any other. The Euahlayi Australians hold that what strengthens them more than anything, both physically and mentally, is the flesh of men.3

1. The sacrificial meal.

2. The ceremonial eating.

3. The ‘mythic meal’ of the Australian Intichisma.

4. The totemic animal or plant is not regarded exactly as a closed system, so that the man can kill his totem animal, and thus to enable him to perform the ceremonies for the multiplication of the breed. But these Australian sacraments, so called, are not only in the magical stage, but, to all appearance, devoid of any sentiment of loyalty to the totem or of any powers that he could show by mechanical and business-like aspect of magic rather than its emotional aspect.

There is no evidence of any rite of sacramental communion with the totem by eating its flesh, in cases where the totem may be regarded as a divinity.

1. The divine qualities of a man-god are supposed to be assimilated by the person who eats his flesh or drinks his blood. It was the idea of the early Christians concerning the Lord’s Supper. In the holy food they symbolized a real bestowal of heavenly gifts, a bodily self-communication of Christ, a miraculously imparting of divine life. The partaking of the consecrated elements had no special relation to the forgiveness of sins; but it strengthened faith and knowledge, and, especially, it was considered an oath of eternal life, because the body of Christ was eternal. The holy food was described as the ‘medicines of immortality.’

2. But, even in the early stages of human thought, the distinction between substance and accident is clearly held. The soul of man is nourished (hence the strength and life of his body) by the soul of the food.2 The accidents on both sides are either ignored or explained away. As materialism and spiritualism or animism become separated, the necessity is felt of bridging the gulfs between substance and accidents; hence theories of transubstantiation. Along other lines of symbolism and commemoration. The rite is symbolic of spiritual assimilation; or it is done in memory of a divine being.

In spite of meagre data, not likely to be augmented, the rite appears a logical corollary of several series of ideas. It is a case of convergence; the patent results of the assimilation of food are the basis of the homology. The animism and vitalism so deeply ingrained in religious thought and emotion seem to have a permanent warrant in the facts of nutrition. It is quite natural that the primitive mind should attach magical and animistic ideas to food, as such, and, in particular to flesh. Raw flesh is ‘living flesh,’ warm blood is instinct with life and soul. From the point of view of the magical assimilation of properties, human flesh and blood are the most valuable nutriment possible. But, in spite of occasional lapses into cannibalism, man has generally shown an instinctive repulsion to the habit or the perversion. And, if there is some mystery about flesh and blood generally, there is still more about the flesh and blood of men. Popular expression such as ‘I could eat you’ show that a normal tendency of this kind may exist.

Besides the fascination derived from mystery and even from repulsion, there is no doubt that human flesh of any other species, especially, is regarded as correspondingly 'strong,' and hence more nutritious and strengthening than any other. The Euahlayi Australians hold that what strengthens them more than anything, both physically and mentally, is the flesh of men.

1. It is easy to understand why a savage should desire to partake of the flesh of an animal or man whom he regards as divine. By eating the body of the god he shares in the god's attributes and powers. And when the god is a corn god, such as is indicated in the cases of the Nuer and the Arab, the flesh becomes the blood of the god. And, when the flesh and blood of the god is taken and eaten by man, he is correspondingly ‘strengthened’ or ‘made strong’ by eating of the god's flesh and blood. This ‘eating the flesh of the corn god’ is an act fraught with supernatural probability. Probably all such acts are a form of orgiasticism. So much is suggested by the psychology of cannibalism dictated by revenge, or even by love. Popular expression such as ‘I could eat you’ show that a normal tendency of this kind may exist.

It has been suggested that the killing of divine men and animals may itself be due expressly to a desire for assimilating, by eating, the divine properties. In order to assimilate these properties the surest method is that of physiological absorption, and slaughter is a necessary preliminary.4 On this view certain difficulties, such as that noted by Cicero, are apparently lessened.

1. It is not the spirit of the corn and vine, as such, but the life-giving virtue of bread and wine that is the essence of the sacrament.

Among early agricultural peoples, strong meat, such as flesh, is eaten but rarely. Often it is eaten only, as the drinking of wine is done in the same way. Similarly, the ancient Hindus allowed pregnant women the use of beef by way of strengthening the child.5 But not all theology is of the flesh of

3. GB II. 360 C: Cod. de Nat. Dier. II. 10 (41).
5. Crawley, 223.
animals or men. It was in the case of bread and wine that Cicero noted a difficulty.

While, therefore, by stretching the idea of godhead to include victims to the god, many animal and human sacrifices may be regarded as phallic rites, in which there may be a belief that 'god is eaten,' it requires an effort of imagination to hold such belief in the case of eating bread. But a comparison of the facts, both of spirit-belief and of the psychology of eating, shows that the custom is a development rather of the latter of the former set of ideas and practices. All the instances of eating, but few of them, are found in theophagy. For instance, as Westermarck shows, it includes the conception of the conditional curse. A significant case is the ordeal of the Eucharist, in which the swearer, after communicating in the body of Christ, prayed that in case of perjury the bread might choke and slay him. By the nature of the case, on the other hand, there must be either substitution, transubstantiation, symbolism, or analogy, in order to identify the food with the god. In the greater number of instances it would seem that this identification is rather with the divinity of the god than with the god himself.

The two most important instances, the Christian Eucharist and the Mexican theophagy, are in strong contrast. The latter is evidently a development from human sacrifice to ceremonial cannibalism, unless it was that a habit of cannibalism developed along with a habit of god-eating, which can hardly be regarded as a 'survival' of cannibalism. Much less can the Eucharist be so regarded, in spite of such analogies as may be hinted at in West Asian religions. On the face of it, and in view of parallel sacraments with bread and wine, it began in the form of analogy. The words, 'This is my body,' 'This is my blood,' are no survival of earlier and cruder rubries, but an imaginative direction to identify the sources of physical with those of spiritual nutriment.

**3. EBIONISM.**—I. **Nature and Origin.** EBIONISM, taken generally, is the name given to certain tendencies of thought, which crystallized into sects, within Judeo-Christian circles, in the early centuries of Christianity. The sects could have been called Jewish, if Jewish sects, set apart from Judaism it is impossible to understand them. When we remember that Judaism was a national religion, holding within itself a special revelation and a Law enshrined in the sacred treasure of its past; when, further, we recall with what tenacity Judaism clung to its Law, and what sacrifices it had made to preserve its historic identity and nationality—it will be understood what a ferment the new ideas of Christianity set up, and what a reaction of strenuous opposition they were calculated to raise. Ebionism, looked at historically, takes its place as one of the resultants of the future antagonism of Judaism to the simplicity and universality of the religion of Jesus Christ. The Ebionites had moved out of strict Judaism, but they had not moved into the Catholic faith. In a sense they were Jewish Christians; but their Christianity was nominal, and held by such a feeble thread that the slightest tension might snap it. So nominal was their hold of Christianity in its essence that the tendency of Ebionism was anti-Christian. In the years that followed, it became more and more heretical, until by the 6th cent. it had become practically extinct.

I. **Name and general interest of the sect.**—As 1877, an endearment to combine what was characteristic in Judaism with a faith in Jesus as the Messiah, the Son of God shall see, the name 'Ebionism' was given to more than one tendency of thought within Judeo-Christian circles. Some Ebionites were hardly distinguishable from the first Jewish Christians, from men and women, who endeavoured to combine the faith of Christ with the obligations of the Law and their national hopes. Others became strenuously antagonistic to the Catholic faith, and while retaining the name 'Christian,' became really hostile to the spirit of Christ. Finally, there were others who held a faith of a mixed or syncretistic character. While they accepted Christ, they accepted Him only as a revived Moses; and they combined in their creed elements of a heterogeneous character, in which Essenism and Gnosticism are plainly recognizable. But, amid all the elements which we describe as Ebionitic, and notwithstanding the heterogeneous teachings which gather round the name, there were two points common to all Ebionites. The first had regard to the Law, the second to Christ. Ebionism was at one in rejecting the Law and in deprecating Christ. The first point of agreement betrays the Judaism in which they had been reared; the second explains how they drifted outside the current of the Catholic faith and went on a journey of their own.

Why the name 'Ebionites' was given to those Judeo-Christian sects is not very clear. The tendency of the Church Fathers was to trace back each such sect as the Ebionites to a personal founder. Tertullian (de Præser. Hær.) in the 3rd cent. appears to have been the first to give currency to this view, which was held also by Epiphanius (Hær. xxx. 1. 17), who, without much critical judgment, regards Simon (called Hilarus or annimoque mendicus) as the author of the heresy. This explanation, which is without foundation, has been abandoned in modern times, though Hilgenfeld advocated it (Ketzergesch., 429 ff.). There can be little doubt that the name is derived from the Heb. פֶּרֶשׁ, 'poor.' But, while this is clear, it is not equally clear on what ground the Ebionites were so designated. The name gave scope for 'Patristic scorn,' and its bearers were denounced for poverty of intellect, poverty of faith, or poverty of Christology (Origen, c. Celsum, ii. 1; cf. de Princip. iv. 22, and in Matt. i. xxvi, rev. in Ebionit. ed. & trans. v. 8). Though the designation gave a convenient handle for Patristic sarcasms, it is improbable that its origin was so subtle. It is much more likely that it was originally a nickname of the Jews who dared to attach themselves to the religion of Jesus Christ, and who actually were among the poorer classes. The epithet, given originally in contempt, came to be used by Jewish Christians themselves, and gloried in, as describing sufficiently a characteristic of their order. By and by it lost its original significance, as names do; and in course of time it came to describe the sections of Jewish Christians who either failed to advance in faith or receded into mere or less of antagonism to it.

2. **Origin of sect.**—When we endeavour to account historically for the pseudo-Jewish Christians known as Ebionites, we are brought face to face with well-known facts in the minutiae and history of Judaism. Judaism, with its inheritance from the past, and its altogether unique appreciation of the Mosaic Law, was essentially a national religion. It must become the faith of the Jew, and should grow a Catholic faith, but in itself the religion of the Jews was intensely particularistic and national. From the records of the NT we see how there arose a form of faith, known as Jewish Christianity. In substance this was an endeavour to combine what was characteristic in Judaism with a faith in Jesus as the Messiah, the Son of God...
God, and the Saviour of the world. To begin with,
this Jewish Christianity must have held, as one of its
presuppositions, that the observance of the
Mosaic Law was necessary to Christianity (cf.
Harnack, Hist. of Dogma, Eng. tr., I. 298); and,
so far as it was associated with Jewish
Epiphanius Christianity, this remnant held
one of its characteristics, though, as we shall see,
some Jewish Christians were much more tolerant
than others. How, then, did this Jewish
Christianity become associated with the history of
the Church? If we read aright the history of the Apostolic
age, we see in it the gradual process whereby
Christianity freed itself from the swaddling bands of
Judaism—a process which was not achieved
without struggle. To the first leaders of the
Jerusalem Church the truth was not always clear
that the Christian religion was independent of
Mosaicism. The first concession wrung from Jewish
Christians was that, while the Law was binding on
themselves as Jews born, it was not essential for
Gentile Christianity to observe its enactments.
That concession was the emancipating act of the
Jerusalem conference, and it was due in large
measure to Jewish Christianity having gained of St. Paul's
influence. While the work and the teaching of the latter were
intelligible to the spiritually-minded men at the
head of the Jerusalem Church, and, however
resolutely the teaching of the Church was
by means followed that they were intelligible or
acceptable to the mass of the Jews who had become
converts to the Messiahship of Jesus. This is clear
from the hostility which dogged St. Paul's
footsteps from city to city; and it becomes clearer in
after-history, when that hostility developed into
Ebionism, which is simply the residuum of the
struggles and heart-burnings of the age when the
religion of Jesus Christ shook off the trammels of
Judaism.

At this point we are able to estimate the
influence of the national upheaval which ended in
the fall of Jerusalem in A.D. 70. It was an age of
passion, perplexity, and agitation; an age when
extreme men clamoured for extreme views; an age
which naturally gave birth to sectarianism. After
the fall of Jerusalem, the Christian Church was
re-constituted at Pella; but it was a changed
Church. The Jewish element in it had ceased to
be predominant. The passing away of the Temple,
the rude triumph of the Gentile, and the cruel
bands that had been laid on the sacred memorials of
the race had been cut off to cause a reaction which
Mosaic ritual staggered. Further, at Pella the
Church was recruited from the Essenes, and an
Essene element began to penetrate it. By and by
the Church came back to Jerusalem; and then
it came a final crash. Under Hadrian the Jews
rebelled; Bar Cohiba led a forlorn hope (A.D. 132);
the Jews were expelled from Jerusalem; sacrifices
were prohibited; Elia Capitolina was founded (A.D. 138);
and in place of the old Judaism, which
in turn had yielded to Judeo-Christianity, there
was a Church presided over by a Gentile bishop—
a Church in which Jews and Gentiles had become
one, Jew and gentile, who still clung to their national forms, and tried
to combine them with a belief in the Messiahship of Jesus, were driven into heresy. When the
Church had grown, which was a long
process, the tendency of those who retain that belief to
be heretical. The Church having outgrown
Jewish Christianity, Judeo-Christianities tended to
return to Judaism. The time came when Judaism
simply metamorphosed in the guise of Christianity.
Orthodoxy, when left behind by the culture of
the age, and deserted by public opinion, becomes
heresy' (Hipp.; see Hagenbach, Hist. of Doctrines,
I. 63).

II. FORMS OF EBIONISM.—When we begin to
inquire narrowly into the divisions of the sect, we
encounter considerable difficulties. Those arise
from the fact that the Fathers on whom we rely
for our information are not agreed as to who were
or were not Ebionites, and as to what precisely
constituted the Ebionite 'faith.' And at one period the nicknames 'Ebionites' and
'Nazarenes' were given indiscriminately to Judeo-
Christians. When the names lost their original
significance, and when Jewish Christianity in the
Apostolic age was compared with the Catholic faith
in the 2nd century, some Jewish Christians, for
the sake of searching out the differences, made
it easy to say what or where were the heretics
to whom the designation 'Ebionites' had come to be
applied. Moreover, when it is remembered that
these authors were in the habit of dividing
Christianity apart as Syria and Rome, and that writers had few
facilities for exact verification, it can be understood
that divergences in description were liable to creep
in. At the same time that, as a whole, the testimony is singularly consistent.

We may begin with a passage from Justin Martyr in the
middle of the 2nd cent., who, in his Dialogue with Trypho, tells
us that in his day there were two distinct classes of Jewish
Christians. The one he calls 'true' and the other
'false.' The former was associated with believing Gentiles, and did not insist on the observance of the
Law. The latter was not in fellowship with Gentile Christians until they had complied with
the requirements of the Mosaic Law (Dial. ¢. Tryph. ch. xvi.). Thus, we find that the Ebionites and the
Nazarenes were different words for the same
thing, and that both were simply Jewish Christians who,
like all other Judaeo-Christians, had a tendency
to live in the Jewish Dispensation; and who
in following this tendency the second class
fall out of the Catholic movement, and became heretical. Probably Justin
had in view the developed tendency of the second class when, in ch. xvii., of the Dialogue, he refers to some of the Jewish
race who 'acknowledge that Jesus is Christ, while holding
Him to be man of no mean.' Subsequent writers describe these Jewish Christians as 'Ebionites' and
as 'Syncretists;' and that tolerant section the name 'Nazarenes.' The distinction was clear in the 4th cent. to Epiphanius (Harr. xxix.), and to
Jerome. The latter found the Nazarenes dwelling in Persia
beyond Jordan, and classed them with the Ebionites, although
they held to the Virgin Birth and the Divine Kingship of
Jesus (3 Tim. 3. 1). We are on the eve of the
Christian East.

It is remarkable that in the writers who follow Justin, towards the
end of the 2nd cent. and the first half of the 3rd—the
Theban, Hippolytus, and Tertullian—there is only one section of Ebionite
known, viz. those who deny the Divinity of our Lord.
Irenaeus, in the end of the 2nd cent., is the first to use the name
Ebionites (Eus. x, 2, ii. 7, iii. xvi, i, xiv. xxili. 4, v.
1. 4). He is closely followed by Hippolytus (Hist. vii. 84; cf.
Perr. de Frater. ch. 96), while Origen (Advers. c. p. 22). in the 3rd cent., has several references to the Ebionites. In one he
says: 'Those Jews who have received Jesus Nazarenes
by the name of Ebionites' (c. Celts. ii. 1). In another he
makes reference to the Ebionites as 'deriving their name from
the poverty of their position in the Dispensation.
In other
instances, he writes of the twofold sect of Ebionites at Jericho (Kairos), who were acknowledged with the
truth by the name of Ebionites and who were
of the religion of a virgin, or deny this, and maintain that He was
be

(continued)
Jewish Christianity became highly syncretistic, as well as heretical. We may group the characteristics of all the Ebionites under the following divisions: 'Jewish Ebionites,' 'Pharisaic Ebionites,' and 'Gnostic Ebionites.' The relations between the different parts may be illustrated in a table, such as the following:

| A. Gentiles | (a) Non-Christian = Heathencism. |
| B. Jews | (i) Non-heretical = Judeo-Christianity |
| (ii) Heretical |
| (a) Those who accepted supernatural birth of Jesus, with undeveloped Christology. |
| (b) Those who accepted Messianship of Jesus, denied Virgin Birth, and hated St. Paul. |
| (c) Those who became gnosticated. |

1. Nazarenes.—The authorities for our knowledge of the Nazarenes are mainly Epiphanius (Her. xxix.) and Jerome (De Vir. Illus., § 3, and various passages in his commentaries). Epiphanius includes the Nazarenes in his list of heretics, but his account is confused; and in regard to their Christology in particular he confesses that he does not know much (Her. xxix. 7). He is aware, however, that the Nazarenes were executed by the Jews, and that they used the Gospel of Matthew exclusively. Jerome made use of a work by Josephus (ib. 9). According to Epiphanius and Jerome, these Nazarenes were to be found in the 4th cent. mainly about Pella beyond Jordan. Jerome had unusual facilities for knowing a great deal, and when we piece together the various passages in which we have any account of them (cf. Schliemann, Clement, p. 445 f.), we learn that they entertained the following beliefs: They accepted the Divinity of Christ, holding that He was born of the Virgin Mary. They admitted the Apostleship of St. Paul (cf. Jerome, in Is. iii. ix. 1, ‘qui novissimus Apostolorum omnium fuit’). Although they wished to retain Jews themselves and to retain the obligation of the Mosaic Law, they did not desire to bind these obligations on Gentile Christians, nor did they refuse to have fellowship with them. They mourned over the unbelief of the Jewish nation, and eagerly looked for the time when the Jews who loved them not should believe in Christ. It is difficult to describe their Christology, except that, as compared with the Catholic doctrine of Christ, it was primitive and undeveloped, and they held to the supernatural birth of Christ. They described Him as ‘the first-born of the Holy Spirit.’ The Holy Spirit was the παρθήνων των από τούτων of the apostle Epaphras (Col. ii. 9). They believed in the Divine Son, a ‘fons sanctitatis’ (Hipp., B. p. 319 e); Ritschl, indeed, holds that the author was a Nazarene (op. cit. p. 175). Anyhow, they held that, while their view of Christ had risen far above Judaism, and had not degenerated into Pharisaic Ebionism, it had not developed into the Catholic doctrine. It was an arrested belief. It may be added that there is a strong probability that the work called The Testaments of the Twelve Patriarchs, written not long after the fall of Jerusalem, and while the memory of that event was fresh, belongs to the circle of the Nazarenes. This is the view of Ritschl (Entsteh. d. altchrist. Kirche, p. 172) and of Lightfoot (Gal. iii. 319 e); Ritschl indeed, holds that the author was a Nazarene (op. cit. p. 175).

2. Pharisaic (non-Gnostic) Ebionism.—(1) Our authorities for this form of Ebionism are chiefly the apologists Ritschl, Deissmann, and Lightfoot. Ritschl, indeed, holds that the author was a Nazarene (op. cit. p. 175). Hippolytus (Her. vii. 22, x. 19); Epaphras (Her. xxxvii.); Eusebius (HE ii. 37); Tertullian (de Præser., xvii.); and Theodoret (Her. Fab. ii. 2). Our first authority is Ireneeus, accord-
bitter hostility to the Jews (Harr. xxi. 15, 25). We have seen that these Ebionite Ebionites used a Gospel of Matthew, and Ephraim gave us an interesting glimpse of the Baptist narrative in the recension of the Gospel used by them. The most striking point is the account of the voices heard from heaven at the baptism of Jesus: "Thus art thou my beloved Son, the Beloved in whom I am well pleased;" again: "I have this day begotten thee" (Harr. xxx. 20). Thus the Ebionite Baptist narrative, as given in the Ebionite recension of Matthew's Gospel, was clearly meant to show that the day of the Christ-birth dated only from the baptism, which Jesus received, the dignity of Messiahship (cf. Justin, Dial. c. Tryph. ch. xlv.).

(3) Certainly the most characteristic feature of Ebionitic Ebionism was its Christology. The life of the Jesus whom it recognized as the Christ fell into two distinct and clearly defined parts. At the point of cleavage stood the baptism. Up to the moment of His baptism Jesus was a man, on the level of common humanity, and inheriting the tendency of human nature to sin. His sonship up to the point of His baptism was purely ethical, and along the line of that ethical sonship it was possible, so the Ebionites said, for any man to be a Christ. Jesus was pre-eminent, in that first part of His life, for before He was, like other men, justified through the Law, but so pre-eminent was He in justice, prudence, and wisdom that He became worthy to be the Messiah, and at His baptism that seal of worthiness was placed on Him. It was His baptism, then, that made Him worthy to be the Messiah, and then only did He Himself become conscious that He was the Messiah; for, at that moment when the voice from heaven said, "This day have I begotten thee," there descended on Jesus, and entered into Him, a new power, viz. the Christ. This power was not God, and could not be God, for God was infinitely supreme and could not stoop to union with a man. Ebionism at this point was in accord with their Jewish rigidities, which it conceived to be the master-thought of Judaism. What then was this power? It was not God, but, though created, it had 'a proper pre-existing hypostasis.' This power was the Christ, who entered into union with Jesus, not to redeem the world, but to be the prophet of a new order, and to make known the Father. Then only, after the Christ had united with, and entered into the man Jesus, was He able to perform the miracles, and to work miracles. It ought, therefore, to be kept clear, in connexion with Pharisaic Ebionism, that the office of the Christ, so united with Jesus, was not re-demptionistic. The quaternity of the Christ quaternity, who was no mere impersonal power, with the man Jesus was not an indissoluble union, for the Christ before the death of Jesus departed from Him. Only at the resurrection again, the Ebionites have re-assembled and returned to "His own Pleroma" (Tren. iii. xi. 1; and cf. Lightfoot, Colossians, p. 261). It is clear that Gnosticism had already begun its work in connexion with the doctrine of the Christ. If, according to Gnostic speculation, matter was essentially evil, it was impossible that a spiritual Being, such a God, could come into union with it; and this led Ebionism naturally and appropriately for a time to become a Christology of Ebionism.

Gnosticism among the Ebionites. This form of Ebionism may be described (as by Harnack) as syncretistic Jewish Christianity. It is differentiated from Pharisaic Ebionism by the fact that it has incorporated in it elements which were not indigenous to Jewish soil. But the problem is not altogether simple—to trace, either as to their origin or as to their character, the speculative elements which are found in this type of Ebionism. The chief feature of these Gnostic Ebionites is Epiphanius (Harr. xix., xxx.).

Characteristics of their teaching are found also in Hippolytus (Harr. ix. 8-12, Clark's tr.), Origen (Euseb. HE vi. 38), and the pseudo-Clementines.

(1) We may best approach Gnostic Ebionism through the teaching of Cerinthus, to whom reference has already been made. The Ebionites had a Jew, 'disciplined in the teaching of the Egyptians' (Hipp. Harr. vii. 21, x. 17), and the sphere of his activity was in proselytising Asia (Harr. i. xxvii.; Epiph. ii. xxvii. 1). From this time a little after his death, the Ebionites appear already seen of his teaching, it is clear that it was Ebionitic. He held the obligation of the Law; he repudiated the teaching of St. Paul; he rejected the pre-existence of Jesus Christ; and he taught the millennial reign of the Messiah in Jerusalem.

The one point in which his teaching departed from typical Pharisaic Ebionism was in regard to his doctrine of creation. Cerinthus taught that "the world was not made by the primary God, but by a certain power far separate... from that Principality who is supreme over the universe, and ignorant of him who is above all" (Tren. i. xlvii). According to Cerinthus, an immense gulph yawned between God and this world. He bridged it by the conception of a power, inferior to God and ignorant of Him, the world-maker or demiurge (cf. Lightfoot, Col. p. 107; Justin, Dial. c. Tryph. ch. xlv.). The affinity of this conception of a demiurge with Gnostic speculations on the evil inherent in the physical world is apparent. In Cerinthus we have the first hint of what was to become the theology of Gnostic speculation linked with Judaeo-Christianity. He sets forth a teaching which was certainly heterodox, if not Gnostic or Pharisaic Ebionism; but on that teaching he has grafted a speculation which is certainly not Jewish. When the tendency thus shown in Cerinthus—the tendency, that is, to a treatment of Jewish Christianity in terms connected with Jewish Christianity—was further developed, we have Gnostic Ebionism.

(2) The character of Gnostic Ebionism may be ascertained from Epiphanius, though his account is somewhat confused. We learn, however, that these Ebionites agreed with those of the Pharisaic type in holding the validity of the Law, especially of circumcision, made null by the preaching of St. Paul, and in denying the Virgin Birth of Jesus Christ (Epiph. Harr. ii. 2, 4, 16). Their Christology was not uniform, and is somewhat indefinite. Some of them affirmed that Adam and Christ were one. Others regarded Christ as a spiritual Being, created before all things, and higher than the angels. This spiritual Being descended in Adam, was made visible in the patriarchs, and at last, clothed with the body of Jesus, rose again, and ascended back to heaven (Harr. xxx. 3, 16). We learn, further, that they spoke of Christ as 'the successor of Moses'—the only proper name of the Christ (i.e., Jesus), who was 'the Prophet of Truth.' Jesus himself was a mere man, who, because of super-excellent virtue, desired to be described as Son of God (Harr. xxx. 16; cf. Ritschl, "Christian History," ch. 12; Bockmuehl, "The Gospel of Dogma," i. 300). Christianity, therefore, with these Ebionites was simply true Mosaic, and Christ was the successor of the prophet of Sinai. The only part of the OT which they accepted was the Pentateuch, and even it only in part. Perhaps the most remarkable feature of their treatment of the OT was their rejection of the whole sacrificial system. In their recension of Matthew's Gospel (which Gospel alone they accepted) they added, as one of the objects of His coming, the abrogation of the sacrificial system (Harr. xxx. 16: ἕως ὡς καταλύει τὰς θυσίας, καὶ ἐν μία παρειχότα τὸν θρόνον, οὔ παρειχότα ἐν θαβάν ἢ ἑφιαλτικά). Further, they were vegetarians and ascetics. They abstained from flesh or wine, taking as their pattern St. Peter, whose food, they said, was bread and olives (Harr. xxx. 15; cf. Clem. Homilies, iii. 6). They also followed St. Peter in abstaining from marriage (Harr. xxx. 15, 21). The Lord's Supper they partook of with bread and water (ib. 16). Their asceticism on the point of marriage was originally strict, but it had been modified so much in course of time that they would not consider marriage highly (ib. 2; cf. Clem. Hom. iii. 68).
EBIONISM 143

If, then, we take the picture of these Ebionites, as given us by Epiphanius, we note at once that they have departed from the Pharisaic type in their religious line of direction. Their Christianity, while fundamentally alike, is mixed with elements of Gnostic speculation; (b) their asceticism is rigid, except on the point of marriage; (c) for the protection of animal sacrificial systems, the annals of Pharisaism contain neither precedent nor preparation.

(3) How, then, are we to account for these divergences from Pharisaic Ebionism? The problem is indicated by a solution seems to us to be involved. There can be little doubt that the influences incorporated in the form of Ebionism we are considering come through Esseniism. In this article it is not necessary to enter into a detailed description of the characteristics, origin, or history of the Essenes (see art. ESSENI), nor need we concern ourselves with the perplexing questions arising round this sect, so well described as 'the great enigma of Hebrew history' (Lightfoot, Colossians, p. 82). It will be sufficient to point out a few of the characteristics of the Essenes, as these are indicated by our primary authorities (mainly Philo, Qumran, and the pseudo-Clementine, Ephesi, in viii. 2-13, Ant. xviii. i. 5; and Flinn, JN v. 17). These characteristics may be given in the words of Josephus, which are followed closely by Hippolytus (Phil. v. 22):

‘These Essenes reject pleasures as an evil, but esteem continence and the conquest over our passions to be virtue. They never bestow goats or oxen on the poor children while they are pliable and fit for learning’ (JN vi. v. 2). ‘These persons are despisers of riches. . . . There is, as it were, one paltry book for all the family. For in their eyes, toward God, it is very extraordinary; for before sun-rising they spent a great part of the night in prayer, and put up certain prayers, which they have received from their forefathers, as if they made a supplication for their rising’ (§ 5). After describing their daily bath in cold water, and their measured eating and drinking, Josephus says: ‘They dispense their anger after a just manner, and restrain their passion’ (§ 6). ‘They inquire after such roots and medicinal stones as may cure their dissenterings’ (§ 6). He further says that novices are tried for three years. ‘If the (novice) appear to be worthy, they then admit him into their society. And before he is allowed to touch their common food, he is obliged to take tremendous oaths . . . that he will neither conceal anything from those of his own sect, nor discover any of their doctrines to others, nor take any one out of him so as to do him the hazard of his life . . . and will equally preserve the books belonging to their sect, and the names of the angels’ (§ 7). ‘What they most of all honour, after God Himself, is the name of their legislator (Moses), whom if any blaspheme he is punished capitally’ (§ 8). ‘They are similar to any other of the Jews in resting from their labours on the seventh day’ (§ 9). ‘Their life is stricter than that of their countrymen; they have no passion, and their superfluous life they dispense among the misery of their mind’ (§ 10). Their doctrine of anthropology, according to Josephus, is, ‘that bodies are corruptible, and that the soul which they name of it is not perishable, but that the soul is immortal, and continue for ever’ (§ 11). Josephus, further, tells us that there is another order of Essenes who agree with the rest as to their way of living, and customs, and laws, but differ from them in the point of marriage’ (§ 13). In another passage he makes this remark: ‘The doctrine of the Essenes is this, that all things are best ascribed to God. They teach the immortality of souls, and esteem that the rewards of righteousness are to be earnestly striven for, and when they send what they have dedicated to God into the temple, they do not offer sacrifices, because they have more pure instations of their own’ (Ant. xviii. i. 5).

Much of what Josephus records is confirmed by Philo, and may be quoted from Flinn: ‘There flock to them from afar many who, wearied of battling with the rough sea of life, drift into their system’ (JN v. 17). We are able, without further detail, to understand the leading characteristics of the Essenic Ebionism. It is a rigid asceticism, more especially in regard to food and marriage. They cultivated medicinal and medicinal stones. They preserved their books with absolute secrecy. Their devotion to Mosaicism was fervent. They practised a rudimentary sun-worship. They rejected animal sacrifices. They believed in the immortality of the soul only. On one side, they were true to their Jewish faith, for, in their regard for Moses and the Law and the Sabbath, they were simply ‘Pharisaic in a super-lative degree’ (Hipp. ii. 210). On the other side, in the secrecy of their monastic life, in their scorn of marriage, in their inquiet sun-worship, in their magical arts, in their rejection of all animal sacrificial systems, and in the doctrine of immortality they show remarkable and emphatic divergences from the Pharisaic type of Judaism, and such an influence from extraneous tendencies of thought, that Esseniism may properly be called the Gnostic Judaism; and which has difficulty in believing that it could be wholly a growth from Jewish soil (as Frankel), although it may be that it was the carrying out of the idea of a universal Jewish priesthood (as Ritschl). It is not material for us to inquire here as to the sources of these foreign customs and tendencies of thought—whether from Pythagorean sources (as Zeller), or from Parsi influences (as Lightfoot), or from both (as Schürer). One point, however, must be kept in view: that the Essenes, in their withdrawal from worldly pursuits, and in their doctrine of the immortality of the soul, show the influence of the Gnostic speculative inculcation—this again is an idea which reached a full development in Gnosticism.

We may conclude, then, that Gnostic Ebionism, in the form which we have described as an Ebionism, has assimilated elements from Esseniism. Its asceticism in meat and drink, its persistent rejection of sacrifice, and its speculative elements have come through Esseniism. In the matter of marriage the Ebionites of Flinn go back to Pharisaism, or to that milder party of Esseniism to which Josephus refers. If it be asked when the combination could have taken place, the answer is clear. Before the fall of Jerusalem a filtering down of Christian thought must have taken place. After the fall of Jerusalem the Essenes disappear as a separate party, and it is reasonable to believe that many of them attached themselves to the Judeo-Christian Church at Pella, observing, as they must have done, the fulfilment before their eyes of prophecies uttered by Christ in regard to the doom of Jerusalem (cf. Ritschl, op. cit. p. 223). When they took this step, it would be hard to imagine that they left their Esseniism behind them; and it would be incredible that an order and a system of thought so definite and so masterful as Esseniism should have been without influence in the development of Jewish Christianity.

(4) The form of Ebionism which we have described may be illustrated further from the Book of Ezechias and the pseudo-Clementine literature. In the one we see not merely the essential features of Essene Ebionism, but the indications of an effort to propagate the system westward; in the other we see Essene Ebionism assuming a literary dress. In regard to both, while we have the features of Essene or Gnostic Ebionism, as we have already described them, we seem to be standing at an advanced stage of Essene Ebionism that we may call the Essene Ebionism presented to us by Epiphanius. It will not be necessary here to go into the Gnostic Ebionism as it is thought in the book of Ezechias and in the pseudo-Clementines, with their differences and agreements with the other, and with Essene Ebionism as a whole. See, further, art. ELEKSAITEN.
The chief authority for our knowledge of the book of Ebionites is Hippolytus (\textit{Harr.} ix. 8-15, x. 23), whose account is in the main confirmed by Epiphanius (\textit{Harr.}, xiv. 3, xvi. 3, 6, xxii. 2, 3, 33, 39, 41, and \textit{Origen}, \textit{Cum. Inv.}, II. 13). Hippolytus, coming into personal contact with Ebionites, met them point by point in argument, and felt himself to be dealing with a living issue. He tells us that in the time of Callistus (that is, about the year 222) there came to Rome from Syria a man called Matthias, a cunning and full of schism (\textit{Harr.} ix. 8), who brought with him a book, \textit{Ebionites}, the contents of which had been the subject of direct revelation by an angel. Alcibiades asserted that the angel was 'Son of God, and with the angel went a female called Holy Spirit.' He also declares that he had been preaching unto a new remnant of Isma, in the third year of Trajan's reign (\textit{ib.} a. n. 100). Hippolytus characterizes this as the 'operation of the Holy Spirit' and the invention of the spirit infatuated with pride. The book, according to Hippolytus, insisted on circumcision and the Law. Its doctrine of Christ was partly Judaic and partly Gnostic. It taught that Christ was born as other men, 'but that both previously and that frequently again He had been born and would be born' (\textit{ib.} ix. 8). 'Christ' would appear and exist, undergoing alternations of birth, and have His soul transferred from body to body.' Hippolytus further tells us that the Ebionites 'devote themselves to the tenets of mathematicians, and astrologers, and magicians, as if they were true' (\textit{ib.} ix. 9). The chief point in the system of \textit{Ebionites} was its doctrine of the forgiveness of sins. Hippolytus gives us a clear account of His teaching on that point. The book taught forgiveness of sins on renewed baptism 'in the name of the Great and Most High God, and in [the] name of His Son, the Mighty King,' purging the person of all sin of their own accord, to himself those seven witnesses that have been described in this book—the heaven, and the water, and the holy spirits, and the angels, and the remembrance of the earth' (\textit{ib.} x. 1). Such a renewed baptism, along with the magical incantations of \textit{Elkesaites}, is scarcely necessary for sins only, such as drunkenness, sorcery, the infidelity of friends, or for accidents, such as a dog-bite. The book, finally, enjoining that its mysteries should be kept secret: 'Do not publish the same, nor publish them to the heathen, nor to the Greeks, nor to the Jews, nor to any other nation.'

From the account of the \textit{Ebionites} thus given by Hippolytus—an account confirmed by \textit{Epiphanius} and \textit{Origen}—it is clear that there were the strongest affinities between their tenets and those of \textit{Ebionites} and \textit{Elkesaites} as \textit{Christian}. It is quite possible that the Ebionites were a step in the development of Essene Ebionism (cf. \textit{Ritschl, op. cit. p. 222}). The Christology, which is the surest test of a sect, is in most respects alike. In both, Adam and Christ are identified, and there is the same belief in successive incarnations. The \textit{Ebionites} also agreed with the \textit{Essene Ebionites} in holding the obligation of the Law, in rejection of circumcision (with a consequent free handling of the \textit{OT}), in the doctrine of the forgiveness of sins, and in the beliefs of the \textit{Ebionites} is the doctrine of forgiveness through renewed baptisms and magical invocations. Undoubtedly, there is present here a heathen influence, foreign to Jewish soil. \textit{Ulhorn} has correctly described it as 'a strong heathen naturalistic element' (art. \textit{Ebionites}, in \textit{PRKE}). Probably this doctrine of forgiveness through renewed baptism was meant to take the place of the \textit{OT} sacrifices (cf. \textit{Clem. Recov.} I. 96). On the whole, then, we may conclude that the differences between the \textit{Essene Ebionites} and the \textit{Ebionites} were small, practically only the point of the addition of the new doctrine of forgiveness.

The roots of \textit{Ebionites} go back to that period after the fall of Jerusalem which, according to \textit{Hegesippus}, was the birthday of sectarianism (\textit{Eus. HE} ii. 32). In \textit{Ebionites}, \textit{Essene Ebionism} in the beginning of the 3rd century, and under strong heathen influences, took a step in a direction away both from Judaism and from Catholic Christianity, the impelling influence probably being the book of \textit{Ebionites}. It tended to the distortion of the \textit{Christian} world by the fiction of a new revelation in the pseudo-Clementine literature, as we shall see, \textit{Essene Ebionism} developed in other directions, equally removed from Judaism, but less out of touch with the spirit of Catholic Christianity.

The pseudo-Clementine literature consists of three works—one containing twenty \textit{Hermes} another generally known as the \textit{Recognitions}, and preserved in a translation by \textit{Rufinus}; and, thirdly, an \textit{Epitome} of the \textit{Hermes}—a work of little significance, and of great importance, goes under the name of the well-known \textit{Clement} of Rome. The problems connected with this literature are varied and intricate, while the uncertainties associated with it are among the most S. C. H. R. B. of modern scholarship. Indeed, the only statements which may be made with certainty are that the literature is not from the hand of Clement of Rome, and that it is the literature of a Gnostic Ebionite. It may, further, be said that the \textit{Ebionism} is not so stringent as in Elkesaism, and that much greater stress is laid on Christian elements. The pseudo-Clementine \textit{Literature} cannot be ignored by any historian of the early \textit{Christian} Church, though we may rightly refuse to agree with the extravagant claims of \textit{Baur}, and may doubt if it gives such 'brilliant disclosures' (\textit{Hilgenfeld}) as some critics imagine.

The problems connected with the pseudo-Clementine \textit{Literature} may be briefly stated, though a discussion of them cannot find a place here. There is, for one, the problem as to whether the pseudo-Clementine \textit{Literature} or the book of \textit{Ebionites} is the earliest in time. The conclusion accepted generally (though not by \textit{Baur} and \textit{Ritseh}) is that \textit{Ritseh} is the earlier, and \textit{Ebionites} is the later, to the priority of \textit{Ritseh} there is frequently a strong argument, and interlace the latter problem is becomes at once clear when it is seen how the straightforward \textit{Baur}, \textit{Schlizzmann}, \textit{Uhlhorn} (at first), and \textit{Lichfield} give the priority to the \textit{Hermes}; \textit{Ritseh}, \textit{Lehier}, \textit{Hilgenfeld}, and \textit{Salmon}, to the \textit{Recognitions}. If the \textit{Recognitions} is first in point of time, its date may be as early as a. n. 149; if second in point of time, in point of date may be taken as the middle of the 3rd century. On the whole the position may be assumed here that the literature, at least in the present form, belongs to the earlier part of the 3rd century. The trend of opinion is in favour of the view that both the \textit{Hom.} and the \textit{Recov.} are based on a common source, and that the \textit{Epitome} is a further development of the \textit{Hermes}. There is a further problem as to the time of the writer or writers. It is conceded that the \textit{literature} is coloured throughout by \textit{Ebionism}, but it is not clear if it was meant simply as an \textit{Ebionite} propaganda. On this point the various views are as far as the \textit{Christian} world is concerned, to comment on. But the whole, and the \textit{pseudo-Clementine} literature is not the same as the \textit{Christian} world of \textit{Christian} literature. The authors of the pseudo-Clementine \textit{Literature} are not the \textit{Christian} world of \textit{Christian} literature, for the 

When we consider the teaching of the pseudo-Clementine, apart from questions of origin and apart from the literary form in which the teaching is dressed ('\textit{Tendenzroman}'), we cannot fail to observe the \textit{Ebionite} in which the \textit{Literature} is steeped. Certainty its parts are not equally \textit{Ebionite}, for it is plain that in the \textit{Ritseh} alone the \textit{Ebionite} influence is much less marked than in the \textit{Hom.} The writer of the \textit{Recognitions} is, on the one hand, much less \textit{Judaic}, as in its practical ignorance of circumcision; and, on the other, much nearer the Catholic standpoint, as in his rejection of the anti-

animal sacrifices. But, as a whole, the literature presents us with the features already familiar to us in \textit{Christian} \textit{Esoterism}. For instance, with the book of \textit{Ebionites}, the pseudo-Clementines hold substantially the same \textit{Christian} theology. They view the \textit{Christian} law and custom in the same \textit{Christian} standpoint as the rejection of animal sacrifices, in their refusal to accept St. Paul's teaching, in their encouragement of marriage, and in their condemnation and secrecy enjoined on their adherents, they attach themselves to the same \textit{Christian} standpoint. It is a type of thought which is characteristic of the \textit{Esoters} and of \textit{Essene Ebionism} generally.
In the Christology of the pseudo-Clementines, the most striking feature is the doctrine of the True Prophet. If the aim of life is to obtain the highest good, knowledge is essential. God has, indeed, come to man him- self at the beginning, but he has intervened. The True Prophet, therefore, be- comes necessary. He has come again and again. He has come in the seven pillars of the world—Adam, Enoch, Noah, Abraham, Isaac, Jacob, and Moses. Verse 15 states that: Moses, Adam are incarnations of the True Prophet (Hom. ii. 6, iii. 11, 20, 49; Recog. i. 16, 40, 41; cf. Recog. i. 49, "a man over men, who is Christ Jesus"). The Son's humanity and Ebionism there led equally to salvation, for, 'there being one teaching by both, God accepts him who has believed either of these' (Hom. viii. 6). According to the point of Christ's Deity, the pseudo-Clementines consistently hold that: 'Our Lord and Lord neither asserted that there were gods except the Creator of all, nor did He proclaim Himself to be God, but He with reason pronounced blessed him who called Him the Son of that God who has arranged the universe' (Hom. xvi. 15).

Reference has already been made in this article to the brilliant discourses' which Baru and the Tübingen school have found in the pseudo-Clementine literature. With Baru holds a pre-eminent place. The theory of the development of Catholicity, so earnestly advocated by Baru and so candidly abandoned by Ritschl, gives a central place to this literature. Baru's theory was that the early Church was profoundly Ebion- istic; that Christianity and Ebionism there was a very close identity; and 'Jewish Christianity in general was a kind of Ebionism.' (Kirchenrecht. i. 132 [Eng. tr.]). Baru postu- lated a conflict in the early Church between Ebionism, i.e. Jewish Christianity, and Paulinism. Catholicity at the close of the 2nd cent. was intelligible only as the result of a conflict between two opposing forces—Ebionism on the one hand, and Paulinism on the other; and through this conflict the par- ticularism of Judaism (the aristocratical claims of Jewish particularism) (op. cit., p. 113) developed into the universalism of Christian Church. If the conflict was not discernible in the pseudo-Clementines, and in the controversy between Simon Peter and Simon Magnus. The one was a representative of Jewish Ebionism (Ebionism); the other was the repre- sentative of Paulinism (i.e. Gentile Christianity). Simon Magnus was something more than a pseudonym of Paul (op. cit. p. 36). Simon Magnus was nothing but a caricature of the Apostle Paul. Such was Baru's theory, which is needless to criticize. The main thing is to say that such a theory destroys the historical personality of Simon Magnus, who became a representative of pseudo-Clementine; the historical embodiment of all heresy. It is not denied here that this litera- ture, as a whole, rejects St. Paul, and one passage in the Homilies (xvi. 10) has an unmistakable reference to the Apostle of the Gentiles. Nothing else could have been expected from the Ebionites in which the pseudo-Clementines are sounded. Further, it is absolutely clear that Ebionism was something more than Jewish Christianity, and the Ebionites, instead of being co-extensive with Jewish Christianity, were confined to a small area, and had little influence west of Syria.

III. CONCLUSION.—Our inquiry is almost over. The Ebionites as a sect continued into the 5th cent., and is generally disappeared (Theodore, Hebr. 225, Fab. ii. 11). Nothing else could have been looked for. They had taken a false direction, which led them more and more away from the channel in which the Church's life flowed full and free. Catholicism now availed them nothing. They moved further and further away until all progress was barred against them. While the Church's life and doctrine developed into Catholicity, strong and accustomed, the Ebionites, through a long process, were regenerating it; and until its elements were absorbed either in bitter Judaism or in transcendent heathenism. Catholic Christianity gained nothing from Ebionism, un- less in that rugged way which heresy often has of causing the Church to make sure of its ground and to mature its Christology.

LITERATURE.—The ancient authorities are referred to in the course of the article. In modern literature the following are more important in a study of Ebionites: Gieseler, 'Über die Nazarier und Ebioniten' in Stülrwold-Täubers Arch., ii. 2 (1819); Bauer, de Ebionitarum Graecarum (1853), also Kirchengesch. (1853, Eng. tr. 1875), and Vorles., über die ehrubl. Doxogogenesch. (1860—63); Schillings, Die Clementinen und der Hexateuch (1854); Schrader, Die Schriften und dem Ebionites, 1844); Schwegler, Das nach- apok. Zeitwort (1848); Hugenfeld, Das Clement, Reccogniz. and Honenatus (1848); Gieseler, die Ebionitens (1849); Uhlhorn, Die Clementinen and die Reccogniz. (1854); Ritschel, Die Entstehung der altkathol. Kirchengesch., 1866; Recog. of the Development of the Doctrine of the Person of Christ in Eng. tr. (1870); Hagenbach, Dogmengesch. (1886—90); Lightfoot, Cogniz. (1881); Lichthei, Apol. and Post-Apol. Times (Eng. tr. 1886); Schleierm., GZ f. (1886-90); Zahn, Gesch. des NT (1892); Harnack, Doxogogenesch. (1892, Eng. tr. 1894—9); Fisher, History of Christian Doctrine (1896); Kahlen, The Ancient Catholic Church (1892), text. in PRK ("Ebionitien,' 'Ebene- ren,' 'Clementinen'), DCR (1877—80); DOU (1900); also Church State. This would lead to quite an inadequate conception of the subject, for, though Economics includes the management of State resources in such directions as taxation, and is intimately con- nected with State regulation of industrial and commercial activities by factory legislation, tariff policies, land laws, and the like, it considers also the ways in which individuals, groups, and organizations within the State co-ordinate with one another for the purpose of increasing means and administering their resources. As the resources of the community are managed far more by the spontaneous activities of individuals and groups than by the direct intervention of Govern- ments, Economics is concerned chiefly with the former. It inquires how man obtains the goods which satisfy his wants, explains the causes upon which the material well-being of mankind depends, and treats of all activities by which goods are produced, exchanged, and distributed among the individuals and classes of which society is composed. Economics has been described as the science of wealth, but this like most brief definitions, is apt to mislead; and indeed, economists themselves have sometimes carelessly written as if mankind existed for the purpose of increasing the quantity of material wealth. This over-emphasis on one phase of the study was responsible for its being dubbed by Carlyle 'the dismal science,' and for the view still sometimes expressed by the economist, of all men, should most clearly understand that wealth is subservient to a further purpose, and is not in itself the final goal of man's activity. Thus, while in one aspect it is true to

ECLIPSE. See PRODIGIES AND PORTENTS.

ECONOMICS.—1. Connotation of the term.—Economics originally meant the administration of household resources, being the English form of household (cf. La, the book of the Politics, thus defines as household management, including the treatment of slaves. The word 'economy' is, however, now used in a much wider sense, and is applied to the management of all kinds of resources and possessions—the utilization of material goods, of time, of thought, or of labour, in such a manner as to avoid waste. It is not confined to a special de-
say that Economics is the science of wealth, in another, and more important, aspect it is a part of the study of man. Without the economic affording a beneficence of every importance and an increase of the wealth of the citizens was considered a matter for State regulation as a means to the replenishment of the public exchequer and the provision of the sinews of war. Gradually, however, the promoting of the material welfare of the people began to be considered less from the point of view of personal gain and the increase of the finance, a great impetus being given to this movement by the French Physiocrats in the latter half of the 18th cent., who insisted that the network of traditions and the accumulation of the people defeated its own end, and that it was not the business of the statesman to make laws for the increase of wealth, but to discover the laws of Nature which themselves operate for the highest welfare of the people, and to guard these laws from violation and encroachment. Hence to Quesnay (*Droit naturel*, in E. Daire, *Physiocrates*, Paris, 1746) and his followers, Economics became the study of how natural laws worked in an orderly sequence for the establishment of the greatest well-being of the people; and the chief object of the science was the understanding of the conditions imposed by Nature upon human action in the promoting of material welfare. Under this mode of thought, freedom of industry and trade became the dominant doctrine as against the detailed regulation of every branch of economic activity by the State; and in its most extreme form it led to the maxim of *laissez-faire* (q.e.).

The influence of these Physiocratic preconceptions upon Adam Smith was very considerable, for although it is a great exaggeration to say that he was completely under the dominance of the French speculations, he also formulated much of his teaching in terms of the 'system of natural liberty,' and urged that if Nature were only left alone to care for itself much more would be effected than did the method of governmental interference. However defective this view may subsequently have proved (cf. COMPETITION), the immediate result was that Economics became a study of the processes of production, distribution, and exchange of wealth as accomplished by the spontaneous co-operation of men rather than by the action of Governments. Indeed, the revolt from State restraints tended perhaps away from the opposite extreme of non-interference in matters of industry and commerce, save for the provision of the necessary revenue to the public exchequer and the prevention of invasion of the State; and Economics became a social science, and, despite important changes during the last century, it is still more concerned with social than with political or private activities. This by no means implies that economic writings had less effect upon politics; they had more. Pitt, Huskisson, Peel, and Cobden took Adam Smith as their authority in the abolition of restrictions on foreign commerce, on domestic trade, and in the freedom of combination. Ricardo exercised a profound influence upon banking legislation and the abolition of the corn laws; Malthus upon the reform of the poor laws. Nevertheless, in the early stages of the development of Economics as a social science there was a certain narrowness that arose partly from the simplified presuppositions of his consumption, a necessary basis of his activities; but it is only in so far as it becomes subservient to man's interests that it is of importance in economic study.

2. The social and political aspects.—The change of standpoint which accounts for the preference for the broader term 'Economics' is due to the increasing emphasis upon social rather than upon political questions. At first, economic literature was dominantly political, its aim being the attainment of a sound system of public finance, and even the increase of the wealth of the citizens was considered a matter for State regulation as a means to the replenishment of the public exchequer and the provision of the sinews of war. Gradually, however, the promoting of the material welfare of the people began to be considered less from the point of view of personal gain and the increase of the finance, a great impetus being given to this movement by the French Physiocrats in the latter half of the 18th cent., who insisted that the network of traditions and the accumulation of the people defeated its own end, and that it was not the business of the statesman to make laws for the increase of wealth, but to discover the laws of Nature which themselves operate for the highest welfare of the people, and to guard these laws from violation and encroachment. Hence to Quesnay (*Droit naturel*, in E. Daire, *Physiocrates*, Paris, 1746) and his followers, Economics became the study of how natural laws worked in an orderly sequence for the establishment of the greatest well-being of the people; and the chief object of the science was the understanding of the conditions imposed by Nature upon human action in the promoting of material welfare. Under this mode of thought, freedom of industry and trade became the dominant doctrine as against the detailed regulation of every branch of economic activity by the State; and in its most extreme form it led to the maxim of *laissez-faire* (q.e.).

The influence of these Physiocratic preconceptions upon Adam Smith was very considerable, for although it is a great exaggeration to say that he was completely under the dominance of the French speculations, he also formulated much of his teaching in terms of the 'system of natural liberty,' and urged that if Nature were only left alone to care for itself much more would be effected than did the method of governmental interference. However defective this view may subsequently have proved (cf. COMPETITION), the immediate result was that Economics became a study of the processes of production, distribution, and exchange of wealth as accomplished by the spontaneous co-operation of men rather than by the action of Governments. Indeed, the revolt from State restraints tended perhaps away from the opposite extreme of non-interference in matters of industry and commerce, save for the provision of the necessary revenue to the public exchequer and the prevention of invasion of the State; and Economics became a social science, and, despite important changes during the last century, it is still more concerned with social than with political or private activities. This by no means implies that economic writings had less effect upon politics; they had more. Pitt, Huskisson, Peel, and Cobden took Adam Smith as their authority in the abolition of restrictions on foreign commerce, on domestic trade, and in the freedom of combination. Ricardo exercised a profound influence upon banking legislation and the abolition of the corn laws; Malthus upon the reform of the poor laws. Nevertheless, in the early stages of the development of Economics as a social science there was a certain narrowness that arose partly from the simplified presuppositions of his consumption, a necessary basis of his activities; but it is only in so far as it becomes subservient to man's interests that it is of importance in economic study.

3. Relation of Economics to Ethics.—As a social science, Economics is concerned with the intricate and complex actions and motives of man, and therefore it is closely related to Ethics. It is true that it is no part of the function of a positive science to pronounce ethical judgments, but even the positive science cannot neglect the fact that moral considerations often affect man's conduct in business life, thus creating a purely ethical consideration. These judgments, however, must be made in the light of the economics of the age; for the economist is more likely to judge the morality of certain acts than the statistician who will simply record them. Economics, too, has come to be traditionally regarded as concerned with the increase of riches, and there was some warrant for the complaints of Carlyle and Ruskin that, while abundant attention was devoted to the production of wealth, too little thought was given to its distribution in such ways as to improve the condition of the poorer classes. Today there is a perceptible shifting of emphasis from the acquisition of wealth to the distribution of wealth, from production to distribution; and the most recent text-books treat the subject-matter throughout with more reference to the material and moral welfare of humanity. Though his primary business is the scientific study and interpretation of facts, the economist never loses sight of this practical aim of affording guidance for social life and reform.
even a prevalent idea that the two were in conflict, and that an elastic conscience was an economic virtue. Clearly, however, such a sharp division cannot be maintained. It cannot be maintained because all economists are subject to the same continuous ethical influence, whether they are capitalist combinations and trusts adopt immoral practices, or whether the adoption of a protective policy leads to corruption. Still less can the question be put whether there is more equality in the distribution of wealth to the highest welfare, even though it should involve a slight check to wealth production.

The nature of ethical and economic considerations need not lead the economist into the deeper controversies that lie entirely beyond the scope of his science. For his practical purposes the precise meaning of 'the good' is less important than the fact that amoralists of different schools there is a general consensus of opinion regarding the desirability of such and such a change in social life. A problem relating to monetary media or banking practice may present little or no ethical aspect, but labour problems which are claiming an increasing share of public attention cannot be regarded as adequately treated without an analysis of the relevant factors, and those who speak with authority in the name of Economics now fully recognize the necessity for this wider outlook.

Whether, indeed, ethical and economic considerations may come into conflict in particular cases is doubtful. Honesty is not necessarily the best policy for a particular individual from the standpoint of the acquisition of wealth; illustrations to this contrary are too numerous to admit of doubt. But for society as a whole, honesty is an economic as well as a moral virtue. No doubt, too, a community may sometimes gain immediately in material wealth by actions that the moralist would condemn, and it is surely true that an act which marks a moral gain to society may result in immediate material loss. But in the long run it is doubtful whether the conflict can subsist; and, as a rule, if not universally, that which is from the standpoint of society economically injurious is likely to be ethically wrong, while that which is ethically good is likely to be economically advantageous. This consideration suggests that it is quite as important for the moralist to give due weight to the moral forces as it is for the economist to recognize the ethical aspects of social phenomena, that is to say, suffering from greater neglect than the latter.

4. Economic method. — Disputes regarding method at one time threatened to divide economists into different schools, but they have now almost ceased. There is no peculiarly economic method of study, and, though the relative importance of analysis and the search for facts varies with the problem under discussion, each is as ineffective alone as is a single blade of a pair of scissors. The controversies about the inductive and deductive, historical and analytical, concrete and abstract methods have yielded place to a general agreement that every method is correct in proportion to its fruitfulness in solving the particular problem, and that in most cases a combination of methods proves most valuable. Thus, while generalization from historical or statistical data is predominantly employed in most of the problems of production, deduction is relatively more important in dealing with the complexities of distribution or such related matters as the incidence of taxation, with the plurality of causes and intermixture of effects baffle purely inductive treatment. There was unquestionably a tendency among the economists of the first half of the 19th cent. to employ the abstract method too exclusively, and to apply the resulting generalizations too hastily, and the protests of the historical school, combined with the advance of statistical science, have tended to the full appreciation of inductive and comparative tests. Much progress has still to be made in such quantitative analysis before a thorough estimate can be made of the relative strength of various economic forces, but the economists are frequently handicapped on this side by the inadequacy of existing statistical data. Nevertheless, there has been a marked advance in this direction, which might well be illustrated by a comparison of the English Poor Law, 1834, proceeding almost exclusively on a priori methods of reasoning, with the Report of the Royal Commission on the same subject in 1909, in which quantitative analysis plays a much larger part. The same feature is evident in comparing the Free Trade controversy of to-day with that of Cobden's time.

In other directions economic method has been influenced by psychological analysis. Jevons in England, Walras in Switzerland, and Menger in Austria simultaneously worked out a theory of value from the side of demand, on the basis of the psychology of buying and selling factors, and to the older theory that started from the side of cost of production. It supplied the fundamental principles of a theory of consumption. Hitherto the economist has generally been compelled to establish his own psychological principles, since they were not sufficiently prepared for his use by the psychologist; but it seems probable that the future development of Experimental Psychology will have an important bearing upon deductive Economics.

Even more fruitful has been the application of biological conceptions to social and economic life, though their uncritical use has sometimes been mischievous by pushing analogies so far that they become untrue. Formerly economists had attempted to explain man's actions by the categories of Physics, and society was treated as if it were a machine. The interactions of men's wills and motives in economic life were explained in terms of stress and strain, attraction and repulsion. The principle of the composition of forces was thought by J. S. Mill (Autobiography, London, 1873, p. 159 f.) to afford a key to economic method by adding 'the separate effect of one force to the separate effect of the other. But, while this method is frequently useful as a simplification, it generally makes the invalid assumption that economic problems are concerned with external forces operating upon objects which themselves remain unchanged. This was felt to be much too external a conception for a social science. Thus, the effects of an increase of wages in a trade might be studied on the mechanical method by showing how relative wages and profits act as forces attracting or driving away labour and capital; but this would not yield a complete analysis, because the increased wage would tend to affect the efficiency of the worker and possibly of the business organization, so that there is an obvious analogy to functional adaptation in Biology. The step from physical to biological analogies has thus marked a great advance, emphasizing the mutual dependence of the welfare of the whole and the parts, of differentiation and integration, and humanizing economic study. But it has also led to much inaccurate thought, the difference between biological and economic phenomena having frequently been ignored, and the discovery of analogies. The 'struggle for existence' in economic life has been treated in a narrowly individualistic way, and the 'survival of the fittest' has been said to necessitate unex-
ECONOMICS

stricted competition, while it was forgotten that morally inferior men sometimes display greater ability in manipulating that which is derived from the environment, and that many competitors are favoured, while others are irrationally handicapped, before they enter upon the economic struggle. These kinds of biological causes, however, are confined to the minor writers, and intelligently construed biological methods have contributed greatly to economic advance, for the two sciences have a subject-matter which is similar. One of the great secrets of modern science, and weaving them into a connected scientific whole, that the Wealth of Nations (1776) marks as a great departure in Economics as the system of Copernicus was in the study of the universe, and the chief feature of modern industry was lacking, for industrial capital played no large part in production. Public finance and the nature of money certainly occupied the attention of writers of antiquity; but, apart from an occasional anticipation of modern theories, there is little in Greek and Roman literature that has any direct significance for modern economic life. The industrial conditions were not such as to direct attention to the problems which present themselves most acutely at the present day. In medieval times the slave was disappearing before the free labourer, but industry was still on a petty scale. When wages were low, capital was cheap. Economic speculation was intermingled with theological and moral questions—the determination of a just price, usury doctrines, and luxury exemptions. Furthermore that field is of itself little more than a casuistical system of rules for business conduct. After the Reformation, the introduction of printing, the discovery of trade routes to the East, and the influx of precious metals from the New World, there were hundreds of books and pamphlets on economic subjects before the middle of the 18th cent., usually relating to particular controversies connected with monetary matters and foreign trade. As local industrial regulation gave place to national, the Mercantile Theory (cf. Commerce) became dominant, with its demand for freedom of exportation and its doctrine of the balance of trade. There was a great advance in the analysis of problems of production and exchange, but the separation of a wage-earning class and the rise of capital were only beginning to turn attention to problems of both phenomena and foreign trade. It was when the old industrial order was thus passing away and capitalism was in its infancy that Adam Smith's Inquiry into the Nature and Causes of the Wealth of Nations, published in 1776, achieved such success. The name of it is polemenal, being aimed against the imnumerable rules and regulations for the conduct of trade which had lost any justification they may formerly have had in the conditions of the time. The Physiocratic writers in France had already laid stress upon the natural law of freedom before the publication of the Wealth of Nations, but it has now been made clear, by the publication of the notes of his lectures taken by a student, that Adam Smith was teaching very similar ideas in the University of Glasgow as early as 1768 (Lectures on Justice, Police, Revenue, and Arms, delivered in the University of Glasgow, reported by a Student in 1763, and edited by Edwin Cannan, Oxford, 1896). Despite an occasional confusion of economic laws with ethical precepts, which arose from the preconceptions regarding the natural, his exposition of the subject was so forcible and so opportune that it profoundly affected legislation. But the Wealth of Nations also contained a scientific treatment of society on value and profit of wealth, and here the French economists had anticipated him and exercised a strong influence upon him. Target, in his Réflexions sur la formation et la distribution des richesses (1770; Eng. tr. edited by W. J. Ashley, New York, 1888), gave a
theory of wages, profits, interest, and rent which was largely coloured by the Physiocratic doctrine that agriculture alone yielded a net product over the expenses of production, while manufacture merely changed the shape of materials already productive, which was involved in the process with the useful materials consumed by the artisans during the period of labour; and commerce merely changed the place of materials without increasing the wealth of the society. The theory of distribution received fuller development at the hands of Adam Smith, and, though he did not accept the view that agriculture alone was productive, but extended the conception to manufacture, he established the economic theory that:

* "In agriculture nature labours along with man; and, though his labours do no more than his nature does, yet, if man has any skill or enterprise, he can increase both the quantity and quality of his productions." 

The assumption and the conclusion to be that land yields a surplus in the shape of rent in addition to wages and profits; yet this fact is not due to the greater bounty of Nature in work on the soil than in other industrial pursuits, but rather to the calculations and variations of that bounty. Now, when natural forces have been exploited on a large scale for manufacturing and mercantile purposes, it is futile to ask whether Nature contributes more to production on the land than to other forms of production. The main doctrines of Smith regarding the distribution of wealth did not differ essentially from those of Turgot, though he departed further from the Physiocratic theory and gave more emphasis to the industrial, as distinguished from the agricultural, system. Francis Hutcheson, Hume, Steuart, and other English writers had also made important contributions to the economic theory before 1776, but, as Marshall (Principles of Economics, London, 1907, 1. 575) says, "Adam Smith's name was so vast and resound that all that was best in all his contemporaries, French and English; and, though he undeniably borrowed much from others, yet, the more one compares him with those who went before and those who came after him, the finer does his genius appear, the broader his knowledge, the more well-balanced his judgment. Wherever he differs from his predecessors, he is more nearly right than they; while there is scarcely an economic truth now known of which he did not get some glimpse. And, since he was the first to write a treatise on wealth in all its chief social aspects, it was to him that Hegel, Digges, and others, have returned to be regarded as the founder of modern economics." His highest claim to have made an epoch in thought, according to the same writer, was to have made the first step in a careful and scientific inquiry into the manner in which value measures human motive—a theory which gave a common centre and unity to the science.

The Industrial Revolution, which was only beginning in Adam Smith's time, soon proceeded apace, for Watt discovered the steam-engine in the same year that the Wealth of Nations was published. New problems arose as the factory system superseded the domestic system of production in England, especially far in advance of any other nation, the discussion of them took place chiefly in that country. In the hands of Ricardo and Malthus, therefore, the development and extension of Adam Smith's principles had the directly practical aim of contributing towards the solution of the special problems of the early years of the 19th cent., and this work they did very effectively. Freedom of trade was now more firmly established as a principle, and the conditions of distribution became more acute with the growth of the business unit and the increased number of wage-earners, so that the relation of wages to profit was a subject of intense discussion. The condition of the poor and the influence of the poor-laws were in the contributions of Malthus; the effects of the restrictions upon importation of corn led to an elucidation of the theory and nature of rent; while the financial difficulties of the period of the French war and the suspension of specie payment by the Bank of England caused a development in monetary theory. The Malthusian theory seemed to warrant the view that the poor condition of the labouring classes was due to the fact that when wages rose above the level of subsistence there was a tendency for population to increase and force them down again, and this view in one way by his theory of rent, which showed the tendency to diminishing returns from increased applications of labour to land, and also that the surplus produce above the margin of cultivation went to the owners of the soil. By a careless expression to the effect that wages could not rise above the level of necessities he also provided the basis for the Socialist doctrine which represented the margin of cultivation as the margin of necessary wages, generalized it to the whole of industrial life, and held that capitalists and landowners swept off all surplus produce.

7. Recent development—Recent economic doctrine has been mainly an amplification and modification of that which flourished in England under Ricardo, Malthus, Macaulay, and Mill. But, since the middle of the 19th cent., other countries have been overtaking England in industrial development, and have been contributing ideas to the development of economic thought. Prior to that time France and England were almost the only countries which had contributed anything of importance, but during the last half-century American, German, Austrian, and other writers have applied themselves to the science with such skill and success that they have added it much of its former insecurity and added to its outlook. The increased concentration of capital and the immense growth of commerce, following upon improvements in railways and steamships, have brought about larger conditions, so that problems of transport, international trade, monopoly, and speculation have assumed a larger place in economic treatises. The doctrine of non-interference has been more generally accepted, and the latest phase of this movement of thought, which promises to be the most important for some time to come, is the application of the doctrine of competition to the solution of social and economic problems, and has been the object of the theory of the distribution of wealth and the realization of the tendency of wealth to bequeath to the science.

The subject of distribution of wealth is claiming fuller investigation, and the desire for raising the economic condition of the less fortunate members of the community is tending to overshadow all minor controversies. The economists of the first half of the 19th cent. treated distribution from the standpoint rather of abstract classes like capitalists and labourers than of individuals, and did admirable work in explaining the nature and variations of each category of income—rent, profits, and wages. But to-day the emphasis of popular discussion is upon the great inequalities of income which arise largely from inequalities of inherited property and inequalities of opportunity, and economic inquiry has tended to follow the same direction. Consequently, greater stress has been laid upon the fact that the increase of aggregate wealth is not necessarily accompanied by increased material well-being; and, through the work of Jeunon and the Austrian school, the theory of value has been re-stated from the side of consumption and utility in order to show that the conclusions from the theory of value can fall into the common error of earlier authorities of confounding the two conceptions. It is now of fundamental importance, not only in general
economic theory but also in its application to the principles of taxation and socialistic proposals, to reconcile people in the fact that the relative urgency of wants depends largely upon the extent to which they have already been satisfied, so that it cannot be a matter of indifference in what form he gets his share of a particular quantity of material goods accrues to the rich or to the poor. No doubt recent economists in elaborating this profoundly significant principle have sometimes attempted to give it an air of precision which it cannot sustain, and such calculations of pleasure or utility are apt to raise the suspicions of the philosopher. But, while it is impossible to give absolute proof that a particular poor man suffers more from the loss of a shilling than does a particular rich man, and it may even be quite untrue in special cases, yet in dealing with large numbers any scruple regarding the matter vanishes, for no one would find much comfort in the fact that the income of material wealth was the same whether a million sterling went to the working-classes or to the payers of super-tax. The earlier economists, perfectly fair in interpreting the doctrine of the 'wages-fund,' partly from lack of an adequate theory of demand and consumption, usually thought that if a policy increased or diminished what is now called the 'national dividend,'—the quantity of goods produced in a year,—it was ipso facto good or bad, economical or wasteful. But the principle that the utility of a good depends upon the quantity possessed makes it clear that even a policy which injures the national dividend may yet promote material welfare if it modifies the distribution of wealth to the advantage of the latter. Hence among economists, as well as by socialists, a more even distribution of wealth is considered to be desirable, and modern controversy turns rather upon the advisability of particular methods of achieving it, and upon the magnitude of their effects on productive efficiency and the like, than upon the desirability of the end. This conception of utility or psychic significance has affected not only the standpoint from which the distribution of wealth is regarded, but also many of the results of the principles of material wealth. The fuller recognition of the distinction between material wealth and material welfare has made it necessary to take account of the disability involved in their effects on productive efficiency and the like, than upon the desirability of the end.

8. Problems of Economics.—A summary of all the various subjects that are treated in a textbook on Economics would yield but a dry table of contents. What is here proposed is rather to explain, without unnecessary technicalities, the essential features of the science at its present stage of development, dealing first with the more general principles upon which the subject depends, and secondly with their application to particular policies for the furtherance of material welfare through the action of the State. (a) The primary requisites of material welfare are labour and natural agents; without the cooperation of these no production of any kind is possible. In a secondary place come capital and organization—meaning by 'secondary' not that they are less important in the process of production as now carried on, but that production of some sort is possible without them and they become important at a later stage of industrial development. Labour cannot create material things; but, by operating upon the materials which Nature gives, changing their form, place, or qualities, it adapts them to man's needs. In Nature there is remarkably little suitable for human provision until it
has thus been re-made according to man's own plan. In the last part of the 18th century this adaptation, which is called the production process, had to be performed almost wholly by man's muscular force aided by that of domesticated animals. There were tools, but, the motive-power being muscular, their range of operation was definitely limited by the physical and nervous energy of man. In a very few directions, which now seem by comparison almost negligible, the earlier period had attempted to progress beyond the merely muscular, as in utilizing the wind for ocean traffic and for small mills; but since the advent of the age of inventions we have looked more to the intelligence of man curbing and directing the forces of Nature in such forms as steam and electricity to perform most of the heavier work.

This perfecting of the agencies of production, which is still proceeding rapidly, removes the former limit of physical endurance, and the only bounds to the increase of material power are the far-distant one when all natural forces shall have been economically explored, and the improbable one that man's inventive capacity will come to a halt. This rapid adaptation of the world to man's requirements, by which natural forces are made to work for us, should, if rightly directed, result in a much higher and indeed in a community not only more, but higher, than that of which the future of the aggregate output of goods; these are only instruments that may contribute much or little to welfare and to the raising of the standard of living according to the manner in which they are divided and utilized, and to the number of people embraced in the community. As man's wants are never fully satisfied, or likely to be, the first principle of production is that a people should strive to obtain the goods it requires with the minimum expenditure of effort. This is sometimes questioned by those who are painfully conscious of the fact that people are often to be found who have no work to do, and projects for 'making work' are sometimes advocated. Yet there can be no such thing as a general scarcity of work until mankind is supplied with everything it desires. Defective organization of industry shows itself in maladjustments of the labour force between different trades; in the inability to predict with certainty the future supply of raw produce or food, and the changes and fluctuations in prices; in the spasms and reactions of credit, as well as in the temporary displacements that accompany all progress and change. Such causes as these tend to unemployment, but the most lack of work to be done, and it is wasteful to spend more effort upon making any class of goods than is absolutely necessary.

The effectiveness of labour in production is greatly increased by the advance of science, which teaches men how to make the most of the natural environment by applications of chemical and physical discoveries, and by the general rising of the level of skill and intelligence. It is also increased by the fact that the stock of appliances for production is growing faster than the population, so that every generation bequeaths to its successor much larger quantity of the products of past effort, in the shape of machinery and other forms of capital, than it received from the preceding generation. And the effectiveness of labour depends, too, upon the conditions under which it operates. Thus the separation of employment and division of labour, allowing each to perform the work for which he is most suited by nature or training; through the combination of labour, which can perform what would be quite impossible to any single individual; through the localization of industries in the places best suited to the purpose; the 18th century, and the 20th century, man can weave more cloth in a day than ever before; while the second can produce more better boots than the first, the productivity of their labour will be increased when they specialize their work and exchange their products. Similarly, if, for climatic or other reasons, one district can produce cotton goods more easily than another, while the second can produce coal or granite more easily than the first, it is economical that the districts should specialize their production and exchange their products. Indeed, even if a man possessed such excellent abilities that he could do a dozen things better than most other people, he would still be most beneficial to production that he should devote himself to the occupation in which his superiority was most marked, for it is not economical for a successful lawyer to do his own typewriting, even though, with practice, he might be able to do it expertly.

These commonplace ideas are seldom directly denied, but it is often forgotten that they are not changed by political boundary lines and lines of latitude, and that the advantages of territorial division of labour are not essentially different in comparing two nations from what they are in comparing two towns or counties. If, by hindrances to exchange, a community is prevented from producing the goods in which it has little or no superiority, it must make fewer of the goods in which its relative superiority is great; and such hindrances, by impeding the territorial division of labour, lower the productivity of industry. No doubt there are some incidental disadvantages in all forms of localization of industry, as there certainly are when one labour becomes so specialized that it cannot readily be readjusted to the amount of it in different lines of production as the demand changes; but on the whole the productivity of industry increases when the localization of industry is unimpeded, for much the same reasons as when each man is performing the work for which he has the highest aptitude.

It follows from this conception of localization that the effectiveness of labour depends upon the condition of the land or other natural agents with which it operates. Different areas are very unequally fitted for assisting labour, because of their variations of fertility, climate, geological formation, or geographical position; and, though some of these conditions are sometimes affected by man's action through the incorporation of capital with the soil, others admit of no great modification. In any case, the labour required for producing a given quantity of goods in a favourable locality is less than in an unfavourable one, so that labour is more productive when applied under the former circumstances than under the latter. This gives rise to variations of rent, for those who control the superior sources will naturally reap higher gains than those who control the inferior. Besides variations in natural endowments affecting the productivity of labour applied to land, it is also affected by the response that land makes to intensive cultivation, so that there was at one time a fear that the number of people would increase to such a point that the supply of food and other products of the land would not keep pace with the growth of population. In other words, the effectiveness of labour depends upon the amount of land available, for after a certain point, as the number of people increases, less land can be cultivated, so that the return per man is lower and lower return of produce to the successive increments of labour, unless changes have meantime occurred in the arts of agriculture. If it were not so, there would be no limit to the intensity of the cultivation that could be profitably carried on. The earlier economists may have given too
little weight to the possible improvements in agricultural methods, facilities of transport from abroad, and the like; but it remains true that, if population increases rapidly, the deficiency in these things, as well as in other products of nature, will result in high prices and scarcity, and whatever is not included in the production of a good we possess, the lower is the significance to us of any further addition to the stock of it, until, when superfluity is reached, no satisfaction is dependent upon any one item of the good, and therefore its cost falls to the value of the air. There can be no value in the absence of utility, and the value of any good depends upon the marginal utility—that is, upon the utility of the final increment of the commodity which we are just induced to purchase. Cf. art. CONSUMPTION.

Thus, the nearer the quantity of the commodity approaches to the amount required for complete satisfaction of the wants dependent upon it, the higher will be the marginal utility and the lower the value of any single increment of it. Hence it may be briefly stated that, other things being equal, the demand price of a commodity decreases with every increase of satisfaction, and vice versa.

If the money price of a commodity increases, it is because the price of the commodity price has increased, and because the rate of money interest is high. If the demand price of a commodity increases, it is because the rate of money interest is low, and because the demand for the commodity has increased. If the supply of a commodity increases, it is because the rate of money interest is low, and because the demand for the commodity has decreased. If the demand price of a commodity decreases, it is because the rate of money interest is high, and because the demand for the commodity has decreased. If the demand price of a commodity decreases, it is because the rate of money interest is low, and because the demand for the commodity has increased.

(c) The problem of the distribution of income in the form of wages, rent, interest, and profits is an illustration of the principles of value. The relative incomes of different people depend upon the value of the produce of their labour and the value of the use of their property, so that a full explanation of the fact of widespread differences of income would involve a statement of all the reasons why some one owns more property than others, why some laborer produces a higher return than others, and why different forms of exertion, from unskilled labour to the organization of a huge industry, are so variously valued. This can only be here illustrated in the same way that a price is determined in a market. In the first case the price is determined by the value of the need for the good, in the second case by the value of the use of the property.
paid not for any work that they personally perform, but for the service of factors of production which they own. The magnitude of incomes from the possession of such property depends upon the amount and the efficiency of the property possessed, and these again depend upon individual providence, judicious choice of investment, and the amount of remuneration, as well as upon the magnitude of the individual's earnings, which largely determine the possibility of saving. Within any one class of property incomes there are very wide differences, no more than another of equal size, because of its superior situation, natural endowments, and the improvements made upon it by expenditure of capital and labour in the past; one use of capital yields a higher income than another because the different uses to which capital is put vary in their productiveness, in their security, and in their marketability; and people are willing to accept a lower return on an investment which has a high security and is easily marketed. Similarly, the wages of labour depend upon the value which the public attaches to the goods or services produced by it, and the consequent demand for workers ready to perform the tasks. In each trade the wages will be fixed by the value of the product of the marginal worker—the worker, that is, whose presence will make the greatest possible difference to the employer. If the number of labourers increases while other things remain the same, the remuneration of each will be lowered, because the value of the marginal product will fall as more of it is placed upon the market, unless the industry happens to be one in which the addition of workers makes production so much more efficient that the increased output per head is more than sufficient to counterbalance the fall in the price of each unit of produce. In this way it emerges that the importance of an occupation to society is no test of the wages that will be paid in it, any more than the relative value of corn, air, and diamonds is explained by their importance to human well-being. Precisely as goods rise in value if there are few in the market when many are wanted, so the value of a particular kind of labour rises when there are few labourers in comparison with the demand for their work. Hence the reason why wages in one trade are higher than in another depends upon the number of people and the demand for the work of each. As wages are equal and all trades equally desirable, there could be no such differences of wages. But not only do occupations vary in the advantages, other than money wages, which they afford; the workers are also differentiated into classes who can rarely do each other's work, and the main reasons for the relative over-supply of labour in some occupations as compared with others are therefore to be sought in the circumstances that render labour immobile, and that prevent workers from entering the more highly paid trades. For some temporary reason, such as a change in the nature of demand, too many people may have become specialized to a particular trade and too few to another, but the error cannot be quickly rectified, because of the time required to train new workers. In the course of time it may be expected that the higher wages will attract to the one occupation, and the lower wages will repel workers from the other; but in the meantime the maladjustment of the labour force between the trades will cause a corresponding variation in the value of wages.

Of more permanent and serious import is the fact that the choice of a trade is not free. The people become distributed between different occupations in a rather arbitrary manner, and it would promote welfare if more people followed some, and fewer other occupations than at present. Since many employments call for lengthy and expensive training, the children of parents who are both willing and able to undertake this preliminary expenditure for their children, whether the supply of labour of that kind will be great or small. The chief reason why the kinds of work that any one person can perform are at present paid for on a very low or miserable scale is that there is a very large number of parents who either have not the power or have not the will to bear the expenses required for higher industries. Customs of various kinds also limit the freedom of choice in some cases, and this is particularly important in fixing women's wages, for women are by custom excluded from many employments, and so relatively overcrowd others. The difficulty of gauging in advance the comparative advantages of employments when conditions are rapidly changing, the differences of physique and mental strength, also give rise to differences of wages from trade to trade, where the last-mentioned factor also causes variations of earnings within the same trade.

Besides competition of workers and the relative supply of them in different trades, there is still another factor tending to fix the limits of wages, viz. the principle of substitution. Men compete with one another in persons, with machines in production, and with capital and other combinations. It is the employer's function and interest to keep down the expenses of production by choosing those factors and groupings which are most economical. Thus land, labour, and capital are all needed in farming, and no one of them can be wholly substituted for the others; but they can be substituted for one another at their margins. The farmer may conceivably give up a man area with more labour but less machinery or manure, with less labour and more machinery or manure; or he may produce the same crop from a smaller area of land at still further increasing the labour and machinery. Land, labour, and capital are here being balanced against one another as factors of production, and, if the price of one rises considerably, the others may be chosen to take its place in some measure. So it is in every industry. Each factor and sub-factor, however necessary to production, may find a substitute at the margin in some other factor or sub-factor; and in this fact for their cost there is found a ready explanation of the short-sighted and misleading saying that 'most men earn just about what they are worth,' that being calculated as their economic factor-worth. The wages in a trade tend to equal the marginal worth of the labour in that trade, and that marginal worth is fixed both by the number of workers in the occupation relatively to the demand for their produce and by the competition of other factors capable of performing similar work. Unfortunately, however, the saying just quoted is often used to support the very different idea that a man's income measures his personal efficiency. That is by no means justified by economic analysis. Through the method of substitution the portion of the aggregate produce of the community which goes to remunerate any particular agent or factor of production tends to be adjusted to the efficiency of that factor in supplying the wants of mankind, so that distribution depends upon factor-worth. But, besides labour and organizing ability, capital and land are factors of production; and, though these earn in proportion to their contribution to the wealth of the community, they cannot be said to acquire incomes; their owners receive the reward whether personally efficient or the reverse. Moreover, the theory of distribution takes the wants of mankind as they are, not as they ought to be; so that, if the popular demand
requires successive editions of a sensational novel, while a book embodying the profound researches of the scholar will not sell, the author of the former being more efficient in supplying the wants of mankind, and accordingly obtains a greater share of income. In a deeper sense, no doubt, a man may be so very efficient that the people are unable to appreciate his wares; but that is only to illustrate that intellectual men do not, as such, constitute a claim upon the national dividend under existing conditions.

8. State action for the promotion of material welfare.—After this survey of the general principles, it remains to exemplify their application to particular proposals for State action in furtherance of material welfare. This section cannot pretend to systematic completeness, and selection can only be made of two samples from the multiplicity of projects and activities. The subjects chosen as sufficiently representative and widely debated are the raising of the economic condition of the worst-paid and the suppressing of exploitation for the protection of home industries.

(a) The problem of very low earnings.—The subject of low earnings connects itself with the general principles of wages already enunciated. The tendency of a great deal of wage control, in fact, is to pay to workers their marginal worth in the particular trade. Clearly they cannot permanently get more than this, because, if the marginal worth of a class of men were 20s. a week while the wages were 21s., it would be to the advantage of an employer to dismiss men up to the point at which the gain resulting from a further dismissal would be equalled by the loss. On the other hand, competition for labour among employers should normally prevent wages from falling below the marginal worth of the labour.

Hence, when a large class of work-people is found to obtain very low earnings, two questions arise to the mind of the economist: Are the low wages to be accounted for by the low marginal worth in that occupation, or are they due to special circumstances which prevent properly in the trade in question? more briefly, Are the workers not obtaining as much as their marginal worth? In some cases both questions may admit of an affirmative answer. Thus, in the case of sweated home-work among women, the supply of labour relatively to the demand for it is very high, so that its marginal worth is low. Much of the work is of a kind that can be performed by machinery in factories, and the cost of production in the factory fixes a limit to the wages that can be paid in the home. Many of the articles may be made by the consumers themselves, and, if their price rises, this method of production will be stimulated. There is thus an excessive supply and a limited demand, and these facts alone warrant the conclusion that the marginal worth of the labour must be low. But in the same time there are also reasons for believing that the wages, in some cases at least, fall below the marginal worth, because the bargaining power of the home-workers is very weak; they know little of one another, and cannot take collective action in resisting a fall of wages. So far the conditions of a true market are absent, and in practice different piece-rates are sometimes paid for precisely the same work by different employers. It is in the fact that the institution of minimum wages by law for such industries may be expected to have a good effect; for, if the home-workers were already in all cases retaining their marginal worth, any raising of the wages of one class above those of them, unless, indeed, their worth immediately rose in proportion to their higher wages. But in the case of unskilled men there is little reason to believe that the payment of wages below their marginal worth is very common or important. The main cause of this is that the marginal worth is low on account of the magnitude of the supply of such labour relatively to the demand for it. The idea that the prescription of a minimum wage by law will in such circumstances suffice to eliminate the evil cannot be sustained, for it is impossible to force employers to give more for labour than it is worth, and a man is not worth more simply because the Government declares that he must not be employed for less than a given sum. The result of a minimum wage in these circumstances must be to throw a large number of men out of work altogether. Conceivably this may be desirable as an incident in a larger scheme of reform where the gain is more than sufficient to counterbalance this loss, but the legislative prescription of a minimum wage alone is no remedy. Far more hope lies in an attempt to make the wages of the worth more truly reflect the value of the members of the overcrowded class to a higher level of efficiency, or by checking the degradation of members of the higher grades. The economic reason for the deplorable state of things is that there is a market for them, and the best course to pursue is to rectify this, for economic forces will then work with us in raising the wages of the poorer classes. This means that some of the sources of the over-supply of such labour must be stopped up, and in particular that at the adolescent age boys must be trained to fill some positive function in industrial life, instead of being allowed to drift into any uneducative job that offers good wages at the moment but leads to nothing in the future.

A serious objection is frequently raised to this course by the skilled workman, who asserts that the drafting of boys from unskilled and casual to skilled and regular trades can do no real good, because the skilled trades are already over-stocked; and a number of anti-social policies by Trade Unions and others have been dictated by this view. It arises largely from the practice of thinking about values and wages only in terms of money; as soon as one goes behind the money expressions, it is seen to be fallacious. The bootmaker's objection to the training of more boys for his trade, instead of allowing them to drift into casual and unskilled labour, is that the want he exists to satisfy will be more fully met while the man is making it, and the labourer will be more fully met, so that society gives him less of general commodities for a week's work than before. The objection would be partially valid if all the boys were diverted into this one skilled trade, though it might still be said that, when a set of men who would otherwise be doing little work, or casual work of very low worth, are making boots that are much needed instead, society as a whole will be enriched by the change, despite the fact that the price of boots and the wages of boot operatives would fall. But it is not proposed to draft all the boys into any single skilled industry; they would be distributed over industries of all kinds, so that all wants would be somewhat less painfully met in due proportion. Then, despite the fact that boots are rather less urgently required than before when the supply increases, the bootmaker will not suffer because the supply of this latter is in exchange for boots. The only qualification to this is that by withdrawing labour to a large extent from casual occupations the price of such unskilled labour would rise, and, unless it increased in efficiency fully to correspond, or unless there was no progress and invention in the work performed by the unskilled, their produce would rise in price.
and they would be relatively favoured by obtaining a
greater command of general commodities for each
unit of their labour. But in any case the economist
will be able to make real
wages more equal as between skilled and unskilled
trades by raising the earnings of the latter, and
welfare is thereby promoted. The function of
State action in this matter is, therefore, to carry
its educational policy further into the more ade-
quately training of youths, the suppression and
regulation of undesirable forms of boy labour, and
the more thorough direction of the labour force into
its proper industries by the diffusion of information regarding occupations and the like.
In such ways it can raise the marginal worth of
the workers in unskilled trades, by reducing the
supply and by raising the efficiency, so that eco-
nomic forces themselves will then raise the wages.
The State may also bring pressure to bear upon
employers in order to regulate work as far as
possible, instead of offering it in a casual fashion,
and this will likewise tend to diminish the supply,
as will people see that the chances of picking up a
living by odd jobs are reduced, and they will have
a stronger inducement to prepare themselves and
their children for regular work. The suspicion
means that the State can employ for improving the
position of the poorest classes are those which
directly or indirectly increase the efficiency of
the workers, and distribute them more evenly among
different trades in comparison with the demand,
so that their marginal worth is at least sufficiently
high to give them command over the necessary
for decent living.

(b) Free trade and Protection.—The object of
foreign trade is to render it possible for the people
of a country to obtain goods more easily than they
could otherwise do. That exchange is a gain to
both parties, and that it realizes the economies of
division of labour and localization of industries,
is always admitted in regard to domestic trade;
consequently no one questions the advantages of a
policy of free exchange within the limits of a
single country. The doctrine of freedom in inter-
national trade rests upon the same elementary
facts. If each nation devotes its resources to those
forms of production for which it has a relative
superiority, and exchanges such goods for those
which it cannot produce with equal facility, the
income of its people will be higher than if they
were compelled to produce for themselves all the
goods normally within their jurisdiction. The idea
that one country gains at the expense of another
is absurd, and a country that will not buy cannot
sell. Hence impediments to trade diminish the
productivity of labour and capital within the pro-
tected area by nullifying the advantages of terri-
torial division of labour. There is a prima facie
presumption that it pays Britain better to produce
the goods she is producing and exporting rather
than to divert some of her productive forces from
these to making the goods she is now importing.
The burden of proof, therefore, lies upon the
protectionists to demonstrate the falsity of this simple
general principle, or its inapplicability to some
particular circumstances. Broadly, protectionist
arguments may be divided into two classes: those
which urge that impediments to trade will increase
the wealth, employment, or productivity of the
country imposing them; and those which appeal
to wider considerations such as national defence
or imperial sentiment.
The oldest and the crudest of the arguments
arose on the ground that foreign trade benefits
a nation only when the value of the exports exceeds
that of the imports, because it is then supposed
that the difference must come in gold and so enrich
the country. The refutation of the argument is
manifold. The excess of imports or of exports is
usually fairly explicable without the passing of
gold, by taking account of such items as shipping
services and insurance: it makes real
wages more equal as between skilled and unskilled
trades by raising the earnings of the latter, and
welfare is thereby promoted. The function of
State action in this matter is, therefore, to carry
its educational policy further into the more ade-
quately training of youths, the suppression and
regulation of undesirable forms of boy labour, and
the more thorough direction of the labour force into
its proper industries by the diffusion of information regarding occupations and the like.
In such ways it can raise the marginal worth of
the workers in unskilled trades, by reducing the
supply and by raising the efficiency, so that eco-
nomic forces themselves will then raise the wages.
The State may also bring pressure to bear upon
employers in order to regulate work as far as
possible, instead of offering it in a casual fashion,
and this will likewise tend to diminish the supply,
as will people see that the chances of picking up a
living by odd jobs are reduced, and they will have
a stronger inducement to prepare themselves and
their children for regular work. The suspicion
means that the State can employ for improving the
position of the poorest classes are those which
directly or indirectly increase the efficiency of
the workers, and distribute them more evenly among
different trades in comparison with the demand,
so that their marginal worth is at least sufficiently
high to give them command over the necessary
for decent living.

The argument upon which the greatest stress is
generally placed is the benefit of protection to the
working classes by increasing the quantity of
employment of wages. For this various reasons
are assigned. The first consists in resisting
the specific instances in which a trade could be made
employ more people if the competing foreign
goods were excluded. But the free trader has
never denied this. It is upon the second point,
particular industry may be contracted by allowing
imports to compete with it, and charges the
protectionist with the fallacy of ignoratio elenchi.
The position of the free trader is that those in-
dustries that would gain by a tariff would do so at
the expense of a greater aggregate loss to other
trades by diverting productive forces from more to
less remunerative channels. In political campaigns,
however, this argument for protection is one of the
most effective. It appeals to the economic truth
that it is to my interest that the goods I make
should be scarcer while everything else is plentiful,
and if a tariff will bring about that state of things
I shall gain. But, as soon as the promise of making
goods scarce by a tariff ceases to be confined to a
particular trade and is generalized to all trades, it
becomes flagrantly absurd.
Another form of the same method of argument
is to point to the effects of a tariff in leading to the
investment of capital—sometimes foreign capital
—in the protected industry. Even granting that
these effects would always likely to become like
a tariff, it does not follow that protection has
attracted more capital to the industries of the
country as a whole. On the contrary, it causes a
diversion of capital to an equal or greater extent
from other trades which are directly and indirectly injured.

A different kind of argument in support of the protectionist view is that workmen in particular may be benefited by such a tariff as would exclude manufactured goods while permitting importation of commodities which the protectionist regards as raw materials. The argument is that the existence of a tariff prevents further development of industry and its protectionist believes that the resulting protection is more important in the former than in the latter. Quite apart from the difficulty of distinguishing raw materials from manufactures in a state of industry, protection and free trade becomes the raw material of another, the argument appears to rest on a confusion of thought. More labour has, of course, gone to the production of a ton of steel than to the production of a ton of coal; but, then, nobody exchanges a ton of the one for a ton of the other. The question is whether labour has played a greater part in producing £100 worth of steel than in producing £100 worth of coal, and, in point of fact a higher proportion of the value of coal goes to remunerate labour than in the case of steel. The comparison of values alone is relevant here; and, value for value, it is not the case that manufactured goods embody more labour than raw materials.

The most recent plea under this head is that protection might steady employment by lessening the fluctuations of industry. Statistical comparison of the employment situation is too difficult to make at present, and, even if it were not so, it would fail to be convincing, because at most the fiscal policy can be but one among many factors influencing the intensity or recurrence of depressions of trade. The protectionist, however, asserts that the ‘dumping’ of surplus goods by foreign countries into a free trade country at very low prices is a cause of instability. Cf. art. Competition. That the dumping of goods by foreign trusts and cartels has been greatly exaggerated, but they do occur, and on the one side is the gain to the industries that use the cheap imports, which are almost always half-finished goods, while on the other side is the injury to the industries with which the dumped goods compete. The free trader tends to emphasize the former, the protectionist the latter, but the net gain or loss to the importing country depends on the circumstances of the particular time at which the dumping takes place. It is possible that on the whole the loss may predominate, inasmuch as dumping is intermittent; if in a country A, the tariff which is to be imposed in country B is greater. But the burden lies upon the protectionist to show that a tariff would cure the evil by preventing any unsteadiness of employment that it may occasion, and he is apt rather to take this for granted than to prove it. It is quite untrue to say that a free trade country alone is subject to dumping, for similar complaints have been frequently made in protected areas. Moreover, if the price of the goods in a protected country is higher by about the amount of the tariff than in a free trade country, there is no more inducement to dump into the latter than into the former. Indeed, if a country A habitually sends goods of a certain class to B, a free trade country, and to C, a country with a ten per cent tariff, and A now finds itself with a temporary surplus to get rid of without lowering prices at home, dumping will be slightly easier into C than into B, because in C the tax per ton falls as the price falls, and so stimulates sales the more. Further, low protection of about ten per cent, which is all that the Tariff Reform Commission has recommended, would not check dumping, because, on the authority of that unofficial Commission itself, the dumping prices are already dropped by a much larger percentage. Very high protection that stopped imports of that class altogether would, of course, prevent dumping; but, so far from securing stability of employment, it would increase instability by allowing new fluctuations which free trade prevents. It is a steady influence that, when the price of iron in a free trade country falls, importation is checked, and when the price rises more is sent. If this influence is not a permanent one, and the industry dependent upon iron will be subject to greater disorganization and fluctuation of employment, so that a tariff sufficiently high to prevent dumping would create much worse economic instability, one would isolate apart from the other injuries of high protection.

The wages argument, especially in the United States, takes the form of ascribing high wages to the tariff, and appeals for the exclusion or taxation of the products of low-waged European labour. That some fallacy is here involved is suggested by the facts that the countries with low wages are among those which adopt protection, and indeed sometimes urge the necessity for tariff aid against their highly paid competitors, and that no country in the world has ever differentiated in its tariff by favouring imports from countries where wages are high as against those from countries where wages are low. The argument does not take into account the difference between money wages and real wages, and generally in a protected country the cost of living is relatively high. Also, low wages do not mean low cost of production. High wages are found, the output per worker is at least as high in proportion. The true economic relation has thus been inverted. High real wages are due to the higher productivity of labour, and that in turn depends chiefly on the superior natural resources of a country, the efficiency of its workers, and its business organization. It also depends upon foreign trade to the extent that productivity is increased by the competition of foreign goods. When high wages are found, the output per worker is at least as high as the former. In fine, wages are dependent on the effectiveness of labour; and, since the artificial inducement of industries in which labour is not sufficiently effective to render them profitable without a tariff results in lowering the general effectiveness of the labour force of the country, the average level of real wages will be thereby reduced.

It is occasionally proposed that a nation should adopt free trade only towards the countries granting to it the same privilege. In so far as this arises from the belief that trade must be free on both sides if it is to benefit both, it is fallacious; but, in so far as it is based on the view that a tariff may be used for purposes of bargaining, and thus may lesser or remove foreign restrictions, it was admitted by Adam Smith as a possible exception to the general free trade doctrine. It involves immediate loss in the hope of future compensation through freer trade. Its validity depends on the probability of success, as it can be justified only when it removes the hindrances to trade; and in estimating this probability the nature and conditions of the export and import trade of the particular country must be considered. Experience has generally shown that retaliation creates animosities which lead to still higher protection, so that a balance of injury commonly results to the country using the weapon as well as to those retaliated upon. It may be worth noting that, even though much wealth of the nation is diminished by protection, this loss may be offset by political considerations, increased national security, or the like. Such considerations were at one time used in support of the laws and Navigation Acts in the United States, and the particular ease can be treated only on its own merits. On general grounds it may be said, however, that, while a loss to the aggregate wealth does not alone suffice to condemn a policy,
wealth is now a very important factor in national security.

The subject of logical method the best work is J. N. Keynes, The Science of Political, London, 1893.

The subjects of Free Trade and Protection are treated in most of the foregoing works; the following are especially valuable: C. H. Bastable, Theory of International Trade, 2, London, 1890; F. W. Taussig, Tariff History of the United States, New York, 1896;—Buxton, Principles of National Trade, London, 1904.

P. Poverty in its economic aspects, the Reports of the English Poor Law Commission, 1900, with their voluminous appendices, are the amplest source of information. The special points which are dealt with in this article are treated more fully in: W. H. Beveridge, Unemployment, London, 1890; R. D. Foulis, Distribution of Wealth, New York, 1890; R. R. Seligman, Principles of Economics, New York, 1902;—W. H. Beveridge, Women’s Work and Wages (in Birmingham), London, 1905; and the Report on Home Work (no. 24, 1865), Issued by a Committee of the House of Commons, London.

It is impossible to indicate here the vast literature on other phases of political economy, such as Public Finance, Monetary Problems, Trusts, Socialism, Trade Unions, Industrial History, etc. A good bibliography, entitled What to Read on Social and Economic Subjects, is compiled by the Fabian Society and published by King, London, 1910, may be recommended for those desiring guidance on particular topics. The two best Cyclopedias are: R. H. I. Palgrave’s Dict. of Political, 3 vols., London, 1894-99, Appendix i; and Conrad’s Handwörterbuch der Staatswissenschaften, 9th ed., 1896.

STANLEY H. TURNER.

ECSTASY. 1. Definition and forms.—"Ecstasy" (κατάβασις) may be defined as an abnormal state of consciousness, in which the reaction of the mind to external stimuli is either inhibited or altered in character. It is much more restricted, as used in mystic theology, it is almost equivalent to 'trance.' During ecstasy the visionary is impersonal, loses interest in sensual enjoyment, and even feels no pain. In the wider sense, all self-induced excitement may be called a kind of ecstasy.

Among human beings in every stage of culture there is a natural tendency to seek some means of exalting the consciousness above the ordinary level of daily experience. The satisfaction which is sought from this heightening of the consciousness may be either a sensual, or of a intellectual, or of an aesthetic kind. It is generally, but not always, associated with religion, since the experience is most easily explained by supposing that the soul has been brought into communication with higher powers. The means used to induce this mental rapture are very various, and have all been discovered empirically. The "kuren-drinking" of the Japanese, the inhalation of tobacco-smoke by the North American Indians, the use of hashish (Indian hemp) by some two hundred millions of Asians and Africans, and the use or abuse of alcohol— the favourite medium of intoxication among the white races—and of opium by the Chinese, are all expedients for artificially altering the state of consciousness in such a way as to produce pleasurable sensations; and most of these are used to induce quasi-religious ecstasy.

Very different methods of liberating the mind from the trammels of ordinary sensation are protracted fasts, flagellation, orgiastic dancing, self-sacrifice, or jumping, and self-punishment by the mechanical application of worsted thongs. 'Oun' by the Buddhists, 'Hasan Husain' by Muhammadan Shi'ites, and the Paternoster or Ave Maria by Roman Catholics, or by gazing steadily at some bright object (see Crystal-gazing), or at some part of one's own body (the tip of the nose, by some Indian contemplatives; the navel, by the monks of Mount Athos). It is difficult to describe the generic type of ecstasy, especially in what may be called its lower forms, since its manifestations are determined partly by the nature of the means employed and partly by the mental state and character of the experimenter. The phenomena of drunkenness differ from those of opium intoxication; the dancing dervish works himself into a different state from the bowing dervish; the dreams of the Persian mystic, inspired partly by wine and strongly tinged with sensuality, are very unlike the raptures and torments of the Roman Catholic eustasia; and these again differ widely from the vision of the all-embracing and all-transcending union which gave to the neo-Platonic philosopher the assurance that his quest of the Absolute had not been in vain. The yoga in ecstasy feels the blissful void of Nirvāna; the ecstatic ascetic experiences the indescribable mysteries of the higher spiritualities; heaven and hell opened to his view; the Roman Catholic fanatic sees heretics torn with hot pincers; the Platonist sees the forms of earthly beauty transfigured through their eternal and more lovely archetypes. In every case the dominant interest and aspirations of the inner life are heightened and intensified, and in every case the enhanced force of auto-suggestion seems to project itself outside the personality, and to acquire the mysterious strength and authority of an inspiration from without.

2. History.—The historical manifestations of ecstasy fill so large a place in the records of religious experience that only a few typical examples can be given. The ancient Greeks were no strangers to what Plato calls "euphoria"; but orgiastic religion was scarcely indigenous in Hellas, and was especially associated in the minds of the Greeks with the barbarous land of Thrace. The Bacchos of Euripides is a magnificent study of the sinster aspect of ecstaticism. Under the Roman Empire, Oriental cults of an ecstatic type were widely diffused; but by this time the population of the European provinces was largely of Asiatic or African origin. Descriptions of
religious frenzy are to be found in Lucretius, Catullus (the *Attis*), and Apuleius. The mystery-cults of the Empire were designed to induce both higher and lower forms of ecstatic feeling. Meanwhile and in the fourth century, the use of psychedelic drugs, which are the conclusion and achievement of the dialectical process and the ultimate goal of the mystical state is encouraged by the later Platonism. Ecstasy was for Plotinus the culminating point of religious experience, whereby the union with God and full knowledge of Divine truth, which are the conclusion and achievement of the dialectical process and the ultimate goal of the mystical state, is realized also in direct, though ineffable, experience. Plotinus enjoyed this supreme initiation four times during the period when Porphyry was with him; Porphyry himself only once, he tells us, when he was in his 68th year. It was a vision of the Absolute, 'the One,' which, being above even intuitive thought, can only be apprehended passively by a sort of Divine illusion into the expectant soul. It is not properly a vision, for the seer no longer distinguishes himself from that which he beholds, and it is impossible to speak of them as two, for the spirit, during the ecstasy, has been completely one with the One. This 'flight of the alone to the Alone' is a rare and transient privilege, even for the greatest sages, and Plotinus himself only say that he has all his desire, and that he would not exchange his bliss for all the heavens of (Evan. vi. 7. 34. vi. 9 passim). From neo-Platonism this philosophic rapture passed into Christianity, though we seldom again find it in such a pure and elevated form. We trace the succession of metaphysical mystics from pseudo-Dionysius to Eriugena, Eckhart, Boehme, and Swedenborg. Some modern poets have described an experience similar to that of Plotinus. Wordsworth, for instance, speaks of being led on 'Until the breath of this corporeal frame / And even the motion of our human blood / Almost suspended, are laid asleep / In body, and become a living soul; / While with an eye made quick by the power / Of harmony, and the deep power of Joy, / We see into the life of things' (Lines composed above Tintern Abbey).

Tennyson records:

'A kind of waking trance I have frequently had, quite up from boyhood, when I have been all alone. This has generally come upon me three repeating my own name two or three times, and quite self, till I come at once, as it were, out of trance; intensity of the consciousness of individuality, the individuality itself, the sense of being awake and alive and in a state of intense consciousness, and not a confused state, but the clearest of the clearest, the surest of the surest, the least of the least, utterly beyond human words. Death was an almost laughable impossibility, the loss of personality (if so it were) seeming no extinction, no tranced condition' (H. Tennyson, Tennyson : A Memoir, 1897, i. 230).

This experience is utilized by the poet in his *Ancient Sage.* In his case, though not in Wordsworth's, acknowledged methods of self-hypnotism are recorded as inducing the trance. Boehme, too, prepared for his visions by gazing intently at some bright object. The mystics of the cloister and cell are often described as leading us to the contemplative journey, an experience hardly to be looked for in this life, it came to be regarded, by the directors of the monasteries and abbeys, by those persons as accorded by God as an encouragement to beginners. Aspirants after holiness are bidden not to be disgusted by the cessation of such favours, since this was the normal course of education in the inward life. It should be added that the best directors deprecate any great importance being attached to ecstasy as a sign of progress in holiness, and discontinue recourse to mechanical methods of inducing it.

There are two periods in the history of Christianity in which the mystical experience was not only possible but usual. The first was in the 14th and 17th centuries. In both cases the great ecstasies came soon after a great spiritual and intellectual awakening—In the earlier period the culmination of the Christian theology and the revival of mental activity which accompanied it, and in the later the Renaissance and the Reformation. Unless at exceptional epochs like these, ecstasy seems to be more common in the lower levels of culture. We find it at present very common in Russia; while in Western Europe and America it appears from time to time as a phenomenon of 'revivals,' which spread chiefly among the semi-illiterate peasantry. Individual ecstasies are often men and women of high cultivation, though with unusual and partly abnormal psychical endowments. But, as a social phenomenon, ecstasy is a much more common and endemic among normal people, chiefly belonging to the lower classes. The study of psychical epidemics is still in its infancy, and is a subject of great interest and importance. From this point of view, the individual is only an element in the general psychical storms, which sweep over whole populations. Ecstasy is communicated by direct contagion, just as panic invades whole crowds. Ecstatic manifestations are the waves of religious excitement which produced the Crusades, in which millions of ignorant folk met with their death; the outbreaks of the dancing mania ('St. Vitus' Dance), which in Central Europe followed the devastating pestilence called the Black Death; the tarantula epidemics in Italy in the 14th and 15th centuries, which were attributed to the bite of a spider, but were certainly due to psychical contagion; the 'convulsionists' in France at the beginning of the 18th century; the 'Jumpers' among the English Methodists; and the trances which were not uncommon during the recent Welsh revival.

In extreme cases, ecstasy produces complete insensibility. 'Schwester Katrei,' who is spoken of as a pupil of Eckhart, is said to have been carried out for burial when in a cataleptic trance. Anæsthesia of the skin is very common during the ecstatic feelings nothing when pins are driven into his flesh. A poor girl in Germany persuaded her friends to crucify her, and expressed only pleasure when the nails were driven through her hands and feet. Here there was no loss of consciousness, the ecstatic feeling nothing when pins are driven into his flesh. A poor girl in Germany persuaded her friends to crucify her, and expressed only pleasure when the nails were driven through her hands and feet. Here there was no loss of consciousness. There is only extreme spiritual exaltation, inhibiting the sensation of pain. It is almost certain that many of the martyrs endured their terrible tortures with but little suffering; and even so a criminal as the assassin of William the Silent bore his cruelties with the same unnatural fortitude. In the account of the martyrdom of St. Perpetua and St. Felicity, the three hours as if dead'; and of one of the 'Friends of God,' Ellina von Crevelsheim, we read that, after remaining dumb for seven years, absorbed in the thought of the Divine love, she fell into an ecstasy which lasted five days, during which she had a revelation of 'pure truth,' and was exalted to an immediate experience of the Absolute. She 'saw
the interior of the Father's heart,' was 'bound with chains of love, enveloped in light, and filled with peace and joy' (Underhill, *Mysticism*, p. 441).

Although there is a natural tendency to ascribe the phenomena of self-induced trances to the diabolical influence, the experts in this strange science were constrained to admit the frequency of 'diabolical counterfeits,' and to caution the aspirant against the wiles of our ghostly enemy. It was observed that unusually the result of too impatient craving for supernatural favours, though it might assail even the trustiest saint, especially after too rigorous self-discipline. It was also a matter of common observation that self-induced trances were frequently followed by intense mental depression, and by that sense of abandonment by God which was called 'the dark night of the soul.' These reactions were, indeed, expected by all mystics, and were explained as the last death-pangs of the lower nature, before the final illumination. They were frequently merely the result of nervous exhaustion, but, if induced by the wrong impulse, ecstasy being (from the psychological point of view) an extreme variety of mono-idealism.

In conclusion, we must ask a question which to the religious mind is of the greatest importance. What is the value of ecstasy as a revelation of objective truth? Has it any of the transcendental value which has so long been claimed for it? To ask if the subject is believing in truth, the notion that the emptiness of the trance is a sign that the subject is in contact with absolute truth may probably be dismissed as an error, though it has the sanction of many great mystics. The doctrine implied may be stated in the words of Aquinas:

'... the higher our mind is raised to the contemplation of spiritual things, the more it is abstracted from sensible things. But the mind, when it conceives spiritual reality, is in a consequence, raised above the things of the lower nature. Therefore the mind that sees the Divine substance must be wholly divorced from the bodily senses, either by death or by some rapture' (Summa contra Gentiles, III. 47).

The argument is that, since we can see only what we are, we cannot apprehend the Absolute without first being divested of all that belongs to particular individual existence. We must sink into the abyss of nothingness in order to behold the eternal. The fallacy of the conception is apparent.

The warning of Plotinus, 'to seek to rise above intelligence is to fall outside it,' is very pertinent here. And, secondly, the apparent externality of the rapture, which in the above account of their supposed high antiquity of the Edda songs, but this being considered somewhat farnforth, modern scholars have proposed other explanations. Konrad Gislasen tried to show that the name is a development of the word with _Oddi_, the old seat of learning in Iceland, and the place where Snorri himself was educated. Both these explanations are, indeed, exposed to philological objections, but the former is the better and more natural. Originally Edda was only the title of the didactic work of Snorri, in one of the chief manuscripts of which we read: 'This book is called Edda; it was composed by Snorri, and no one has approached the art of it.' (Cod. Upsaliensis). This manuscript was discovered by the famous bishop of Skálholt, Brynjolf Sveinsson (+1675), who was also the possessor of the chief manuscript of the Eddie poems. The discovery of these manuscripts led to the theory, based upon the intimate relation of their contents, that the two books were closely connected, and the manuscript of poems was also called 'Edda,' without any sufficient reason. The manuscripts came to be spoken of as the 'Elder' and the 'Younger' Edda, the former of those appellations being given to the manuscript containing the ancient poems; this manuscript was also called _Sturlsundi Edda_, as the songs were erroneously supposed to have been collected by the famous priest Snæmund fróði (+1133). This last name has come into general use, but in our own times the poems are mostly called 'the Eddie poems;' and, as these are the chief source of Snorri's work, the appellation is not altogether incorrect.

2. The Edda of Snorri Sturluson.—This work was composed for the famous historian and chieftain Snorri Sturluson (1178-1241), one of the most cultured and highly gifted men of his time. Besides his chief historical work, _Heimskringla_, he left another, the _Edda_, a manual for young beginners in the art of poetry. It is a compendium of the poetry of all the old TENtOIC peoples there had been developed a special poetic language, consist-
ing of simple or composite words, which either had a particular significance, or had been longed to the spoken language (cf. in A.S. such words as bæggyn, ‘a minuscule prince,’ hrin-
gedlæfna, ‘a ship,’ etc.). In Norway and Ice-
länd, and, in particular, in Iceland, especially in the matter of the intricacies of the metrical art, attained its highest development, and was elaborated systematically at an early period. The composite appellations called kenningar, a certain amount of knowledge was indispensable; we also meet with certain cases indicating that the younger scalds learned from their older colleagues the mysteries of their art. Snorri himself, in a poem, felt carried on to write the manual of the art of poetry, his Edda. That work consists of three parts.¹ The middle part is called Skaldskopnarm (‘the Language of Poetry’), and gives general rules for poetic denominations of living things, the old Norse names of dead things, composite denominations of Odin and poetry, gods and goddesses; and the appellations of heaven, earth, sea, sun, wind, fire, winter, summer, man, god, battle, weapons, ships, God (at the Chris-
tians), kings. Then follows a list of the simple and composite names in a similar order, all ac-
companied by scaldic verses, serving as examples. Lastly, there is an appendix (efhjelm-
nyms from everyday language). Two manuscripts add some lists of names (in verse), but they are interpolations and did not originally belong to Snorrí's work. The author sometimes inserts longer stories to explain the origin of some of these names; but, as already mentioned, the old myths were the basis of the whole, and so Snorri found it convenient to write as an introduction to the work a complete survey of the old mythology, based on the best sources—the ancient poems relating to the gods (the 'Eddic poems'), and various living traditions. In those times this was a bold thing to do, but he succeeded in giving such a view of the whole substructure of the work could hardly have been done better, considering the circumstances. He proceeds systematically, beginning with the cosmogony, and its accessories; then follows a description of the oldest times of the gods, the golden age, and the Ash of Yggdrasí (the world-tree). This is followed by an account of the gods and goddesses, their place of abode, Valhall, and everything connected with it; he then relates more fully two myths of Thor's exploits, and proceeds with the story of the deaths of Balder, the imprisonment of Loki, the wonderful things foreboding the approach of Ragnarök; and, finally, he gives a wonderful description of that last fight of the gods, the final battle at Útgarð, Ódin at the head of the Aesir, and their victory. All these things are presented in a dialogue be-
tween a Swedish king, Gylfí, and the trinity of Ódin. The name Gylfasteining (the Delusion of Gylfí) alludes to this, as Gylfí does not know with whom he is speaking.

Snorri's sources were principally the three im-
portant Eddic poems, Völuspá, Vafþrúðnismál, and Gímanaþmol, and a few of the other poems; he chiefly used the Völuspá, from which he probably got the idea of the arrangement of the whole. He

¹The form varies in the chief MSS—Codex Regius 2927, 4 in the collections in the Royal Library, Copenhagen; Codex Arnamagnæus 242, ed. in. the University Library, Copenhagen; and Codex Upsaliensis, Beinardì in. 11, in the University Library, Upsa.—and partly in some other MSS.

often quotes verses from these poems, but not so frequently as in the older works. He does not frequent the myths critically, sometimes in a somewhat arbitrary fashion, and he has not escaped the influ-
ence of Christian ideas, especially at the beginning. His greatest faults are the punishments, which in the Völuspá come before Ragnarök, are placed by him after that event—a total misconception. Another source was the oral tradition, so strong and vigorous in Iceland. The style is magnificent, everywhere, and has many stern, earnest and solemn, and playful and jocose, always full of life. The author reveals himself as the great master of Icelandic prose.

Among the first and the second part—as an introduction to the latter—there is a very interesting chapter on the origin of the 'drink of the poets,' and how Ódin became the owner of it. Thus Ódin, alone of all gods and men, was the owner and giver of the poetical faculty, and he was said to give 'the drink of the poets' to his favourites.

The third chief part of the Edda is Snorri's own poem, the Háfnings, consisting of 102 verses in praise of Hákon the Old, king of Norway (†1263), and Earl Skúli. The peculiarity of this poem is that it is written in various kinds of metre, arranged systematically; Snorri has, how-
ever, missed the older and the younger kinds of Icelandic metrics; he begins with the 'most per-
fest' kind of metre (drottkevær háttur), which in reality is the youngest, and places at the end the oldest kinds of metre, those used in the Eddie poems, and some other metres closely related to them. Of course, Snorri everywhere uses the scaldic phraseology. The reason why he placed his own poem before others is simply that he desired to show how his theories looked when carried out in practice. The poem exhibits the technical finish of Snorri, and his complete mastery of the language and the difficult metres.

This poem gives us a hint regarding the time of the composition of the work, but only a terminus ad quem. It cannot have been composed earlier than the winter of 1222-23, and certainly not very much later. Snorri had lived between 1218 and 1220 at the courts of the princes he praised. The poem is a thanksgiving for the honours bestowed on him. It is most probable that the two earlier parts of the work were written, partly at least, before 1215, but the whole poem may have been written in the years 1217-21.

The Edda of Snorri is one of the principal works of Icelandic literature, admirable both in form and in contents, and quite unique in the latter regard. Of course, it does not give us a perfectly accurate picture of the old heathendom which had then been practically extinct for 200 years; but, on the other hand, it is certain that it always must remain one of our principal sources of information regarding that faith, as the old traditions were preserved in Iceland with a singular tenacity and faithfulness, owing to the remoteness of that country and its very limited intercourse with the outside world.

In one MS (A.M. 242) there are added four gram-
matical treatises, of which the second is found also in the Upsala MS, and the third also in two frag-
ments. Their contents are linguistic, rhetorical, and didactic, but they have nothing to do with Snorri or his Edda. The first of these treatises is on the phonetical system of the Icelandic language in the 12th cent., and is of extreme value. The third treatise is written by Snorri's nephew, Ólafur Jónsson.

LITERATURE.—Q. EDITIONS: The great Arnamagnæan ed., 12 vols., Copenhagen 1847-67, with the Codex Arnamagnæus 242, ed. in. the University Library, Copenhagen; and Codex Upsaliensis, Beinardì in. 11, in the University Library, Upsa.—and partly in some other MSS.
The Eddic poems (the 'Elder Edda', 'Sunnunnad Edda').—These famous poems are for the most part found in a single MS, 2963, 4°, in the Old Royal Collection in the Royal Library in Copenhagen (Codex Regius). The MS consists of 45 leaves, but a whole sheet (8 leaves) is wanting, thereby causing a deplorable lacuna. The MS dates from about 1270, and it was discovered shortly before the middle of the 17th century. It is a very fine one; a phototype edition, with the text printed on opposite pages, was published by L. Wimmer and F. Jónsson in 1891. The first known owner of the MS, Bishop Brynjólf Sveinsson, presented it to the Danish National Library. We know only six leaves of another MS, A. M. 748, 4° (Univ. Libr. Copenhagen), containing some of the same poems as Codex Regius, with one addition, but partly defective.

The contents of Cod. Regius may be divided into two groups: (1) mythical and (2) heroic poems, arranged in a certain, but imperfect, chronological order, which could more easily be applied to the last group of the legendary poems, as the persons described there are all genealogically connected. In the mythical group this was generally impossible, except in one case. Here the interest of the poems centres in the feeling of the man and the gods. One heroic poem, the Volundarkviða, has been incorrectly inserted in this group. In each group there may be observed a tendency to subdivisions, beginning with certain important poems of a more general character. The collector has in many places, especially in the last group of poems, given explanatory and connecting prose pieces. The MS is a copy, not the original collection, which must have been compiled in the end of the 12th century. The MS A. M. 748 is another copy of the original collection, with some additions. A third collection (or copy) was in the possession of Snorri Sturluson.

The Mythical poems (the 'Edda'), a grand poem, is a world-drama having for its subject the mythical life of gods and men from the beginning of the world to Ragnarök; the death of Balder is the central event. The dominating thought of the author is that all evil deeds breed fighting and death. The poem is written throughout in a tone of stern morality. It was composed about the middle of the 10th century. The next in order is the Húsavatn ("The Song of the High One"), a collection of several fragments of poems, all of a more or less ethical and moral character. The first poem is the principal one; in it Odin gives counsels to the human race, as to what is best for man, and how to behave in the different conditions of life, ending with pointing out that after death a good name is the best. Another poem contains the magical songs of Odin; and a third has counsels to a young man, of a similar character to the first. Then follow some poems, which are pre-eminent Odin says: Vafþrúðnismál ("Lay of Vafthrudnir"), describing a trial of wits between Odin and a giant; the giant is defeated, and loses his life; in Grímnmál ("Lay of Grimnir"), Odin reveals his terrible character to a blind and hard-hearted mortal king, his son, Sigmund; in Grímnismál ("Lay of Grímnir"), Thor quarrels with the disguised Odin, whom he does not know—a struggle between wisdom and mere strength, where wisdom prevails. Thor is the mythical hero of Jómsvötn ("Song of Thrym"), which tells of how he lost his hammer and recovered it.

The beautiful poem Skírnismál ("Song of Skirnir") describes Frey's vehement love for the giant maiden Gerðr; while there are the Lótrisaður ("Wedding of Loki"; cf. Völuspá) a story of the world-duel between Thor and a dwarf. The beautiful poem Skírnismál ("Song of Skirnir") describes Frey's vehement love for the giant maiden Gerðr; while there are the Lótrisaður ("Wedding of Loki"; cf. Völuspá) a story of the world-duel between Thor and a dwarf.

To these lays of the gods there are generally added some poems found in other MSS: Hymndóttir ("Song of a daughter") (from the Flesy Codex), relating how Freyr procures information from a plangent regarding the family of her favourite, Odin. Here is found inserted a fragment of a mythical Völuspa in skamna ("The Short Völuspa"). Vígaþula ("Song of Vígur") (found in the 2nd half of the 13th century) is an incantation; the source of the different social orders of men, and the supposed development of social life. The poem, which ends by mentioning kingship, was possibly composed to honour of Harold Fairhair. Grípr ("Magical Song of Grípr") and Völundamál ("Song of Völundur"), the two together and translated as "The Song of Svipdag" (probably a mythical person), who gets good advice from his dead mother Gríl, and then starts on a dangerous journey in pursuit of his ladylove Menglöd.

To the second group of Eddic poems, the heroic lays, belongs first of all the important poem, mentioned above, Völundarkviða ("Lay of Wayland"), describing the smith Vélund, his imprisonment by king Njó and his revenge on the king and his family. Then there follows a group of Holmgjóður ("Helgi Lays"), two poems about Helgi Hundingsbann, who is contrasted in a philosophically—more or less—dialectical poem, the Volsungær ("Lay of Regin"), fragments of two poems—the first great deed of Sigurd; Fáfnismál ("Lay of Fafnir"), on the slaying of the serpent Fafnir; Sigurdr finished, a second poem, beginning with the meeting with the Valkyrie Sigrdrifa, and the good counsels which she gives him. Here comes the lacuna mentioned above; there must at least be two long poems wanting (cf. the Volsungs saga).

The text begins again with a poem relating the murder of Sigurd; he had been married to Gúðrún, daughter of king Gjúki, and had been brought (by magical means) to forget the Valkyrie Sigrdrifa (Brynhild), a sister of Atli Buðsótt (Attila), who had been treacherously married to Gunnar Gjúkason. In a following poem the characters of these two ladies, the principal female actors of the story, are contrasted, and what is best for man, and how to behave in the different conditions of life, ending with pointing out that after death a good name is the best.
she gives a survey of her tragic story. The next two parallel poems, Attakksa and Atlaamda ("Songs of Atli"), the latter called (the Greenlandic, because composed in the Icelandic colony in Greenland), describe, each in a slightly different way from the other, the relations between Atli and Guðrún and her brothers; both are killed at Atli's command, and Guðrún in revenge causes his death. Now, one would think the tragedy would be at an end, but the last act remains. Guðrún conspires to have the three sons of Sölvi, Haraldr, and Ólaf drowned, and begets a son on them. Thus, in her marriage to King Jörmunrekkr, who has accused her of infidelity, and at his command she is to be put to death by horses; she is revenged by her brothers, who also are killed. Such are the contents of the two last poems in Cod. Reg., Guðrúnarkviða ("The Urgings of Guðrún") and Hamblandi ("Lay of Hamblóir"). Grettis Saga ("Song of the Grétta") must also be reckoned with the heroic lays; it is found in a MS of Snorri's Edda, and treats of the giant maidens grinding gold, peace, and, at last, death to Froði, king of the giants.

The legends of the heroic poems were originally, for the most part, German importations into Scandinavia, where they have been transformed and imbued with the expression, spirit, and combinations with each other without regard to original times or places. They are of primary importance for German and Teutonic legendary history. The persons are idealized; they are typical heroes and heroines, a quintessence of the people of the Viking age. Some of the minor characters are, however, drawn from common life. The descriptions of persons and events are exceedingly clear and racy and spiritually, and the language is correspondingly so. The sentences are short and pithy, everything superficial is banished; still, the poems differ in this, that some are more wordy than others; difference in age may be inferred from this.

The age of the poems is on the whole, the period from A.D. 900 to 1050. This may now be regarded as beyond all doubt. But within the limits of this period there may be discerned older and younger groups of poems, when we consider the more or less elaborate descriptions, stories, the persons mentioned, etc. Thus Þrymskviða, Völundarkviða, and Hrynhúsi are among the oldest; Sigurðarkviða, Snorra-Edda, and Hrafnagampr are among the youngest. Only a few are very young, from the 12th cent. (Grípspsá, Vólsunga in skamna), and belong to a late Renaissance of Iceland poetry.

The home of the poems has been the subject of much dispute. Some maintain that they are all Icelandic, others think they are all Norwegian, or composed in the Norwegian colonies in the British Islands. One poem can definitely be proved to be Greenlandic (Atlaamda). The truth is that everything of value for deciding the question of the home of the poems points decidedly to Norway; Norwegian life, Norwegian culture, and Norwegian nature. The poems must, therefore, be Norwegian for the most part. We have no certain way of deciding what is Norwegian and what possibly may be Icelandic. It is not right to consider poems as entirely Norwegian if they have a few backward signs pointing to a Norwegian origin; all these poems are on the same level; there is, on the whole, the same way of considering life, and the same disposition, and might they are all of the same school in spite of their different age.

The metres of the poems are chiefly the three oldest: fornmyting, verses of four syllables, in the epic poems; maldaháttr, strophes of six verses of different length, in the moral and didactic poems; málalóttur, verses of five syllables, in epic poems. One poem, Tryggvason (dated 1132), is a work which may probably belong to the same stock as these. All the poems are strophical, each strophe as a rule consisting of eight verses—six in jofnattyttur; when strophes of more or less than eight verses are found, this is probably due to corruptions of the text. The tradition was unique only for perhaps more than 200 years, and, of course, as might be expected, rather bad. Strophes or verses are often lacking, or words are so corrupted that it is very difficult to make, and bear the names of, them critically, metrically, or linguistically. Some verses are in the tradition given in duplicate form, and the collectors have written down both without choosing between them.

The poems are of all anonymous, probably because the authors considered themselves only as narrators of known subjects. It may, however, be considered as certain that they gave the poems certain individual colours, and moulded the characters with their psychological peculiarities. How far they invented new persons or events has not been decided conclusively. On the other hand, it is certain that they were very independent in their combinations of the old legends.

LITERATURE.—(O) EDITIONS: S. Bugge, Normann fornforvaltning, Christiania, 1867 (in fundamental value); photographic ed. of the Cod. Reg. with abbrev. ed. in the Acta Latina in, et in Germania Antiqua, ed. by W. J. and F. Jönsson (Copenhagen, 1891), of A. M. 745 by F. Jönsson (Copenhagen, 1892), of A. M. 1781 and 1904, with a dictionary by H. Gering (3rd ed., Halle, 1897), ed. with commentary by W. J. (Skei- derne, 1895), of the Scalps by E. O. E. and P. O. (Leipsic, 1896), and above all, B. Sjömons (Halle, 1888-1906, vol. i) (in text with variants; vol. ii, a complete dictionary by Gering, vol. iii, for historical comments, has not yet been edited; vol. iv, a long and excellently written introduction, treatise critically the various TRANSLATIONS: Danish, by O. Hansen (Copenhagen, 1911); Danish, by O. Hansen (Christiania, 1899); Swedish, by G. G. (Stockholm, 1883); German, by H. Gering (Leipzig, 1922); English, by B. Thorpe (London, 1850); an ed. with an Eng. tr. is also found in G. Vistisen's Corpus poeticum bœræor, Oxford, 1888 (tr. in prose, bad text). Besides the dictionary by Gering, already mentioned, Skjærvåg's Epigoniisk Lexicon, antiquus Rigus septentrionalis (Copenhagen, 1899) deserves to be noticed. On edifying the great number of treaties on special subjects the reader may be referred to Sjömons edition.

EDOMITES.—I. Introductory.—"Edom" is the name of a people frequently mentioned in the OT, and generally located to the south of the Dead Sea. They are regarded as a brother of Israel, and are related to Israel in all its historical, geographical, and national development. In the popular stories in Gn 25, 27, 32 ff., which represent Esau—i.e. Edom—as the elder twin-brother of Jacob, who is otherwise known as "Israel," apart from the direct genealogical relationship, it is evident that the culture and religion, there is good reason to believe that the Edomites and allied peoples of the area lying outside Israelite territory, and especially in N.W. Arabia, played a somewhat prominent part in the development of Israelite religion and history. The name has often been emphasized since the earlier observations of Well- hausen, Kuenen, Stade, and Robertson Smith; and in recent years has come more to the front in Biblical research. In discussions of the origin of
the Israelite Yahweh, the tribes of Israel, the rise of the kingdom of Judah, the locale of the patriarchal stories, the extension of the term 'Egypt' (Heb. Masrayim, Assyr. Muzri) outside the limits of Egypt—in these and other questions the Edomite area, its population and history, and its relations with Israel invariably enter into the field of inquiry; and it is therefore necessary to premise that a treatment of the religion of the Edomites underlines the particular problems of the OT which cannot be discussed in these pages.

The Edomites are otherwise known as 'Eesan,' or 'sons of Eesan,' after their reputed 'father'; and as 'sons of Selh,' after the district of Mt. Seir. Their land may be described as the district between the Dead Sea and the Gulf of A'kabah, bounded by Moab, Judah, S. Palestine, the Sinaitic peninsula, N. Arabia, and the Syrian desert; the more precise boundaries varied from time to time according to the larger political circumstances affecting the surrounding States or confederations. Thus, for purely geographical reasons, it was entirely exposed to the political, social, and religious movements in Western Asia; and its virtual independence cannot be understood apart from the history and thought of the old Oriental world. An important fact is the very close relationship which, as the Horiite and the Edomite, the Edomites held to the Sinai movement, which felt to subsist between the Edomites and their neighbours; Edom, Midian, and Iehmael are intimately connected, and names of Edomite origin or affinity can even be traced in the Israelite tribes of Judah, Dan, and Benjamin. It has long been recognized that the tribe of Judah as constituted in 1 Ch 2 and 4 was 'half Arab,' and of its two main divisions Edomites (Canaanite), the former is explicitly connected with the Edomite Kenaz (Gn 36:1, Jg 12:1, 1 Ch 4:1), while Edomite or 'Horite' elements are somewhat stronger in the latter (see Meyer and Luther, Die Israeliten u. ihre Nachbarstaaten, Halle, 1866, p. 400). The whole body of evidence, when carefully studied, is such as to suggest that a closely inter-related group (which may be called Horiite, Seirite, or Edomite-Ishmaelite) extended westwards into S. Palestine, and that some portion separated and was ultimately incorporated in Judah, thus becoming truly Israelite (see ib. p. 446). This relationship, to which the genealogies testify, is to be supplemented by the Aramean and Edomite extension, which is of special importance in the OT, the full significance of which can as yet be only imperfectly understood.

2. The gods.—Although there is little direct evidence for Edomite culture and religion, there is much that is indirectly valuable, and, even though it is often a somewhat hypothetical character, it cannot properly be ignored.

(a) Edom itself may be the name of a deity. This is suggested partly by the name of the Gittlet Obed-Edom in the OT (2 S 6:19, 1 Ch 15:24, 2 Ch 29:22, etc.), who becomes prominent as a Levitical singer and doorkeeper. The interpretation 'servant of [the god] Edom' is not to be rejected, although it is open to dispute whether the deity in question is necessarily identical with the familiar Edom. Further, Egyptian evidence for a place-name Shemesh-Edom in the Lebanon district (time of Thothmes III. and Amen-hotep II.) seems to equate Edom with the sun-god; and the deity appears in an obscure Egyptian passage, together with names of the gods of Khemmis and Liting (W. M. Müller, Asien u. Europa nach alt-ägypt. Denkmälern, Leipzig, 1893, p. 315 f.). This would suggest a deity of the Hadad-type, fairly well distributed, who became the god of a group of people, and who is represented by himself by his temple at the border between Edom and Moab ('Ain Qudra). The name is found in Phoenician and the Sabata inscriptions (cf. perhaps also Liddell, Ephemeris f. sens. Epigraphica, Giessen, 1904, l. 411).

(b) Edom.—This obscure name, perhaps found in an old Arabian inscription (Hommel, Südarab. Christenthum, Munich, 1893, p. 301 f.), has been plausibly connected with that of the goddess 'A-sit, represented on Egyptian monuments as a wild, warlike rider of the desert (Müller, 340). The Biblical story of Edom, the wild hunter, is commonly associated with the Phoenician myth of Usos and his brother Samiramur or Tyepedros ('high heavens') the god of the elusive and civilized brother and the hunter Usos naturally recalls the account of the twin-brothers Jacob and Esau, and the various points of resemblance between the late euhemeristic Greek record and the older, simpler, and more primitive story in Gen. are sufficiently close to suggest some common Canaanite cycle of tradition. In its present form, the story of Esau and Jacob clearly shows the influence of other elements, and Goldmann has drawn attention to features in Esau which are suggestive of some satyr-like figure (ZATW, 1900, p. 22, n. 3); a considerable modification of the original tradition must in any case be recognized. There is other evidence for some survival of the Canaanite myth in the Cainite genealogy (see J. Skinner, Gen., 1910, p. 123 f.); and consequently, both here and again in the stories which the Edomites are supposed to have told, the forms and elements are the outcome of a very intricate development. Hence, although the above evidence may be used to prove that primarily Esau was not a distinctly Edomite figure, it is clear that the Biblical story in its present form belongs to a time when Esau stood for some section (at least) of Edom, and that this fact alone explains its preservation elsewhere in the Bible.
circumcision. It is true that, according to Jos. (Ant. xiii. 1), the Edomites were circumcised by John Hyrcanus, but this usage may have been introduced then for the first time (see Jer 34:5, cf. Ezek 44:3, and the circumcision of Ismael in Gen 17:12). It is more likely, therefore, that, as Smith suggests (EB II. 688), a Jewish rite of circumcision shortly after birth was substituted for the rite in use among the kindred peoples, namely, circumcision shortly after the first storm, the latter alone being recognised as real circumcision by the Jews.

On a priori grounds it is reasonable to assume that Edomite religion was not isolated from that of the surrounding peoples. The traces of Egypto-Semitic cult found by Petrie in the south of the Sinaitic peninsula date before the age of the Israelite monarchy, but point to the antiquity of definite religious ideas in the desert region outside Palestine. It is interesting to notice that about the 6th century B.C., in an Aramaic inscription from Yemena, Ismaelite, Gen 25:2, named with Dedan, is 21:26; Jer 25:26, contact with Egypt is shown by the name Pet-Qairis, the father of a priest who ministers at the temple of M-b-r-k, a form of a more prominent deity), Shingalwa (Wm, perhaps a form of Astarte), and Ashira ( apparently the well-known Ashira, Ashirat). But the inscription also shows influences of the Hurrian cult of the gods of Bab.-Assyrian influence. Moreover, Edomite contact with Arabia, the presence of a Minean colony in N. Arabia at el-Ola, and the fact that the name Keren (Gen 57, son of Enoch, and corresponding to Cain) is that of an old S. Arabian deity afford a ground for further speculation. Although there is no trace in Edom of the deity Sin, the name is familiar both in ancient Arabia and in the Edomite area (the wilderness of Sin, Mt. Sinai). So also there is no trace of the cult of Ishyur-Ashtar; but the male 'Athyar or 'Aytar is found in Arabia, and is joined with Chemosh in Moab; and Aitar-Saum ( 'Ishar of the heavens') was venerated by the Edomites. The corresponding form 'lord of the heavens,' found in Palestine and later among the Nabataeans, and with an equivalent in ancient Arabia, may also have been familiar in Edom, though perhaps under one of the more definite names (e.g. Hadad, Kaus) already noticed. Finally, some indirect evidence is afforded by the points of contact between Israelite and old Arabian religion, a noteworthy example of which is the Minean throned upon high places, and which is the parent form of the Levitical altar, and by which the Levitical tradition and personal names agree in manifesting a peculiar relationship with S. Palestine, Edom, and that area which is connected more closely with the Edomites generally than with Israel.

4. Edom and Israel.—Suggestive hints for the older religion of the Edomite area may be gleaned from the Nabataean inscriptions found at Petra, which obviously were not entirely novel growths (see, further, NABATAEANS; on the later evidence for Iumein cultus at Ader, see Binning, ZAT, 1906, 220). But more direct hints for the Levitical relationships, see B. A. Cook, Critical Notes on OT History, 1907, p. 84 ff.
persistence of religious observance that some of them may have gone back to Israelite times (cf. Nm. 20:21; Job 19:21). They had not always belonged to Israel; it had been taken by Caleb (Jos 15:13), who, though subsequently reckoned to Judah-Israel, was originally a Kenizite (cf. Gn. 14:13). Thus, Edomites were more or less Edomites, Palestine-Meyer very 'Edomitic' and 'Palestinian,' and Jahweh any Edomite tradition (Die Israeliten, p. 322 ff.), and both Isaac and Ishmael are more naturally located outside Israel and Judah, in the ordinary sense of the terms. Hence, while elements of myth and legend of wide distribution appear in Genesis in a localized form, attached to definite figures and places, it is very noteworthy that much of the material is S. Palestinian. As Meyer and Luther have emphasized, the true popular Israelite tradition is scanty, whereas many traditions of Edomites, and that sort of material, have only happily arisen there (pp. 227, 239, 279, 305, 478); to call them Judaean is too restrictive (pp. 386, 443); the interests are those of the Seirite and Edomite connection (as illustrated by the genealogies) rather than of the Israelites.1

This tendency to discover in the OT data which primarily were 'Edomite' rather than Israelite involves the recognition that their presence is not fortuitous; they have stamped themselves upon Biblical (i.e. Israelite) tradition as surely as certain 'Edomite' groups became—as is seen in 1 Ch 2 and 4—Israelite. The process may be illustrated by the case of 'the line of Abraham's point of the aboriginal patriarchs and the beginning of civilization. This is evidently a piece of distinctively Canaite (i.e. Kenite) lore, and the natural inference is that it was brought into the common stock of Israelite tradition by the Kenites when they entered Judah; so, A. R. Gordon (Early Trad. of Genesis, Edinburgh, 1907, pp. 74 f., 165, 188), who ascribes to them also the account of the origin of the world (Gn 25 f). These fragments testify to some larger and more organic body of tradition, which, in its present modified form, has points of contact with old Canaanite or Phoenician culture-ideals (see Skinner, Gen. p. 123 f.; and, above all, of scholarship, Adam's grandson Ênôsh (man (Gn 4 f.)), its view of Jahwism ran upon lines quite different from the prevailing Biblical view. But, as comparative research has shown, divers peoples or tribes have their own beliefs of origins, and consequently the Kenite lore not only illustrates material brought into the Israelite stock from a S. Palestinian ('Edomite') area, but also shows, by its very presence, that through certain vicissitudes the Kenites were able to impress their tradition upon the literature.2

Edom and the desert peoples enjoy a reputation for wisdom (Ob 4, Jer 49, Bar 25), and the superlative wisdom of Solomon is emphasized by placing him above certain sages whose names have Edomite connexions (1 K 4:29—Ethan the Ezrahite, Heman, Mahol). The names recur in 1 Ch 25 as sons of Zerah (an Edomite clan affiliated to Judah (Meyer, 350)); and thus, quite apart from the question of value, the claim of a Judaean relationship is unmis- taken. See, for example, 2 S., 304 f., 200:17 E., 115 b, 158 f.; cf. also H. Gressmann, RzAW, 1919, pp. 15, 26, 29. N. Schmidt (Hz. 1905, p. 329) does not hesitate to regard Adam's line of descent as an Edomitic division, having his shrines on Mosera and Hor,' the traditional scenes of his death. The lack of written records connected with the Kenites. With the trading of mankind to Adam, 'man,' compare the suggestion that the name Edom is a dialectical form of adam (Söderberg, Ezib 11 ff.).

166 

Edomites takeable. This, however, is not more striking than the presence of other 'Edomitic' Judaeans in 1 Ch 2 and 4. Thus, 'the Edomites' in 20:3, 31, are not always too doubtful for the conjecture that these chapters contain specimens of Edomite wisdom. On the other hand, the background of the grand book of Job lies outside the limits of Edom. In fact, possibly in the Edomite area,1 and there is no a priori reason why the thought of the book should be regarded as exclusively Israelite. Further, Israelite tradition itself explicitly ascribes to the Midianite Jethro the inauguration of the priestly system (Ex 3 1, 2), and the father-in-law of Moses subsequently appears in Israel (Jg 114, cf. 41). The Levites also have connexions with S. Palestine, and it is noteworthy that such names as Obed-edom, Korah, Ethan, Heman, etc., link the temple of Jerusalem, its officers and its singers, with features which take us away from Judah and Israel.

5. Edom and Jahweh.—That Judah and Edom were very closely connected at certain periods is clear from the history of Palestine. In later times the Idumeans bear such names as Jacob (the rival of their ancestor), Phinehas, Simon, and Saul—names familiar to the outside world, and, on the other hand, the repeated occurrence of names in Kaush and Kos from the 5th cent. onwards points to tradition more distinctly Edomite; and it is noteworthy that the distribution of Edom would favour local and minor cults, the names of the kings include such more prominent and widely distributed deities as Hadad (trice), Kaush (twice), and Baal (once, in בָּנָם, son of the Mouse). It is a striking fact that, although the Edomites, like the other peoples, had their gods, they are placed by Israel apart from other heathen neighbours. The third generation after inter-marriage had full Israelite privileges, whereas Ammon and Moab were banned for ever (Dt 23 7); these two lands are regarded as stumbling-blocks, but there is no warning against Edomite idolatry except in relatively late passages. Nor is allusion made to any Edomite national deity corresponding to Milcom, Chemosh, and Jahweh, in Ammon, Moab, and Israel. Although the gods Hadad, Baal, and possibly Kaush were or had been known in Israel, Jahweh could be worshipped by the Edomite Doeg (1 S 217), and was, no doubt, known in Edom, as He also was— to judge from personal names—in N. Syria. Indeed, according to tradition recorded from the time of Adam, it was the god of the Kenites;2 and, since Gn 4 f. refers to His immemorial worship, it would seem that their clan claimed to possess the cult from the earliest times. But the evidence does not confine Jahweh to the Kenites. His rise is connected with Sinai, Mt. Paran, Seir, Teman, and probably Kadesh (Dt 533, Jg 58, Hab 3); and the persistence of this belief is shown partly by the tradition that Elijah was impelled to visit Horeb, the mount of God, in search of the true Jahweh (1 K 1966), and partly by the lateness of the reference in Habakkuk. It is clear that the Edomite area was, in some very special sense, regarded as the home of Jahweh. In addition to this, with the Kenites are associated the Rechabites (1 Ch 25; Calebite in 4 f (reading 'Rechab' for 'Rechah,' with LXX), and these certainly held that desert conditions were proper to the religion of Jahweh. Their uncompromising zeal, as suggested in the account of Jehu's revolt (2 K 1054), illustrates a reforming spirit, which finds a parallel when the Levites take their stand on Gibeon and put away the sword (Ex 32). Thus, with S. Palestine are connected, directly or indirectly, traditions of the Edomites. The name is named with Edom in La 4; and, for Eliphas of Teman, cf. the form 'Adom' in Gn 303.

Greek (W. MURBISON), p. 183.

EDUCATION (Introductory).—1. The meaning attached to the word 'Education' varies greatly. According to some writers it includes all the forces that influence the development of new generations. According to others it is limited to something so narrow as to be equivalent to nothing more than teaching. The widest meaning is well expressed in the words of John Stuart Mill, who tells us that education 

includes whatever we do for ourselves, and whatever is done for us by others for the express purpose of bringing us nearer to the perfection of our nature; to its largest acceptance it comprehends every indirect effect produced by knowledge, and on the human faculties, by things of which the direct purposes are different; by laws, by forms of government, by the industrial arts, by modes of social life; or, even by physical facts not dependent on human will; by climate, soil, and local position (Rectorial Address, St. Andrews, 1867).

He himself seems to feel that this is rather too wide a view to be of practical application, so he restricts it in the same address to

the culture which each generation purposely gives to those who are to be its successors, in order to qualify them for at least the fullest possible use, for raising, the level of the improvement which has been attained.

In both definitions it will be observed that the idea of Purpose is involved in the process of education; a love for which may have been 'a liberal education,' but the epigram 'the key to the very omission of this idea of purpose, which is always felt to be essential in education.

de S. A. Cook, Rel. of Ave. Pal., p. 88 ff.

If we examine a large number of the definitions supplied by eminent writers, we shall find that there is one term present in almost all of them. This term is 'Development.' The word itself is seldom absent, and the idea implied by it is always present. Thus Pestalozzi states his views in the familiar plant metaphor:

'Sound Education stands before we symbolised by a tree planted near fertilizing water. A little seed, which contains the design of the tree, its form and proportion, is placed in the soil. See how it germinates and expands into trunk, branches, leaves, flowers, and fruit! The whole tree is an uninterrupted chain of organic parts of the plant whose root, trunk, branches, leaves, flowers, and fruit are the respective stages of the developing tree. Man is similar to the tree. In the newborn child are hidden those faculties which are to unfold during life' (see Address on Birthday, 1816).

Froebel as a loyal disciple naturally follows:

'So the man must be viewed not as already become perfect, not as fixed and ineradicable, but as constant yet always progressively developing,... always advancing from one stage of development to another' (Menschenzweckung, Vienna, 1858, § 16).

Besides the ideas of development and deliberate purpose, there are always present in some form or other two additional ideas, those of System and of Knowledge or Culture. In a certain sense a child is educated by the process of living, even when there is no purpose of educating him, and no system in the process; but, in so far as Education

1 On some of the questions involved, the writer may be permitted to refer to the Articles 'Genesis,' 'Palestine,' and the Introduction to 1 Esdras, in R. H. Charles' edition of the Apocrypha (1912).
is treated as an art or as a science, it must be carried on with the deliberate purpose of modifying development by means of knowledge systematically impinged.

Of the four ideas that we have found to be essential to the connotation of the term 'Education,' that of Development applies to the pupil, and development, if not in the form of a plan, is the law which the educator must follow. Both of the other three are more or less under the control of the educator.

The idea of Development involves the correlative ideas of succession and the existence of an inherent law that is brought to light in the development of the organism. The idea of life, literally or figuratively, is always implied when we speak of an organism. This, indeed, would compel us to hunt for the meaning of this mysterious thing called Life, but we must here assume a knowledge of the general meaning of the vital principle. Whatever it is, it pervades the whole of the structure in which it is found. Of it we may be said, as it is said of the soul, 'it is all in the whole, and all in every part.' This distinction, indeed, is of great value in marking off an organism from much that is not an organism at all. As we discriminate between an organism and a machine, so we must discriminate between development and growth. Growth may take two forms—accretion and multiplication—but neither increases in kind or number of parts. Each of itself implies development. Increase in complexity of structure must be added to adaptation to function, before we have genuine development. Development, then, is a process of differentiation correlated with adaptation to function.

This brings us to the third essential element in the connotation of the term 'Development.' It always implies self-determination on the part of the developing organism. This, indeed, is implied in the idea of an organism. It begins, flourishes, and decays, all according to laws that are inherent in its own nature. The laws of its development are indeed part of itself. Its life is simply the exemplification of these laws. The question may be asked, in fact, which is the butterfly; is it the egg, the larva, the chrysalis, or the image? The answer clearly is that it is all of these. 'The idea of the butterfly is incomplete unless it includes all the stages through which the creature passes in the process of its development. We cannot define a developing being unless we take into account what it has been and what it is becoming to be.' The one who plants the seed both is and is not a tadpole. The acorn, the seedling, the sapling, and the full-grown tree are all essential to the true idea of the full-grown oak. The oak is implicit in the acorn; the acorn is explicit in the oak. The acorn realizes itself only by becoming an oak.

2. Theories and problems of education.—The true fundamental aim of every individual is self-realization in the widest and truest sense of the term; but here at the very threshold a serious difficulty arises. The mere phrase 'self-realization' suggests an abstraction of the first importance in Education. True self-development is self-development from within in accordance with the laws of our nature,—is there room in the process for an educator? Does it not seem almost self-evident that an educator, so far from aiding in true development, must of necessity hinder it by imposing on the developing self an influence other than that of the developing ego? This difficulty is one of the popular saying that all true education is self-education. But even Jacobot, an ingenious French teacher who, in his writings, took great pains to depreciate the work of teachers, does not go to the root of the matter. It is a strange demonstration of the uselessness of teachers that results in perhaps the most absurd of all methodologies, as Jacobot's system turns out to be. The sole difficulty is Jacobot's scheme, but is evaded by the inept plan of overt inaction. Why write a volume on Education, as Rousseau does, to prove that the teacher figures as a practically negligible element? The radical notion of selves is to be what it is in Pestalozzi, and still more clearly in Froebel. The cause of this recognition of the difficulty and the attempt to meet it is to be found in the fact that these writers seized their theory of education upon more or less clearly conceived Idealistic principles.

It is true that Rousseau usually gets the credit of being the philosopher who won Pestalozzi for Education. But Pestalozzi lived a long life, and the force that impelled him to Education was not the only one that modified his thought. Kant was just finishing his University studies when Pestalozzi was born, and by the time the educator had found his vocation, and was actually engaged in it, the Kantian thought was beginning to make itself felt. The germs of Idealism were in the air: Pestalozzi could not hope to escape the infection. The plant metaphor, which has since been so overworked, appears to have had considerable influence in modifying his principles; but the metaphor was, after all, only a concrete statement of the Idealist position.

As Kant was followed by Hegel, so Pestalozzi was followed by Froebel, and in both cases an advance in Idealism has been made. For our present purpose, principles, not persons, interest us. We are not specially concerned with either the Pestalozzian or the Froebelian development. The important thing is that the development of the whole school has given a clear demonstration of the educational effect of the theory of self-realization.

There exists at this moment a large and important school of educationalists who ground their opinions on a more or less intelligent interpretation of the life and works of Pestalozzi and Froebel. They have outlived the philosophical difficulties that troubled their later master. They have a system, which expresses what has proved to be valuable, and they are inclined to rest content without going into uncomfortable details. It was otherwise with Froebel. He felt keenly the initial difficulty of his system, and throughout the whole of his Education of the Child he struggled to bring his success to justify the educator in interfering in the work of education at all. The ordinary Kindergartners dabble in the mechanism of Idealism without in the least understanding the nature and necessity of the primary assumption that gives it life and meaning. Naturally, as soon as they set themselves to think at all, they come to a deadlock. The child is like a plant, it can grow and develop; it is growing, but only in a determinate way. True education, therefore, must aim at permitting and encouraging the child to develop in the greatest possible freedom. Froebel sees this very clearly:

'Therefore Education, Instruction, and teaching should in the first characteristic necessarily be passive, watchfully and protectively following, not dictatorial, nor visibly interfering.' Further, in the following section we are told: 'The still young being, even though as yet unconsiously, like a product of nature, precisely and surely will that which is best for himself, and, moreover, in a form which is quite suitable to him, and which he feels within himself the disposition, power, and means to represent' (op. cit. § 74).

If, then, the child thus makes for what is for his good as certainly as he would do so for the flower, it is obvious that the occupation of the teacher is in a parlous state. Why employ a man to make a child do what the child cannot help doing? The usual reply is botanical. A given seed can pro-
duc things but a particular plant, and yet there may be work for a gardener. The very elaborate scheme of gifts and occupations that characterizes the Kindergarten system shows that Froebel regarded the passive, as well as the active principle, and, by his own admission, desirable. We are therefore entitled to a better argument than a mere analogy. The problem is how to find a place for a teacher between the developing nature, with a determination towards good, and a world that is by hypothesis good, as much as all has proceeded from God, and is limited by God alone.

Froebel's answer is above Botany. The educator, he tells us, is himself a part of the world in question: he has, therefore, a place. That this place is consistent with the rest of the theory is manifest, because the teacher who is found imposing laws and restrictions on the child himself is strictly and inevitably subjected to a perpetually governing law; to an unavoidable perpetual necessity; thus all arbitrariness is banished. The educator must at every moment act under two different influences, which yet lead him to the same line of conduct. He must guide and be guided. His consistency as governed and governor is guaranteed by the continual reference of himself and his pupil to that inevitable third. The teacher, while seeking to enable the pupil to attain to self-realization, must seek at the same time to realize himself. Only by rightly guiding the pupil can the master himself be right. If the boy's nature and the master's are each developing freely, then their actions must of necessity fit into each other, and produce a harmony which is the inevitable and invariable third, in other words, the inherent rationality of the universe.

In Education, as in some other directions, the Idealist position has been accepted timidly and incompletely. Instead of boldly accepting the whole of the doctrine thus enunciated in the Education of Man, later Froebelians have selected for special emphasis the principle, 'Find what Nature intends for the children, and follow that.' 'A passivity, a following,' has become their watchword; and so true are they, in theory at least, to this view-point that it is hardly to be wondered at that a sort of general paralysis is the result. So passive must the Froebelians become, if they are to follow that theory, that they must cease to have any influence over their pupils at all.

When we consider the bewildering paraphernalia of gifts and occupations in the Kindergarten, we are inclined to think that the Froebelians have hardly done justice to their principle of non-interference. The justification usually offered is that the various exercises have been discovered by experiment to be exactly the sort of thing that Nature demands, and that the teacher in applying his methods is, after all, only 'passive, following.'

It would be unfair to the system, and not to our present purpose, to argue from the fact that anything more unnatural than many of the practical applications of the principle, it would be impossible to find. The principle can hardly be held responsible for the rigid, and, therefore, irrational application made by unsympathetic teachers. Yet it is the responsibility of the pedagogue to maintain that a benevolent superintendence is too modest a name for the complicated system the Froebelians have now elaborated. The value of the Kindergarten is at issue, the question is—Can the 'passive, following' theory be made to be consistent with the system as now developed?

By observation it is found that children are fond of making things, of expressing thus their own ideas, of 'making the inner outer.' When the educator gives them the opportunity of exercising this power or gift, he feels that he is 'passive, following.' He is but the jackal that provides the meat. The eating is the part of the child. If the teacher is content with this function, nothing more need be said about Education as a mystery. Given a child and certain materials, it is found that a certain result is produced. This may be interesting as a fact in Natural History; it cannot be held to explain anything. The educator does not educate; the child is his own educator.

There is obviously a sense in which it is true that all education is self-education. No man can learn for another; no man can be moral for another. *-Jacobot's definition of teaching, 'causing another to learn,' has been discarded. Can the definition of Education, 'causing another to develop himself according to the laws of his own nature,' be defended? By the conditions of the case, the subject must develop somehow: the only point left for consideration, therefore, is, Can we modify this development so as to produce the best result possible for the case? This involves two distinct problems: First, we have to discover what the highest form of development possible in the given case really is. Secondly, we have to discover some means of attaining this form.

The first problem, as it is stated above, is insoluble. No doubt, were all the conditions of the case known, the highest form of development possible for the given subject would be at once evident. But such knowledge is absolutely beyond our finite minds. Viewed *sub specie aternae, the problem ceases to be a problem, and becomes a mere statement of fact. Unfortunately, this point of view is not attainable.

The case is not yet altogether hopeless. The second problem, which seems to depend upon the first for its very conditions, may itself supply the solution of the first. In working out its own development, the ego may indicate its own ideal, indeed must indicate that ideal. The important question that now arises is, Does it indicate that ideal soon enough for the educator to profit by the indication? Even if this question be satisfactorily answered, there remains the final problem, Can an external mind have any share in determining the development of a self-determining organism? To face the question fairly, we must give up all metaphors, however convenient. Above all, we must give up that wearisome acorn with its resulting tree. It has to be admitted that the tree is implicit in the acorn, and that a little discussion would set us in furthering the development of the oak; but a child is not an acorn; a man is not a tree. We may endow an acorn with life—organic life; we may, if we will, endow it with a sort of generalized consciousness; but in the case of the child there is something quite new, and much higher than the highest we can possibly attribute to the tree. The oak is, no doubt, as absolutely self-determined as an acorn. It is not consciously self-determined. The developing human being is not only self-determined, he is self-conscious.

How does this new element affect the case? Can external influences modify self-development characterized by self-consciousness in the same way as they modify self-development not so characterized? Manifestly they can, in a negative sense at least. The environment, conscious or unconscious, can and does interfere with the full and free process of self-realization. A force that can hinder may reasonably be assumed to be able to help, if only in a negative way. By means of withholding its aggressions one may be said to produce a positive effect; nature is clearly dependent on nurture. It must not be forgotten
that in the process of development there are two forces—an outer and an inner—the nature of the developing ego, and the nurture supplied; and any influence must differ according as it is allied to the one or to the other nurture.

We have the antagonism between two forces—the self-developing ego on the one hand, and the environment against which it strives on the other. It is in this dualism that the ego realizes itself, so far as it rises above the antagonism, and attains an ever higher and higher unity. If the educator is to exercise any influence at all, he must throw his force either with the ego or with the environment.

The natural thing is to throw in his influence with the struggling ego; but what is the result? Suppose that by his help a higher unity is obtained: how does the self-realizing ego fare? The unity thus attained may be real for the educator: it is empty for the struggling ego. This mistake in moral training is exactly parallel with the popular blunder in intellectual education. The blunder in question is the supplying of cut and dry definitions and rules, which certainly introduce order among the confused mass of presented ideas, but an order that is meaningless. The child, for example, is struggling for the understanding of the concept "Abstract Noun." There is a manifold of presented ideas. The teacher may give his child and dry definition which produces an appearance of order. This definition, which imposes a mechanical unity on the hitherto rebellious manifold, may be perfectly accurate, and may represent a real unity to the teacher. To the child it is a hindrance. No general principle can be of use to a child till he has worked for it, that is, till he has made it his own by rising above the antagonism of the particular facts he combines.

To seek to aid the ego, then, by directly helping it, is to weaken it. Even if we understand the idea the ego seeks to attain, we cannot directly aid it in its efforts, for in so doing we reduce the development below the level of conscious self-realization.

The place of the educator is, therefore, limited to the environment. He is but one element of the manifold against which the ego reacts. We must influence the ego by means of its limitations. If we can so modify the environment that the ego must react upon it in a determinate way, we seem to be able to influence the ego directly, and to restrict its power of self-development. Yet the very freedom which certain persons consider the limits of the laws according to which the organism develops itself. If the developing organism responded capriciously to given forces, it could not be said to be self-determined. A perfectly unlimited self exists to be a self at all, and loses all meaning.

If, then, the child answers the educator's stimulus exactly as the educator expects, it is because the nature of the child demands that reaction and no other shall follow this stimulus. It may be here objected that, if this be so, making is really possible. The child is clay in the hands of the potter. All the educator has to do is to discover the laws according to which the child develops, and apply this knowledge. To this a cheerful assent may be given. So far as the educator knows the laws according to which a child develops, so far is the child clay in his hands, to make of him what he will. Nor does this admission in the least endanger the independence of the child as a self-determining organism. The educator can make of the child whatever he pleases, so long as he abides by the laws of the child's development. The very freedom that marks the self-development of the child is the necessity which impels him to act as the educator leads him to act. The child realizes himself fully and freely in the environment that has been modified by the educator. No less freely and fully does the educator realize himself in the environment which he has modified.

Viewed from too close a standpoint, there seems here to be a distinct contradiction. How can a child be at the same time self-determined and determined? But we must remember that the contradiction disappears, and the two forces—the child ego and the educator ego—are seen to form parts of a wider organism in which each finds its only possible freedom in attaining a harmony with its surroundings—in acting thus and thus and not otherwise. If this be so, it may be asked, Why do educators as a matter of fact so often fail to obtain that determining power over their pupils? It is generally admitted that within certain narrow limits the educator does mould the character of the pupil as a potter does the clay; and, when the matter is looked into with any degree of care, we find that the powers are found to be limited by the bounds of the educator's knowledge of the laws according to which the pupil's ego is self-determined.

The objection of the loss of freedom of the child, whose nature is guided by the skilful teacher, may be met by the correlative objection of the loss of freedom on the part of the teacher. If the child must react in a fixed way to certain stimuli, he seems to lose his freedom; but what of the freedom of the educator? In order to modify in a given direction the development of a given organism, the educator must modify his own energies in a definite direction—must, in short, to some extent give up the freedom of his own development. There is here no fatalism. Educator and educated develop alike according to the laws of their being. The fact that a complete knowledge of the nature of the educated would enable the educator to modify the development in no way interferes with the free self-development of the educated. Such complete knowledge is admittedly unattainable. But, supposing it to be attained by the educator, he would by that very knowledge have ceased to be an educator. He would have risen to a point of view from which he could look with full comprehension upon both parties in the work of education. He would see that matter and pupil in their action and reaction upon each other are gradually working out their differences, and are attaining ever higher and higher levels at which certain processes of which certain persons consider the limits of the laws according to which the organism develops itself appear. What causes it to appear that the ego of the educator is dominating the ego of the educated is that the former always works from a slightly higher level. He cannot, indeed, rise to such a height as to be able to envisage at one sweep all the antagonisms and reconciliations that make up the entire sphere of education, but he is always working from a level high enough to resolve the immediate antagonism that makes up the now of education at any given moment.

Underlying all this is the great assumption of Idealism which we must be content to receive and to acknowledge as an assumption. We cannot transcend thought; we cannot prove the organic unity of the universe; but, if the universe be not a natural organism, if there be no reason underlying the manifold of experience, then philosophy has no meaning for us. If all the same, it must be admitted that these wide generalities, while showing that explanation is possible, that a system of education is within the grasp of complete knowledge, give little help in discovering the laws of the child's development. Within this rounded whole that makes up the Idealist's universe, we must begin our work somewhere. We must have a system that fits into the
limited area within which we live. Our practical method does not require to supply a complete explanation of its principles. The essential thing is that it shall not contradict any of the findings of the past, but, as it stands, it may be employed as an instrument for teaching.

To come down from the clouds—let us see how the thing works out. Given a newly-born child, how can the educator bring his influence to bear upon it? The faculty psychologist is at a loss. We must not talk of exercising the faculty of discrimination by changes of light and temperature. This exercise demands, he tells us, a rudimentary form of memory and judgment. And thus the building up of the ego proceeds. The whole process may be summed up in the one word 'training.' In modern educational works this word has acquired a sort of sacred meaningfulness. Few words labour under such a weight of assumptions. Naturally it is marked by a great deal of vagueness; but, as often as it occurs, it appears to connote a process that is peculiarly philosophical yet practical. Despite its ordinary vagueness it is not left without a fairly well-defined philosophical meaning. R. H. Quick, for example, would divide all educators into the three great classes: Realists, Humanists, and Trainers; and the school of educators who follow say that they differ according to whether they carry on the 'training.' If we have regard to the results of the process of education, this classification obviously implies a cross-division; for each of the schools claims to train its pupils, though they differ regarding the means to be used to accomplish the training. Without pressing the distinction too closely, it may be said that teaching lays stress on the knowledge to be conveyed, training rather on the process of conveying it, and particularly on the effect of this process upon the mind of the pupil.

Sometimes, indeed, a lower view of training is held. It is regarded as more or less physical. In his Introduction to the Pedagogy of Herbart (London, 1895), p. ix, we find Ufer saying:

"Animals cannot in any true sense be educated: they can only be trained. Education is an influence upon man. When a person is spoken of as well-educated, we do not think of bodily qualities. The educating influence has reference to the soul and concerns itself with the body only so far as the care of the latter is immediately serviceable to the former."

The very existence of the training school of educators is that this comparatively low view of training is not universal. Pedagogical education is not clearly an element of truth in it. At college there are trainers for the river, and tutors for the schools. As usual, whatever difficulty there is arises from a metaphor. The process represented by the word is carried over from the body to the mind. Fortunately there is more than the usual attenuated connexion between the two terms of the metaphor.

In the last resort physical training consists in teaching an animal to perform certain acts easily by making it do them frequently. Here it is the first step that costs. After the act has been performed once, there is little difficulty in having it repeated and concerned itself with the body only so far as the care of the latter is immediately serviceable to the former."

"The soul has no capacity or faculty whatever, either to receive or to produce anything" (Lehrbuch zur Psychologie, Leipzig, 1834, § 132). This startling statement does not block the way of the educator so completely as at first sight appears: for what Herbart takes from the soul he gives to the ideas; and whatever may be the metaphysical and psychological rights of the matter, the educational process does not suffer. It is sometimes objected to Herbart that his educational theories cannot be deduced from
his psychology; but as a matter of fact his educational theories were elaborated before his psychological studies, and there can be little doubt that the needs of education had a great deal to do with the peculiar form his psychology took. Carried out in its logical issue, the Herbartian system of education implies the possibility of man-making not only on the intellectual but also on the moral side. As Locke demolished the theory of innate ideas, so Herbart demolished the theory of innate faculties. His educational system may not unfairly be said to be a process by which faculties can be supplied. His evolution of the will from the conflict of ideas really amounts to the creation of the will by circumstances if no educator deliberately interferes, or by the educator if there be one who cares to modify the interaction of the conflicting ideas. If, as Herbart maintains, Action generates the will out of desire, there is evidently room in education for a more effective application of the maieutic art than even Socrates ever imagined.

The applications of the Herbartian metaphysic and psychology are untenable, but the educational applications are in themselves very useful, and are really not involved in the condemnation that their supposed foundation deserves. Herbart distinguishes between the rule and the instruction, the distinction depending upon the nature of the connexions involved in the subjects taught. Those subjects which touch human life at the greatest number of points form the best kind of Gesinnungsstoff, as he names the material for educative instruction. In estimating the value of the Herbartian system, the mistake is commonly made of attaching too much importance to the pupil's intellectual qualities sometimes even to the exclusion of the moral, though, as a matter of fact, the moral side bulked very largely in Herbart's mind. No doubt Herbart does attach very great importance to Knowledge as an educational organon, but no competent critic can read his educational work without at once seeing the moral implications of the system. The whole value of instruction, indeed, from Herbart's point of view, consists in its moral bearings. So far does he go in this direction that he has given rise to a great deal of indignation by his well-known saying, 'The stupid man cannot be virtuous.' A view which he qualified by adding, 'It must be clear that he did not mean the word stummpfigzig to be understood as referring to capacity, but rather to the use made of capacity, though it has to be admitted that the word implies something he could not have chosen to convey this meaning. He is continually emphasizing the need of supplying the mind with healthy ideas in order that a full life may be possible. We are too apt to set up a purely negative ideal of virtue. Our favourite moral axioms consist of prohibitions. Herbart is more inclined to demand positive goodness. His advice is not so much 'Avoid evil' as 'Do good.' The dull unstoried man cannot be virtuous because he has not made the most of himself. He is not what he might have been. Ignorant nulla cupido, quotes Herbart, and the remark applies to good as well as to evil. All temptation in the last resort comes from within. We have here the psychological explanation of the saying, 'To the pure all things are pure.' The 'circle of thought,' by which Herbart means the organized content of the mind, determines the character of a man. If all Herbartianism could be gathered up into one sentence, that sentence would be: 'The will has its root in the circle of thought.'

The argument the great need of the Science of Education is a synthesis of the Herbartian and Froebelian systems, and signs are not lacking that such a synthesis is well within sight. Each supplies the defects of the other, each corrects the other's errors.

3. History of education. - From a certain point of view the history of education is the history of the development of civilization. All moral and intellectual progress results from educational processes that need not, however, be conscious processes. At the earliest stages of civilization, Education is inseparable from ordinary acts of intercourse. The child is educated by the mere process of living. He learns by the reactions on his environment, and particularly by imitation, both in its positive and in its negative form. It is true that parents and other adults do at this stage give a certain amount of instruction to the growing child; but all this instruction is given with an immediate and definite aim, and has no intentional relation to the development of the character of the child. True education begins when the community attains to a sort of collective self-consciousness, and, as it were, turns itself back upon itself and takes itself into its hand, with the deliberate intention of guiding development. The mere existence of schools is no proof that there is any attempt at education. These may exist only as a means of imparting a certain dexterity that will increase the value of the individual to the community, or to some section of the community.

Since religion was the first of the social forces that led to a special organization, it is very natural that it should be the first to see the need of education. To secure the proper observance of religious rites, it was essential that there should be a body of skilled priests, and this body could be maintained only by a system of carefully selecting and training young men to take the place of those who succumbed to age or disease. Experience would show that the earlier the training began, the more effective it proved, so what began as a professional college gradually developed a sort of preparatory department. Two influences would at once begin to act in such a way as to keep the school and the college distinct. First, the priests would come to regard the school as an excellent means of sifting out all the characters that gave promise of proving good subjects for the religious life. It was obviously desirable, therefore, to mark off the school from the college by means of certain rites that came to be essential to the priestly whole makes it part of the community. In the second place, it would soon be found that pupils who had gone through the school had benefited by the training, even though they had not been deemed worthy to enter the college. A desire would accordingly arise among the more ambitious parents that their children should share in the advantages of the school, even though there was no desire that they should take up the religious life. This tendency would be strongest where the Church was most powerful, and where the lay nobility was weakest. The connexion between the Church and Education is maintained throughout the ages, though the nature and the connexion varies according to the spiritual state of the Church. When the Church was pre-eminently a political organization, the schools became little better than technical colleges, preparatory to the clerical profession. When the Church reached a high spiritual level, the schools gave their attention to human beings in general, and became places to fashion the raw material of humanity into its noblest forms, literally officine hominum.

Of the history of Education among the primitive races we know very little with certainty. The only point that is quite clear is that Education took a form in each case determined by the prevailing ideals of the race. Caste in India,
Tradition and Ancestor-Worship in China, Dualism in Persia, Practical Common Sense in Egypt, all leave their mark on the kind of education adopted, and the lines along which it was developed. The Theocracy among the Jews, with its consequent emphasis on the individual, resulted in a wide-spread popular education, which was fundamentally moral and religious, but did not neglect the purely literary side. From the Old Testament to the Catechism, most among the Hebrews as a nation a knowledge of reading and writing was wide-spread, and in this respect they stand out in a most favourable light compared with their contemporaries. See Education (Jewish).

With the Greek States, we enter upon a new phase of the history of Education. Not only do we have written records of the actual state of education at the time, but we have more or less detailed discussions of the theory of education and of educational ideals. Among the Greeks generally, the individual was entirely subordinated to the State, the man was lost in the citizen. The subjects taught were classed under the two heads, Moralia and Naturalis, of which the first included literary and physical training. For it must be remembered that Music among the Greeks included not only what we understand by that term, but also that which we call the aesthetic. The study of Music involved a knowledge of reading and writing and the literary arts generally, though, of course, these arts were cultivated in very different degrees in the different Greek States. Among the Athenians, for example, Gymnastics meant mainly the training necessary for war, and Music was limited to the attainments that gave a charm to the orgies they loved. The Spartans had higher ideals; but even among them the training which was to give skill and endurance in warfare. The literary training was confined to the three R’s, and some warlike Music. It is difficult to say under which head the peculiar educational subject of Lycyus is to be placed. Probably this form of training in dexterity and cunning is most fitly classed as Gymnastic. The training of citizens fell naturally into four periods: childhood at the mother’s knee up to 7 years of age; boyhood up to 18, during which period the boys were at public training schools, but each had to have some grown man as his special friend and trainer; youth up to 30, during which time the young men were trained in the practice of war; marriage at which time they were either made soldiers or were married. It is to the credit of the Spartans that female education was fairly well organized in their State. Among the Athenians, the literary side received more attention, though Gymnastic retained its prominence, the recognized physical exercises being now grouped together in the pantothem: running, leaping, quoit-throwing, wrestling, and boxing. The wider life of Athens, and the influence of the foreign element there, favoured the development of individualism. In his great educational work, The Republic, Plato sets himself to combat this individualism, and constructs a system in which the best elements of the actual Spartan and Athenian education are worked up into a system in which the individual is again overshadowed by the State. The Sophists, who against whom Socrates was never tired of girding, were teachers rather than educators. They professed to communicate a certain amount of valuable knowledge rather than to form character. See Education (Greek).

The Tu-PROFESSORS were the most famous in Rome, which owed most of its culture to Greece. Among the Roman teachers were some notable men who deserve to rank as genuine educators. Chief of these is Quintilian, who, though his book professes to limit itself to the training of an orator, gives us a treatise on Education which Professor Larrieu is inclined to regard as the best ever written. The Public Schools of Rome were secular and political, rather than religious; but with the introduction of Christianity a new system of education was established by the Church which was, perhaps, the main object of which was to enable converts to understand the new religion, and, if occasion favoured, to promulgate it. Hence arose the Old Testament, and, side by side, and by, the establishment of permanent places of worship led to the appearance of Monastery and Cathedal Schools, which were able to carry on the work of education after the fall of the Roman Empire. In the time of Charlemagne we find the value of Education recognized in the existence of a famous institution known as the Palace School. This was an itinerant institution which accompanied the Comtis in its wanderings, for the purpose of providing a suitable education for the sons of the nobility. Though probably not founded by him, it certainly attained its fame mainly through the intelligent patronage of Charlemagne. This is also the time of the famous Capitation of 787, probably drawn up by Alcin, then Master of the Palace School. This is a sort of general order sent to all the abbots of the monasteries, and involved a knowledge of reading and writing, and his instructions regarding it. It has been described by Mullinger as ‘perhaps the most important document of the Middle Ages,’ and by Amsper as ‘the charter of modern thought.’

The subjects taught in the medieval schools formed the seven liberal arts. They were divided into two groups, named respectively the Trivium and the Quadrivium. The ‘trivial’ arts were Grammar, Rhetoric, and Arithmetic, and the ‘quadrivium’ Geometry, Arithmetic, Astronomy, and Music. These seven arts were held to include all that was worth knowing in the mediæval world. The first reference to the seven liberal arts, as matter of study or discipline, has been traced to Varro, but the credit of dividing them into the two groups is claimed for each of two writers—Augustine, and a certain Carthaginian named Martinius Capella. The truth probably is that Augustine made the distinction, while Capella, by his more picturesque style, called attention to and perpetuated it.

Universities, what they were or were not founded; they really founded themselves; they grew out of the nature of things. The tendency of learned men to gather together for mutual help led to a process of segregation in suitable districts. No doubt in many cases favourable centres were found at certain schools connected with Cathedrals or Abbeys. In most cases the Cathedral School proved more attractive to learned men in search of intellectual freedom than did the Abbey School. A University was originally known as a studium publicum vel generale, but this phrase does not occur frequently till about the end of the 12th century. The first reference to a school in which the students from one district or one country, hence the charter of a University had to come from one who had an authority recognized in different kingdoms. The only two such authorities in Europe are the Pope and the Emperor. To these, therefore, it became customary to apply for a charter to establish a new University, though some of the oldest and most famous Universities never had any charter, but claimed and exercised the privilege of granting to their graduates the jus ubique docendi.

172 EDUCATION (Introductory)
The 

did not, as a matter of fact, at first confine themselves to language, but rather treated language as a means of expressing human aspirations. Painting, Music, Sculpture, Literature, and all that had a direct bearing on human life and action formed the matrix with which the Humanists dealt. It is only when the Humanistic view is carried to excess that it leads to the pedantry associated with the mere language drill condemned by Carlyle under the name of gerund-grinding.

(1) Among the most distinguished Humanistic educators was Vittorino da Feltre (1378-1446), a schoolmaster at Mantua, who exercised a very considerable influence on education in Italy. John Sturm (1507-1589) was the master for many years of a famous grammar school at Strasbourg, where he elaborated a procrustean system of instruction, in which the amount of work for each year was absolutely regulated, so that to exceed the amount prescribed was to be severely punished; in fact, to fall short of it. By his pedantry Sturm did a great deal to obscure the real merits of Humanism. The English Humanist, Roger Ascham (1515-1569) and Thomas Nashe (1567-1601), who wrote a better form of Humanism, and it has been remarked that it would have greatly benefited the education of Europe if the example of Mulcaster had been followed instead of that of Sturm. When

the Jesuits saw the political importance of education, and deliberately set themselves to become the teachers of the governing classes of Europe, they founded most of the higher faculties in addition to the Arts faculty, which in those early times corresponded really to a preparatory course for one of the three higher—

The

Parallel with the education of the Monastery, the School, and the University, was that of the Castle, where, instead of the seven 'liberal' arts, were taught the seven 'fine' arts—Horsemanship, Riding, Shooting, Hunting, Swimming, Boxing, Chess-playing, and Verse-making. The contrast between the free and the liberal arts emphasizes the weakness of the Trivium and the Quadrivium— their unwholesome aloofness from the affairs of everyday life. The medieaval scholars, as scholars, held themselves jealously apart from the common things of life; they lived in a world of their own, in a world of abstractions. When we consider that for nearly five centuries the finest intellects of Europe were applied to the discussion of the question of the relation of the general to the particular, we can understand the peculiar intellectual atmosphere which pervaded the world of thought. On the educational side the Renaissance manifested itself in a revolt against this arid scholasticism. The charge of bookishness is sometimes made against the Renaissance education, and it must be confessst that in some of its developments it afterwards yielded to the tendency towards abstraction which is inherent in most forms of teaching. But on its first appearance the Renaissance education valued books mainly for their contents and their general style. It was a later generation that fell into the slough of 'scholarship' and grammatical pedantry.

By the time of the Renaissance the writers and thinkers on educational questions had developed their subject so much that different schools of thought have to be recognized among them. A triple classification is frequently made, the divisions being into Humanists, Realists, and Naturalists. The distinction is based largely upon the nature of the material upon which the mind is exercised as a means of training. The Humanists are those who prefer language and other specially human functions on which to nurture their pupils. They did not, as a matter of fact, at first confine themselves to language, but rather treated language as a means of expressing human aspirations. Painting, Music, Sculpture, Literature, and all that had a direct bearing on human life and action formed the matrix with which the Humanists dealt. It is only when the Humanistic view is carried to excess that it leads to the pedantry associated with the mere language drill condemned by Carlyle under the name of gerund-grinding.

The most distinguished Humanistic educators was Vittorino da Feltre (1378-1446), a schoolmaster at Mantua, who exercised a very considerable influence on education in Italy. John Sturm (1507-1589) was the master for many years of a famous grammar school at Strasbourg, where he elaborated a procrustean system of instruction, in which the amount of work for each year was absolutely regulated, so that to exceed the amount prescribed was to be severely punished; in fact, to fall short of it. By his pedantry Sturm did a great deal to obscure the real merits of Humanism. The English Humanist, Roger Ascham (1515-1569) and Thomas Nashe (1567-1601), who wrote a better form of Humanism, and it has been remarked that it would have greatly benefited the education of Europe if the example of Mulcaster had been followed instead of that of Sturm. When

the Jesuits saw the political importance of education, and deliberately set themselves to become the teachers of the governing classes of Europe, they founded most of the higher faculties in addition to the Arts faculty, which in those early times corresponded really to a preparatory course for one of the three higher—

The

Parallel with the education of the Monastery, the School, and the University, was that of the Castle, where, instead of the seven 'liberal' arts, were taught the seven 'fine' arts—Horsemanship, Riding, Shooting, Hunting, Swimming, Boxing, Chess-playing, and Verse-making. The contrast between the free and the liberal arts emphasizes the weakness of the Trivium and the Quadrivium— their unwholesome aloofness from the affairs of everyday life. The medieaval scholars, as scholars, held themselves jealously apart from the common things of life; they lived in a world of their own, in a world of abstractions. When we consider that for nearly five centuries the finest intellects of Europe were applied to the discussion of the question of the relation of the general to the particular, we can understand the peculiar intellectual atmosphere which pervaded the world of thought. On the educational side the Renaissance manifested itself in a revolt against this arid scholasticism. The charge of bookishness is sometimes made against the Renaissance education, and it must be confessst that in some of its developments it afterwards yielded to the tendency towards abstraction which is inherent in most forms of teaching. But on its first appearance the Renaissance education valued books mainly for their contents and their general style. It was a later generation that fell into the slough of 'scholarship' and grammatical pedantry.

By the time of the Renaissance the writers and thinkers on educational questions had developed their subject so much that different schools of thought have to be recognized among them. A triple classification is frequently made, the divisions being into Humanists, Realists, and Naturalists. The distinction is based largely upon the nature of the material upon which the mind is exercised as a means of training. The Humanists are those who prefer language and other specially human functions on which to nurture their pupils. They did not, as a matter of fact, at first confine themselves to language, but rather treated language as a means of expressing human aspirations. Painting, Music, Sculpture, Literature, and all that had a direct bearing on human life and action formed the matrix with which the Humanists dealt. It is only when the Humanistic view is carried to excess that it leads to the pedantry associated with the mere language drill condemned by Carlyle under the name of gerund-grinding.

(1) Among the most distinguished Humanistic educators was Vittorino da Feltre (1378-1446), a schoolmaster at Mantua, who exercised a very considerable influence on education in Italy. John Sturm (1507-1589) was the master for many years of a famous grammar school at Strasbourg, where he elaborated a procrustean system of instruction, in which the amount of work for each year was absolutely regulated, so that to exceed the amount prescribed was to be severely punished; in fact, to fall short of it. By his pedantry Sturm did a great deal to obscure the real merits of Humanism. The English Humanist, Roger Ascham (1515-1569) and Thomas Nashe (1567-1601), who wrote a better form of Humanism, and it has been remarked that it would have greatly benefited the education of Europe if the example of Mulcaster had been followed instead of that of Sturm. When
modifying public opinion on Education than any other publication of the Victorian period.

(3) The Naturalists lay less stress on the more subjects to be taught, and more upon the training supplied by nature itself, so much so that, or the other subject as to bring the pupil into direct contact with life at the proper points, and thus enable him to work out his own education. Instruction is not so much a matter of sticking to the natural approach, as the name itself. The Naturalist, like Locke, feels that the only thing, nor even the most essential thing. The first Naturalist may be said to be Rabelais (1483–1553), who, as soon as he had escaped from his monastic existence, set himself in his own time and moments to the study of the possibilities of education in producing the kind of man that the world requires. His attitude is largely destructive, though in his Éducation (a well-endowed and well-trained youth used as a contrast to Gargantua) we find the ideal at which we ought to aim; and in certain passages we get fairly clear hints towards the method of attaining that ideal. The second Naturalist is More, perhaps less methodically, who in the learned leisure of an easy life set himself to develop his theories of what education should be. Locke (1632–1704), on the other hand, went out of his way to publish a somewhat unmethodical and easy-going essence under the title of Essay on Education. In this we have the fruits of the observation of the medical man, the private tutor, and the philosopher. What the book lacks in system is more than made up for by its practical common sense and by its suggestiveness. J. J. Rousseau (1712–1778), in his pedagogical story of Émile, presents probably the most influential work on Education that has been written in modern times. He believes that man is good and has been corrupted by civilization. The cry of the book is therefore to ‘back to Nature.’ The educator must learn to lose time wisely, and to keep himself in the background, letting the educand develop in his own way. All initiative is to come from the pupil. Fichte (1762–1814), so far as he can be classified at all, must be ranked with the Naturalists. His claim to special notice is his famous Rede on die deutsche Nation, in which he deliberately set forth the claims of education as a regenerator of nations.

Goethe (1749–1832) treated of Education as he treated of almost everything else. His contributions in this section of the educational province in Wilhelm Meister. This marks him out as Naturalistic. It was formerly customary for every German professor of Philosophy to deliver a course on Education, so much so that the best known German writers on Philosophy have written something on the subject, Kant among others. At the present moment there is a prolific literature on educational subjects. While each country contributes to the general problem, each has acquired a specific character by emphasizing some aspect. Thus in the United States, Child Study and the relation of education to social life have received the highest attention, and education has done exceptionally good work in tracing out the relations of temperament to education. In France, too, the educational applications of ‘Suggestion’ are best developed. Germany is specially strong in dealing with the psychological bases of education, but has also given a great deal of attention to the methodological aspect, particularly in connexion with the relation between the Froebelian and the Herbartian Systems. In Great Britain there is less interest in the philosophical bases, and the subject is usually treated in a more or less empirical way.

Literature.—G. Stanley Hall and John M. Mansfield, Educational psychology and description of the Psychology of Education (Boston, 1890); W. S. Monroe, Bibliography of Education (New York, 1897). There are naturally a strong American reference to Thorndike’s Studies of Lectures on the History of Education (New York, 1901) is useful. In National Education (London, 1901), Laurie Magnus gives a very useful Bibliographical Note. There is an extensive work on the contents of the various Educational Libraries, such as the Board of Education Library at the Whitehall Office (1826–1876), the College of Physicians, Guild Library. There are some more or less commercial publications, such as the Schüler durch die pädiatrische Literatur (Vienna, 1879), that are of much general utility. Of Educational Encyclopedias the following are the most important: Kiddle and Scripture’s Encyclopedia of Education (New York, 1874); Schnechel, Cyclopaedia of Education (London, 1892); F. Buisson, Dictionnaire de pédagogie (Paris, 1898). Wilhelm, in his Handbuch der Pädagogik (Langenmuller, 1902), this great work in seven large volumes is excellent. For a more popular work on the whole history of Education, see the Educational History (Paris, 1894). The most comprehensive History of Education is the Geschichte der Pädagogik of K. v. Rümpler (Gütersloh, 1896), and the Geschichte der Bildung und Kultur of K. Schmid (Königstein, 1876). Of a more popular character is the Histoire de la pédagogie of Gabriel Coypuy (Paris, 1885). Both Rümpler and Coypuy appear in English translations. Friedrich Paulsen’s Geschichte des gelehrten Unterrichts (Leipzig, 1839) is now a standard work. The Herbartian controversy is admirably treated by H. Hayford in his The Critics of Herbartianism (Lon- don, 1879). The chief writers on the Herbartian side are: P. W. Dörpfeld, Denken und Gedächtnis (Gütersloh, 1901); T. Zeller, Grundzüge zur Lehre von der erworbenen Unterricht (Leipzig, 1884); K. H. Leopold, Outlines of the Educational History of England (London, 1896). The ‘critics’ of Herbartianism are represented by H. W. Wilamowitz, Die Schule der ersten Schuljahr (Vienna, 1880); E. S. Sallwärth, Gesinnung und Bildung (Langenmuller, 1897); O. Hubatka, Geschichte der Schulpflege in den letzten Jahrhunderten (Berlin, 1899); Angust Vogel, Herbart oder Pataloczky (Hannover, 1898); P. Natkar, Herbart und Pataloczky, und die daraus resultirenden Lehren (Stuttgart, 1899). A good general book is P. Monroes Text-book in the History of Education (London, 1863). The best work on the education of the French writers is L. L. B. Schem, Éducation des néologismes (Paris, 1888). Among the French writers who have most affected the Science of Education, without directly writing upon it, are: Alphonse Fontame, Temporale et caractère (Paris, 1893); Fr. Paulian, L’Activité mentale (Paris, 1896), and Les Caractères (Paris, 1902); G. Tarde, Les Lois de l’imitation (Paris, 1896). In which there is a large and rapidly increasing literature on the subject. Herbert Spencer’s Education (1861); A. P. Leach’s English Schools at the Reformation (London, 1890); W. T. Harris’s Psychology Foundations of Education (New York, 1908); S. S. Laurie’s Institutes of Education (Edin., 1909), and M. C. Ware’s Manual of the Testing (London, 1905), are probably the works that have produced most effect on educational opinion. Educational theory, as any becoming consensus of opinion, are in such works as P. E. Henderson’s Text-book in the Principles of Education (1910), and P. E. Henderson’s Principles of Education (1911). The Great Educator Series (Heinemann) and the International Education Series (Appleton) contain some excellent contributions. J. Adams.

EDUCATION (American).—1. Primitive teachers.—As elsewhere throughout the world, the teachers of children among the American Indians include the father, who early instructs his sons in the arts and activities which more especially concern the male half of the tribe; and the mother, who in like manner teaches her daughter the domestic activities and industrial arts belonging to women. The grandfather and the grandmother are also teachers, particularly of the mythic lore, tribal legends, wealth of story and proverb; and often certain other aged men and women devote themselves more or less completely to giving such instruction, so that they are practically professional teachers, such as we have to-day. The medicine-man, or shaman, appears likewise as teacher, often in connexion with secret societies, for admission into which children are prepared at an early age. The Indian tribes in which the members of society who live in savage and barbarous peoples refrain from killing
prisoners only to enslave or to debanch them. Even as
The great Ethiopian conqueror bid spare
so many an uncivilized tribe spared the teacher
visited the ground (Milton, Sonnet viii.),
Went to the ground (Milton, Sonnet viii.).
their wild turleneance of strife. Woman's rôle
as the mother and disseminator of many forms of
primitive culture, from ceramic art to the
mysteries of religion, caused her, even in very
remote ages of human history, to be thus spared;
somehow more than when she was the apostle of the
darker side of knowledge, she was feared rather
than loved for her skill and cunning. J. W.
Fewkes tells us that, when, in 1700, the Indians of the
Pueblo of Oraibi, in New Mexico, took and
destroyed the Pueblo of Awatobi (both settlements of the
Tussyan people), the conquerors 'spared all
the women who had song-prayers and were willing
to teach them.' Among those saved was the
Ma-zrau-moof-sei, or chief of the Ma-zrau society, who
declared her readiness to 'initiate the women of
Walpi in the rites of the Ma-zran'; and it was in
this way that the observance of the ceremonial
knowledge of how to do Ma-zran came to us. We learn
further that 'some of the other Awatobi women
knew how to bring rain, and such of them as were
willing to teach their songs were spared and went
forth to valley villages.' The learning of men, too,
made them more exposed to tribal wars than
women, not always so conspicuously as was the case with
women. At the same conquest of Awatobi,
the Oraibi chief saved a man who knew how to cause the peach
to grow, and that is why Oraibi has such an abundance of
peaches now. The Mi-got-i-tu-vi chief saved a prisoner who
knew how to make the sweet so-ri-se (small-eared corn) grow,
and this is why it is more abundant here than elsewhere.2
Captive women who married their captors have often
been not merely teachers of individuals, but of families, clans, and even tribes. They have in
not a few cases influenced the social customs and
the religion of the peoples among whom their new
lot was cast.
(b) The pedlar.—The pedlar, who survives now
only in the more backward of our modern civiliza-
tions or on the fringes of the more advanced cultures of
to-day, still retains traces of his former import-
ance as an educator. He has often been quite as
noted for his dissemination of intellectual wares as
for the distribution of creature comforts or other
material things. As O. T. Mason well says,
'Itinerant peddlers and tramps have marched about the
world and spread truth and knowledge; they have
embraced and wrecked. These have transported things and ideas and words.
They have set up a kind of internationalism from place to
place.'
These itinerant primitive 'tradesmen' are to be found among the American aborigines, where they
served as dispensers of knowledge, distributors of
tales and legends—in fact, as teachers of a great
variety of human lore.
(c) The stranger and the foreigner.—Among
primitive peoples the stranger is often welcome,
not because he brings with him good luck, fine
time and weather, and the like, although such things also
cause him to be happily greeted, but because he is
a bringer of news. This characteristic is noted
also among civilized races, particularly where they
inhabit regions more or less cut off from the cul-
ture-centres of the world. Here the stranger really
takes rank as an educator, being an important
source of information and the direction of knowledge of all
sorts. Westermarck says: "Do not the ancestors
in the remote forests of Northern Finland was con-
stantly welcomed with the phrase, 'What news?'"3
It is by no means true, as is often believed, that
all or many uncivilized peoples are utterly
averted to receiving knowledge from outside their
own tribal bounds, and look with disfavour on any
practical recruiting of their own intellectual re-
sources from foreigners or strangers within their
gates. In fact, probability, however; races, like
individuals, have differed widely in their sense of
receptivity, and in their attitude towards the
exotic in all fields of human activity—mental,
and social, and religious. What is true to-day of
 civilized races in this respect is true of the
uncivilized peoples now existing, and we are
justified in believing the same of their ancestors
of the earliest human times. Heterophilia and
heterophobism have been characteristic of the
races of man's progress, from prehistoric 'savage' to
the culture of the twentieth century. Nor has the
most progressive of modern nations exceeded some
primitive peoples in eagerness to receive and absorb
the new, the strange, and the foreign. Indeed,
the same people, race, or even tribe may contain
within itself these two diverse types, the neophobes
and the neophiles—those who hate and those who
love the new.
—Some Indian tribes, like the Kutenai, e.g., have
few, if any, secret societies and kindred social
institutions; but with many other aboriginal peoples of America these abound, and children
are carefully prepared for membership in them. These
societies are of various sorts—social, political, re-
ligious, and are in many of the tribal ceremonies and
dramatic performances of the Indians, children
have their regular roles, for which they receive
development at the hands of their elders. As in some
other parts of the globe, the advent of manhood
and womanhood (see art. puberty) is prepared for
by much instruction of the young in special ways,
among various American Indian peoples. Mar-
rage, likewise, among many tribes has certain edu-
cational pre-requisites. Among the Apache, one
of the principal tribes of the Siouan stock, Miss
Fletcher informs us (27 RBEW [1911], p. 330):
"In olden times no girl was considered marriagable until she
knew how to dress skins, fashion and sew garments, embroider,
and cook. Nor was a young man a desirable husband until he
had proved his skill as a hunter and shown himself alert and
courageous."
3. Educational processes, institutions, etc.—
The scope and general character of education among the American aborigines are thus described
by Mason (Indian, Amer. Ind. i, [1907] 414):
"The aborigines of North America had their own systems of
education, through which they were instructed in their
coming labours and obligations, embracing not only the whole
round of economic pursuits—hunting, fishing, handicraft, agri-
culture, and household work—but speech, fine art, customs,
economic, social obligations, and tribal laws. By unconscious
absorption and by constant instruction the boy and girl became
the accomplished man and woman. Modes of praise or blame,
the stimulus of flattery or disapprobation, wrought constantly
upon the child, male or female, who was the charge, not of
the parents and grandparents, but, in one or the whole tribe.
Loedek (Mission of United Brethren, Lond. 1794, p. 129) says
the Iroquois are particularly attentive to the future of the
young people for the future government of the state, and
for this purpose admits, that generally the choice of the
principal chief, to the council and council-fist following it.
The Eskimo were most careful in teaching their girls and
boys, setting them to work in all the staple industries,
hunting, showing them how to solve them, and asking boys how
they would meet a given emergency. Everywhere there was the

EDUCATION (American)

closest association, for education, of parents with children, who learned the names and uses of things in nature. At a tender age they played at serious business, girls in needlework, and boys in hunting, fishing, and gathering. Children were furnished with appropriate toys; they became little basket makers, were taught to make tools, and to understand the use of many common things, the rocks, the range of instruction being limited only by their capacity. Their efforts were praised, and their success was rewarded, but they were also disciplined, and this discipline was administered freely. In Florida, knowledge was deemed to be of little use to the ignorant, but the religious ceremonies of primitive peoples often contain sections that are directly pedagogical. Such, e.g., are the 'parables' of the Pawnee Indians, concerning which Miss Fletcher, who has penetrated some of the innermost secrets of the American aborigines, says (Indian Story and Song, p. 30):

'...Through an elaborate ritual and religious ceremony of the Pawnee tribe are little parables, in which some natural scene or occurrence serves as a teaching to guide man in his daily life. The words of the song are purposely few, so as to guard the full meaning from those not initiated in the ceremony, but the priest to hold the interpretation as a part of his sacred treasure...'

They are sufficient, however, to attract the attention of the thoughtful; and such a one who desired to know the teaching of the sacred song could first perform certain initiatory rites, and then learn the meaning of the words by the priest, which is 'a prayer for children, in order that the tribe may prosper and be strong, and also that the tribe may live, enjoy plenty, and be happy and at peace.' A Pawnee ceremony celebrated in the spring when the birds are mating, or in the summer when the birds are nesting and caring for their young, or in the fall when the birds are flying, but not in the winter when all things are quiescent' (A. C. Fletcher, in J. R. R. B. J., vol. 2, pp. 29, 30, f.), there are a number of these "parables.'

In these 'parables,' or brief-versed songs, as interpreted by the Kainuk, the genius of the Pawnee Indians, as we may term the high-minded and thoroughly human 'priest' of this tribe, who revealed to Miss Fletcher the true religion of his people, his fathers, we get a glimpse into the mind of the aboriginal American in one of its most instructive moments.

Among the Pawnee (as recorded by G. A. Dorsey, Pawnee Mythology) are: making fun of poor children by rich ones, making fun of or maltreating animals, betraying friendship, meddling with ceremonial objects, quarrelling with children (especially among brothers), wandering away from home, too great pride, needless sacrifices to the gods, false reports of buffalo in sight, etc. Things approved and recommended are: respect for poor boys on the part of rich girls, belief in success through continued effort, hope of greatness and power being attained, obedience to and reverence for the gods, taking care of one's clothing, attention to things while travelling, friendship among young men, high aims in life, marriage of the maiden of one's choice, kindness to birds, listening courteously to everything but not believing all one hears, recognition of the fact of being such a great man, and that a prophet is without honour in his own country.

It was upon such devices rather than upon formal punishment (see Other Punishments) that the American aborigines relied for the ethical results of manhood and womanhood.

LITERATURE.—Besides the material on the American Indian found in the usual works of missionary and ethnological writers, considerable material is to be found in various books on American literature, and in the numerous ethnological publications of the Field Museum of...
Chicago, the University of Pennsylvania, Harvard University, the University of California, etc., the following may be cited:

To the two or three centuries of the Maccabees of India preserved, Fa-Hian, was absent from home in the early part of the 5th cent. for a period of fifteen years, visiting the sacred sites of Buddhism. He remained in two or three monasteries in Patialajura (Patna) and Tampalik (Tamluk), and spent two years also in Ceylon. In all these places he occupied himself in study, and secured copies of Sanskrit and other sacred texts. Many of the monasteries were large, containing 600 or 700 monks; and he describes how students resorted to these centres of piety and learning in search of truth. In Northern India, by which is meant the and adjacent districts, Fa-Hian found that all the instruction was oral, and the rules of the various Buddhist schools were transmitted only by word of mouth. Further to the east, however, the monasteries reserved written copies of the Vinaya, the Sutras of the schools, and also the Abhidharma. The utmost freedom appears to have been permitted to him in every place, every facility being afforded for study and the copying of the manuscripts. Some of the Buddhist books he is said to have himself translated into Chinese after his return to China. There is also in his narrative a single passing reference to Lollard or Nalanda, the site near Gaya of the Buddhist monastery of Ceylon. The later years was so widely renowned. In Fa-Hian's time the place had apparently not yet attained the greatness or importance which subsequently belonged to it. He refers to it as a village and yajlena east of Rājagriha, and the birth-place of Sāriputra, where also he died and was buried; but he makes no mention of the presence of monks or a monastery.

About two centuries after Fa-Hian a second and more famous Buddhist monk from China, Huien Tsang, visited India, and during a period of sixteen years (c. A.D. 629-645) travelled widely in Central Asia and the northern parts of India, returning home, at the close of his wanderings, by land across the continent without seeing the monasteries of Ceylon or the south, of which he gives a merely hearsay account. During the interval of two centuries there had been frequent intercourse and exchange of visits between India and China, but no record of the experiences of the travellers appears to have perished.

The most striking feature of Indian religious life, as Huien Tsang found it, was the revival of Brahmanism, and the growth and extension of the

**Record of Buddhist Kingdoms**, ch. xxviii. Real identifies Nāla or Nālo near Shanghai as the site where Sāriputra was born (see Buddhist Records of the Western World, i. p. 118, ii. 177).
Mahāyāna school of Buddhism accompanied with a decline in numbers and influence of the Hinayāna monasteries of both sects, however, existed, some with as many as a thousand resident monks, engaged in the study of the law and the discussion of questions of religion and philosophy. For example, at the Golden Hill (Hiranyavārāva), a city on the Ganges, there were ten saṅghārāma, with about 4000 priests, belonging for the most part to the Sāmanīyas sect. Nevertheless, there were also, at Patalalaya, also, there were about ten monasteries with 1000 monks; and similarly in many towns of which he makes mention. Hiuen Tsang further records, as Fa-Hian had done, the continual movement of students from all parts of India to these centres of learning and interest.

The most important and flourishing school of Buddhist learning, however, was at Nalanda, identified by Cunningham with the modern village of Barāgōn near Gaya, about nine miles from Rājgir. Here there existed an ancient saṅghārāma, or monastery, built in memory of the Buddha, which had made the place his capital in a former life. It contained an imposing assembly hall and temple, and was maintained out of the royal revenues, in which were several thousands of monks, of great distinction and fame, belonging to the eighteen principal Hinayāna sects. In the evening and after the morning meal, they were wont to listen to the study of the sacred books and the discussion of religious questions. Learned men from different cities resorted in large numbers to the schools of Nalanda for study and the resolution of their doubts and questionings. And the name itself was held in honour far and wide.

It is a proof of the intensive character of this love of learning, as well as of the power and influence of Buddhism, that Hiuen Tsang reports the existence of a great monastery only about twenty miles west of Nalanda, with a thousand priests studying the Mahāyāna, the resort of scholars and learned men from distant countries.

In Central Asia also, Buddhism was possessed of a wide-spread influence. The devotion to learning and to the copying and study of the sacred books seems to have maintained itself for a considerable period. In his recent travels in the districts bordering upon China on the west, M. Aurel Stein found that the name and memory of the Chinese monk were still known and revered as of a scholar of repute.

In the latter part of the 7th cent. a testimony to the extension of Buddhist learning to Malaysia is given by a third Chinese traveller and monk, I-Tsing, who spent more than six years in Srināgoa, or Sumatra, engaged in the study of the law and the collection and translation of manuscripts, Sanskrit and Pāli. I-Tsing made his way to Sumatra and India by sea, sailing from a southern Chinese port in or about the year A.D. 671. His absence from home extended over a quarter of a century, during which time he is said to have travelled in more than thirty different countries, and to have brought or sent home to China four hundred Buddhist texts, of which after his return he himself, with the help of native Indian scholars who accompanied him to China, published translations of more than two hundred. I-Tsing greatly assisted in the manner of life in the monasteries and the discipline of the discussion of the theological and philosophical questions of the time. With the gradual decay and disappearance of Buddhism from India, its influence on literary culture and the thought and life of the people also so soon disappeared. However, and in some centres, at least, it is probable that there were maintained to the end the tradition and practice of learning, and the devotion to study, which made the monasteries influential in forming different schools than either of his predecessors. His narrative conveys the sense of a great activity of discussion and thought, and a wide-spread interest in knowledge, both religious and secular.

Within the boundaries of India itself the travels of I-Tsing were not so extensive as those of either Fa-Hian or Hiuen Tsang. He spent, however, ten years at the university of Nalanda, which he describes as possessed of considerable wealth, and in the composition of commentaries received by the several hundred villages—an endowment for which the monasteries were indebted to the generosity of the rulers of many generations. The monastic regulations at Nalanda were more strict than in other monasteries that I-Tsing visited, and the time and habits of the monks were all subject to rule. The hours of worship and work were determined by an early bird. Within the monastery itself there were more than 3000 resident priests, and the building contained eight halls and three hundred apartments. Besides the ordinary religious services of the monastery, the time of the monks was occupied in reading and study, and in the composition of commentaries and expositions and commentaries on the sacred texts.

The course of instruction for boys began at the age of ten with the study of grammar, to which they were devoted for three years. This was followed by the reading of commentaries and works of a more advanced character on grammatical science, logic, and philosophy, which were all committed to memory. Thus far the course of study was alike for priests and laymen; and no one could claim to be well educated who had not made progress to at least this extent. The priests further studied works on the Vinaya, with the Sūtras and Sūtras. More than once I-Tsing compared the stages or attainments of the student with the several degrees of the Confucian scholar, and enforced the duty of unremitting study by the example of Confucius himself. The treaties of the Abhidharma were also made subjects of study; and public discussions were held, at which heretical opinions were considered and refuted.

It is evident that I-Tsing was imbued with a great respect for the learning, ability, and devotion of his teachers. Of one to whom he was indebted in his early years he writes that he was equally learned in both Confucianism and Buddhism, and was well versed in astronomy, geography, mathematics, and other sciences; and it is the mark of the greatest pains in giving instruction, whether his pupil were a child or a full-grown and capable man. A second teacher was never wearied of teaching from morning to night. The personal attention and counsel which I-Tsing himself received from these and other men elicited his warmest gratitude.

With the cessation of intercourse between India and China, or in the absence at least of written records of such intercourse, direct evidence of the prosecution of Buddhist learning and of the study of the sacred books in the monasteries and at the courts of Northern India ceases. It is, however, to believe, however, that the monasteries in any sense ceased to be centres of education and discipline, where facilities were to be found for literary study, and where the dharma and holy books were kept in the library. The theological and philosophical questions of the time. With the gradual decay and disappearance of Buddhism from India, its influence on literary culture and the thought and life of the people also so soon disappeared. However, and in some centres, at least, it is probable that there were maintained to the end the tradition and practice of learning, and the devotion to study, which made the monasteries influential in forming

---

1 Ancient Geography, 1870, p. 458; see IG1, s. n., 'Barāgōn.'
the character and giving direction to the thought of successive generations of students. It is true that lists of Buddhist teachers which are recorded many of the names cannot be identified, and the date or even the existence of the writers is problematical; but the lists are nevertheless proof of the respect in which learning was held, and of the prevalence of a manner of life which gave opportunity for the cultivation of knowledge and rewarded its possessors.

There is sufficient evidence also that in Ceylon and Burma, no less than in India and China, and probably in other Buddhist countries, the literary tradition was well maintained. In Ceylon, in particular, the life and labours of Buddhaghosa (5th cent.) would have been impossible except on the basis of a well-established and long-continued practice and tradition of learning, which held literary pursuits in esteem, tested literary worth, and gathered together and carefully preserved the materials for literary study. How far during these early centuries of intense and fruitful monastic life the education and culture of the monasteries influenced the common people, it is impossible to determine. Perhaps not to any very great extent. The usage of later times, however, would indicate that, in some Buddhist countries at least, education was not confined to those whose lives were spent, or intended to be spent, in the comparative seclusion and leisure of the monasteries; that these last were in a real sense schools of general learning; and that in some instances, and possibly universally, where Buddhist control was sufficiently strong to enforce the rule, the entire population received a measure of education at the hands of the monks, always been a custom or custom to pass a certain length of time within the walls of a monastery, and to submit to the discipline of a training in the elementary principles of knowledge. That the consequences of Buddhist zeal for knowledge, freedom of thought, and speculation were very great and beneficial, it is impossible to doubt. Alone of the great religions of the East, Buddhism stood for liberty of individual thought and action. To a high appreciation of knowledge for its own sake and to principles of generous tolerance the Buddhist faith owed in large part the influential position which it held so long among the nations of the East, and the attraction which it has never ceased to exercise, that is, to attract to the monasteries by the love and respect entertained for the teaching of the Buddha. The propagation of the principles of the Buddhism scriptures. The ordinary schools come under Government control, and receive a grant-in aid. In the latest year for which statistics are available, about 30,000 children were thus trained. In the present system of education, the subjects of instruction are necessarily those of the Government Code; but in addition a catechism of Buddhist doctrine is taught, and the life-history of Gautama Buddha himself is studied. In the monasteries the education is, as a rule, entirely religious, but includes a knowledge of the sacred languages, Pali and Sanskrit, and also classical Sinhalese (Elu); in some instances astrology is included in the curriculum, and the elements of a science of medicine. Attendance at the Sunday schools is entirely voluntary; and, in addition to Buddhist doctrine, ethical teaching of a more general character is given. Apart from Government aid the Buddhist schools are supported by the gifts and liberality of the Buddhists themselves. The Government of Ceylon has recently adopted a system of compulsory elementary education, but as yet (1911) it has hardly had time to become completely effective. Probably it is correct to state that about 60 per cent. of the children of school-going age are in actual attendance at school.

1 Grateful acknowledgment is here made of information and help received from many correspondents in the different lands where Buddhaghosa and other great authors and teachers which are recorded many of the names cannot be identified, and the date or even the existence of the writers is problematical; but the lists are nevertheless proof of the respect in which learning was held, and of the prevalence of a manner of life which gave opportunity for the cultivation of knowledge and rewarded its possessors. There is sufficient evidence also that in Ceylon and Burma, no less than in India and China, and probably in other Buddhist countries, the literary tradition was well maintained. In Ceylon, in particular, the life and labours of Buddhaghosa (5th cent.) would have been impossible except on the basis of a well-established and long-continued practice and tradition of learning, which held literary pursuits in esteem, tested literary worth, and gathered together and carefully preserved the materials for literary study. How far during these early centuries of intense and fruitful monastic life the education and culture of the monasteries influenced the common people, it is impossible to determine. Perhaps not to any very great extent. The usage of later times, however, would indicate that, in some Buddhist countries at least, education was not confined to those whose lives were spent, or intended to be spent, in the comparative seclusion and leisure of the monasteries; that these last were in a real sense schools of general learning; and that in some instances, and possibly universally, where Buddhist control was sufficiently strong to enforce the rule, the entire population received a measure of education at the hands of the monks, always been a custom or custom to pass a certain length of time within the walls of a monastery, and to submit to the discipline of a training in the elementary principles of knowledge. That the consequences of Buddhist zeal for knowledge, freedom of thought, and speculation were very great and beneficial, it is impossible to doubt. Alone of the great religions of the East, Buddhism stood for liberty of individual thought and action. To a high appreciation of knowledge for its own sake and to principles of generous tolerance the Buddhist faith owed in large part the influential position which it held so long among the nations of the East, and the attraction which it has never ceased to exercise, that is, to attract to the monasteries by the love and respect entertained for the teaching of the Buddha. The propagation of the principles of the Buddhism scriptures. The ordinary schools come under Government control, and receive a grant-in-aid. In the latest year for which statistics are available, about 30,000 children were thus trained. In the present system of education, the subjects of instruction are necessarily those of the Government Code; but in addition a catechism of Buddhist doctrine is taught, and the life-history of Gautama Buddha himself is studied. In the monasteries the education is, as a rule, entirely religious, but includes a knowledge of the sacred languages, Pali and Sanskrit, and also classical Sinhalese (Elu); in some instances astrology is included in the curriculum, and the elements of a science of medicine. Attendance at the Sunday schools is entirely voluntary; and, in addition to Buddhist doctrine, ethical teaching of a more general character is given. Apart from Government aid the Buddhist schools are supported by the gifts and liberality of the Buddhists themselves. The Government of Ceylon has recently adopted a system of compulsory elementary education, but as yet (1911) it has hardly had time to become completely effective. Probably it is correct to state that about 60 per cent. of the children of school-going age are in actual attendance at school.
EDUCATION (Buddhist)

has proved less difficult in general to carry out the
order in the country districts than in the
towns; and greater progress in this direction has
been made in the Southern Province than in the
Northern. The system tends, and will increasingly
tend, to eliminate private schools, whether
belonging to the Buddhist or to any other com-
munity.

The general estimate of the moral influence of
the education given does not seem to be high,
even when office is taken of the present
deficiency is ascribed to the character of the teachers
employed, in many of whom a lack of moral fibre
and strength communicates itself with injurious
effect to their scholars. With the monastic schools
under present circumstances it would be impossible
to interfere; but elsewhere it would seem that it
ought not to be difficult to apply a remedy. The
pride and power of Buddhism have been in her
ethical system. And a practical failure in this
direction would be a confession of failure in the
whole.

The education of the girls, as in Eastern coun-
tries generally, is a far less important matter, as compared
with that of the boys. In the monasteries, of
course, only boys and young men are received and
taught. To the other schools and to the Sunday
schools both boys and girls are admitted, but the
latter are often on a different level from any monks
in the monasteries, but with the exception of a recent establishment near the centre
of the island, in which an education and training
is given to Burmese girls, parallel and
served as a school for girls, at an early age,
and remained

180 EDUCATION

years resident in the monastries. If
it was intended that he should return to the life of
a layman, he left school at the age of twelve or
early, having, in addition to religious instruction,
been taught reading and writing and the elemen-
tary rules of arithmetic. The boys who were
designed for a monastic life remained permanently in
the monastery, and received further instruc-
tion in the Vinaya and Abhidharma, and later
also in the Suttas. In the ordinary curriculum the
religious teaching was confined to the life and
sayings of Gautama and the stories of his previous
castings (Cetas, 'Jataka'); the points it was com-
mitted to memory, and also a few simple prayers
and hymns of praise in Pali.

The establishment of Government and mission
schools has had the effect of widening the boys
to a great extent from the monastries
schools, and has received their entire education
in other institutions, it is generally true that
through life their knowledge of, and attachment
to, Burmese rule and doctrine are of a much less
marked character than is the case with most of their fellow-countrymen. In some instances also
the kyauk serves the purpose of a preparatory
discipline, and after three or four years at the
monastery the boys are sent to receive their
education at a school under Government or mission
control. It is still true, however, that the great
majority of the people owe their training and
knowledge to the monasteries. The last Census
Report states that the percentage of the whole male
population of the country is literate, and this
result must be ascribed almost entirely to the mon-
astic teaching. Within recent years attempts
have been made from without to raise the standard
of the monastic schools, and those that have been
will be of great benefit to Government in
spection and accept the Government conditions
and code have been placed on the list for a grant-
in-aid. These overtures, however, have been re-
ceived with a measure of reluctance and suspicion;
and no great progress has been made. As in
Ceylon, and under the influence of similar motives,
government, has been given to the Church; it was
founded on native initiative, where instruction in
Buddhist doctrine and practice takes the place of
the Christian teaching in the schools established
by missionary agencies.

That the greatest influence upon the Burmese nation
of the monastic instruction in the past has been
beneficial there can be little doubt. The results
of the system were twofold. Although the
training was very elementary, and, as regards the lay
portion of the population, ceased at an early age,
it nevertheless imparted a character and tone of
literacy, and placed the whole people on a higher
level of interest and knowledge. No Burman need
be, or as a rule is, so illiterate, as he was
able to read and write. And thereby, both by the
mental discipline and by the stimulus to symp-
athy and thought, his outlook was widened and
opportunities were afforded of further development
of mind and character. The cumulative effect of a
universal training in the elements of knowledge,
perpetuated and enforced by custom and religious
habit through many generations, although it
might not carry his individual very far, could not
but exercise a broadening and elevating influence
upon the nation as a whole. The Burman stands,
and has stood, on a high level as compared with many
civilised nations, in respect of the mental progress
of the same origin and kin. And it is reasonable to
place a part at least of his progress and superiority
in the credit of his schools.

The second result has been on the side of ethics
and religion. The teaching of the monastic schools has tended powerfully to the support of the national
Buddhist faith. Every Burmese monk was instructed
in the history and doctrines of Buddhism, and left
school with a more or less intelligent knowledge of
the principles of his religion, and a reverence for
its ideals. The 'three jewels'—the Buddha, the
Law, and the Community (Buddha, Dharma,
Sangha)—represents a reality to him; his
sympathies and interest were enlisted at the most
impressive age in favour of the interpretation
of life and duty which Buddhism offered. The hold
of the Buddhist religion upon the heart and thought
of the people is greater than in many countries
domestic, and the faith itself preserved in compara-
tive purity. Morally the teaching has not perhaps
exercised the restraining influence that might have
been expected. At the present day the evil ex-
ample and the low standard of living of many of
the monks counteract the good effects which might
have been anticipated from the lofty theory and
precepts of ethics which Buddhism inculcates. It
is probable that in early times the moral power of

the religious teaching of the schools was greater, but was essential and indispensable to the discontent lives of the monks themselves. It has, moreover, been preservative of much that is good in the national life, and through all has declared a standard of correct living, and has promised and maintained a national consciousness of right and wrong.

Until the establishment of British rule no systematic instruction was provided for Burmese girls, and the boys were trained in Chinese and Buddhist schools. Nunneries, however, existed, and an order of nuns, methilah, but they were comparatively few in number and of little knowledge or influence. Part of their duty was to visit the women in their homes and give religious teaching. In a few instances also schools on a small scale were established in connexion with the nunneries, where an elementary education was offered on similar lines to that of the monasteries. There was no regular system, however, and it appears to have depended on the inclination or caprice of the nuns themselves whether any teaching work was undertaken. Little was done to influence the present time. Since the introduction of British Government, lay schools for girls as well as for boys have been established in considerable numbers under native direction. Buddhist schools are found frequently in competition with the Government or mission schools. The work done in them is of a similar character, and the curriculum is the same as in the schools for boys. The standard also of effectiveness is being raised under the stimulus of competition and the influence of example, and in larger numbers the teachers employed are of certified rank.

3. In Annam and Cochin China native schools are found widely distributed in some instances, but apparently they have had no direct relation to Buddhism. In Sikkim also and the Buddhist States on the north and north-east border of India the monks occasionally undertake the duty of giving instruction, or gather around them a few pupils as opportunity offers. There exists, however, no system or rule, and the occasional practice can hardly be regarded as having exercised any appreciable influence on the character or capacity of the people.

4. China.—The Buddhist zeal for learning, which was dominant in China in the early centuries, appears to have declined in the present time. The monks themselves are almost without exception uneducated and ignorant men, who are not held in any respect by the people, and are incapable of giving instruction in any real sense of the term, even if they possessed the will. There are, therefore, no native Buddhist schools in which a directed and definite attempt might be made to inculcate the principles of religion or to spread knowledge. The education of the country is entirely Confucian and based upon Confucian ideals (see EDUCATION [Chinese]), with which the Buddhist monks have no concern; and the children trained in the native schools learn to regard the monks with indifference and even contempt. Within recent years large numbers of the monasteries have been reclaimed by the Chinese Government, to be used as secular schools on modern lines, and the monks have been ejected.

Within the monasteries also the training given to the novices has been of the searest description, and has to meet elementary necessities. For the most part the pupils who entered the monasteries with a view to the monastic life were drawn from the lowest classes of the population. They were, therefore, as a rule possessed of little aptitude or desire for learning. The usual vows are imposed, and the pupils are then taught by the abbot or senior monk sufficient to enable them to take their part in the general services and ritual of the monastery and in the recitation of masses. Beyond this the training seems never to go. The result has been, and is, that among a nation by whom learning is held in high honour the Buddhist monks as a class are despised, and they exercise no influence for good. Buddhist monasteries also exist; but the monks no more command the respect of the people in general than do the monks. For a few are received in the temples, but they undergo the usual ceremonies of initiation, with shaving of the head; but no schools for girls are found in connexion with them, nor are any of the nuns definitely engaged in teaching.

The revival of interest in Chinese Buddhist literature on the part of some native scholars is due almost entirely, as in Ceylon, to example and incentive from the West. The literature is very extensive, and consists of translations of sacred books made from the Sanskrit or Pali, of many of which the originals are no longer extant. It is, therefore, of the greatest value from the point of view of Buddhist study to be preserved. The subject has entirely neglected by the Chinese people themselves in favour of the Confucian Classics, and has exercised no educative influence upon the nation at large, affecting either the religious or the ethical progress of any kind. Buddhism in China, in contrast to its attitude and standing in some other countries, seems to have been overcome by mental and spiritual inertness and lethargy, and to have lost all sense of it as a religion, or influence in the intellectual life and history of the nation.

It is not without interest, also, to note that the defective condition of Buddhism in China has aroused the sympathy of some of the more active and spiritually minded Buddhist churches of Japan. Proposals have been made to send Buddhist missionaries from Japan to open Buddhist mission schools in China, where a free training should be given to the children of the poor, with the object not only of extending a true knowledge of Buddhist principles and teaching, but of promoting civilization and education in general. It is very probable that thus, and in other ways, the newly awakened readiness in China to admit Western learning and instruction from without will show itself in a revived interest in and appreciation of a faith to which the people and land have owed much in the past, and the previous neglect be followed by a period of awakening and activity.

5. Japan.—In the larger sense of the term, Japan owes more educationally to Buddhist influence and instruction than perhaps any other nation, with the possible exception of the Burmese; and the Japanese have shown greater power of assimilation of teaching and example, both intellectual and moral. H. H. Chamberlain, whose knowledge of 'Things Japanese' was unrivalled, writes:

All education was for centuries in Buddhist hands; Buddhism introduced, introduced methods, moulded the folklore of the country, created its dramatic poetry, deeply influenced politics and every sphere of social and intellectual activity. In a word, Buddhism was the teacher under whose instruction the nation grew up.1

The same writer adds that Japanese scholars are usually forgetful of the fact of the paramount influence of Buddhism during the early and formative centuries of the national life. That influence had been deep and strong and lasting. And, although Buddhism was a religion disbelieved and disowned in Japan forty years ago in favour of Shintoism, its moral teaching and ideals, which are those of the Mahayana school, remain effective, and are probably increasing their strength.

---

hold upon a large proportion of the more thoughtful minds of the nation. As a formal religion, Buddhism is now to a considerable extent ignored in Japan, and is not likely to re-assert an extended sway over the young in the future. As intimated above, however, of her more or less continuous ascendency, the Buddhist missionaries were the instructors of the nation in every department of learning, and their influence was profound; and they have left a deep and permanent mark upon us in every department of the national life. In no country, not even in Ceylon or Burma, has Buddhism had a greater opportunity, or made a more effective and, on the whole, beneficent use of the opportunity put into her hands.

The details of the educational history it is impossible to trace in the absence of direct evidence or of documentary records. Buddhism was introduced into Japan from Korea in the middle of the 6th cent.; and it is probable, therefore, that Korean monks took a large part in the preaching and dissemination of Buddhist principles. Korean civilization was ascendant, of Chinese original, and was wholly, or almost wholly, exotic. Although it entered Japan by way of Korea, it was essentially Chinese in method and character, and Chinese monks took the teaching imparted by them to both the Buddhist religion and to a knowledge of the arts and sciences which it had made its own in the land from which it was derived. What might have been the effect of the introduction of Chinese civilization apart from the mingled and gentle influence of Buddhist teaching it is impossible to determine. The two were intimately conjoined. And the latter was the agent or medium through which the former reached the hearts of the people, and moulded their habits and lives.

Before the opening of Japan there existed schools taught by the monks, known as tero-korye, 'temple-luans.' They were not universal, or in connexion with every monastery; but that they were to be found in effective working in most parts of the country is proved by the fact that nearly all the male population were able to read. Attendance at these schools was usually compulsory, and it is probable that the education given did not, in the country districts at least, go much beyond the elements of reading and writing. The Buddhist schools for women, on the other hand, were, it may be assumed, always under the direction of nuns. As a result of these schools a large proportion of the women under the old régime in Japan were literate in the sense of being able to read. In more recent times the system of national education, with compulsory attendance in the primary grade schools from the age of six to the age of twelve years, has for the most part superseded these schools, which find it difficult to maintain themselves in competition with the Government institutions. A few remain, chiefly for the benefit of the poorer classes; and some Buddhist schools of a higher grade have been established, supported by private interest and contributions. In these lay teachers are employed as well as monks. The total number, however, is small, and the influence upon the general education of the country is very restricted; for the Government system is so complete in its provision for education, from the lowest grade to the highest University and post-graduate requirements, that there is little room or opportunity for private enterprise. The curriculum of the schools in secular subjects conforms to that of the Government regulations. In addition, Buddhist doctrine is taught—probably in no instance to any great extent—and the principles of Buddhist morality are inculcated. There are also a few girls' schools of this class, but they have little or nothing to do with the nunneries, and the nuns do not teach in them.

In all the monasteries, provision is made for the training of the younger monks in Buddhist doctrine and practice. The sacred books are studied and expounded, and the principles of the faith explained and enforced. Many of the monks are men of considerable learning as well as of piety. An increasing interest in the traditions and tenets of the various sects; and in no direction has the tendency to a religious revival shown itself more clearly than in the emphasis laid upon the devotional and spiritual element in the teaching of the Buddhist books. In the country districts there has been little movement or awakening of interest. In the larger towns, however, partly no doubt with the polemical aim of counterworking Chinese teaching and the influence of Christian missionary schools, a considerable increase of zeal and activity has been manifest, which endeavours by direct instruction, as well as by the Press, to confirm the principles of the faith in monks and the people. And the monasteries have become, at least in some instances, centres of religious thought and of a real literary culture, which cannot fail to be of influence on the nation.

Buddhist Kindergartens schools also exist, but in no great numbers. The suggestion of these has been adopted from the Christian missionary institutions, and both in form and methods the model of the latter has been followed. Within the limits of age and training there is naturally hardly any opportunity for distinctively Buddhist teaching, although the schools are under Buddhist control. In some instances Christian instructors have been employed, in view of their superior technical capacity and knowledge.

6. Korea, etc.—In countries where Buddhism has been a secondary influence, at least in recent times, as in Tibet, Korea, Manchuria, and Mongolia, it is not easy to determine how much of educational practice and the teaching of the young, where this has been carried out at all, has been due to Buddhist example and effort. Training in doctrine and ritual is always given in the monasteries to the younger monks and novices, and usually includes a knowledge of at least the elements of reading and writing. It is hardly probable that in any of these branches was divided below the most elementary stage. During the most flourishing period of Buddhism in Korea, from the beginning of the 10th to the end of the 14th cent. of our era, all learning was concentrated in the hands of the monks, and politically, as well as ecclesiastically, their influence was dominant. They cultivated the sciences and shared in the government of the country, using the power and prestige of knowledge to secure temporal advancement. There was no attempt, however, to extend the advantages of learning to the laity, or any evidence that the schools of the monasteries were open to others than the monks and novices. In Siam also learning was cultivated, and in recent years has revived under royal patronage. It was confined, however, to a minority; and its influence upon the nation as a whole was small, although it is still held, as in Burma, to the preservation of Buddhism as the national religion and a permanent force in the national life. Astrology and magic also in some instances, especially in Tibet, have entered into the curriculum. But the introduction of these has been due not to Buddhism but to the primitive Nature or other worship upon which Buddhist forms and doctrine were imposed.

Under ordinary circumstances there did not exist in any of these countries a system of educa-
tion for the Buddhist laity. Individual monks might, and probably did, gather around them a few pupils, to whom of their own free will they imparted elementary instruction, teaching them out of the limited store of their own knowledge. The practice, however, was infrequent, and seems to have entirely died out. The almost universal condition of comparative ignorance and neglect is, indeed, in striking and not pleasant contrast to the habits and life of the early centuries, when, in Central Asia at least, the Chinese travellers make reference to a stirring intellectual life in the large cities, and monastic establishments on a considerable scale with eager students of the Buddhist writings.

It is evident that the influence of Buddhism was at that time much greater than at the present day, and was exerted in the direction of literary culture and pursuits. Recent discoveries by M. Aurel Stein and others have tended to corrobortate the Chinese accounts of the flourishing condition of the Buddhist faith.

The conclusion to be drawn from a survey of the whole is that, with the exception perhaps of Burma, the early efforts of Buddhism for the promotion of educational training and advancement have not been maintained. Japan ranks next to Burma in regard to the degree in which Buddhist discipline and training have exerted a real influence upon the general population; and it is far in advance of Burma in the richness and variety of its intellectual interest. Ceylon is overshadowed by the religious antagonistic influence of the religions of India; but partly for that reason, partly in opposition to the religion of the West, Buddhism is there making a great effort to free itself from foreign admixtures, to estabish the purity of its own teaching, and to keep and strengthen its hold upon the thought and training of the young. It is, indeed, too early as yet to determine, or even to forecast, what the effect will be of the religious reactions within Buddhism. It is not a little remarkable that after a long period of stagnation and decay there is an almost universal awakening on the part of Buddhists themselves to an interest in their own history and doctrines, and a zeal for the maintenance of the faith, and even for its extension amongst foreign peoples. Nor is the movement by any means confined in the East to Buddhism alone. The efforts of the latter, however, are naturally more striking, because of the literary culture and the education of the mind and thought. Such an appeal, made on behalf of an ancient faith with a widely renowned and honourable past, cannot fail to establish sympathy and respect, even among those who believe that the practice and discipline of the faith are inconsistent with the best interests of mankind, and its teaching out of harmony with the highest truth.

LITERATURE.—There is not much literature that can be cited upon the subject of education in Buddhism, and there is no work that attempts to give a connected view of the whole. The narratives of the Chinese monks have all been translated into English as follows: Fa-Hien, Record of Buddhist Kingdoms, tr. J. Legge, Oxford, 1838; Hien Tsang, Journeys to India and Tibet, 2 vols., London, 1904-05; T. Watkin, A Record of the Buddhist Religion, tr. A. Tukakuto, Oxford, 1899. Works on Buddhism in its various aspects, a few may contain more or less detailed reference to the training of the monks, e.g., R. C. Colebunston, Buddhist Ethics, London, 1879; H. F. C. von Bissing, Manual of Indian Buddhism, Strasbourg, 1883; C. A. Schleich, Chinas, China, 2 vols., Oxford, 1879; P. H. Kirman, Manual of Indian Buddhism, Strasbourg, 1869; H. F. C. von Bissing, Manual of Indian Buddhism, London, 1910; S. W. K. White, Buddhism, London, 1909; G. C. C. White, Buddhism, Story of Korea, London, 1911; M. Aurel Stein, Ancient Khedive, Oxford, 1907; and Ruth of Desert City, London, 1912. The records of Buddhist education in India are most fully expanded by Baron Kuscheik, Japanese Education, London, 1890, and by an earlier practitioner, P. S. Cha, x., xil., etc. The Governments of Ceylon, Burma, and Japan issue annual reports on education, which are the authoritative statements in the several countries. See also the art. on BURMA, BURMA ECONOMY, CHINA (Buddhism in), etc.

A. S. GEDEN.

EDUCATION (Chinese).—As no nation can vie with China in the alleged antiquity of her literary origins, so perhaps no nation surpasses her in the importance attached throughout her history to education.

'real,' in Chinese. 'letters were valued solely as an aid to politics, and scholarship as a proof of qualification for civil employment'; and, if in later times 'letters began to assume the position of a final cause,' still civil employment was still maintained, and these four classes into which Chinese society is divided—scholars, agriculturists, artisans, and traders—scholars take precedence. But for the word translated 'scholar' the distinction gives this: 'officer, soldier, minister, learned man, scholar, gentleman'; and 'gentleman' perhaps best covers all that a Chinese scholar should be. The ideal scholar is thus described: 'Early and late he [the scholar] studies with energy, waiting to be questioned. . . . The scholar's garments and cap are all fit for dressing and he is careful in his walks and in his actions; . . . he seems to have a difficulty in advancing, but retires with ease and readiness; and he has a shrinking appearance, as if wanting in power.' His guards are his studies, that he may be in waiting for whatever he may be called to; he attends well to his person, that he may be ready for action. 'With the scholar friendly relations may be cultivated, but no attempt must be made to constrain him; . . . he may be killed, but he cannot be disregarded . . . he may be gently admonished of his errors and failings, but he should not have them enumerated to him to his face.' The scholar considers himself the model of science and good faith to be his coat-of-mail and helmet; propriety and righteousness to be his shield and buckler; he walks along, bearing a scroll over his head benevolently opened, holding righteousness in his arms before him; the government may be violently oppressed, the people oppressed; the doctor may fail, but there is the way in which he maintains himself. . . . if the ruler responds to him, he does not dare to have any hesitation (in accepting office); if he do not respond, he does not have recourse to flattery. . . . The scholar lives and has his associations with men of distinction, with the intellect, the arts are the subjects of his study. . . . The scholar learns extensively, but never allows his researches to come to an end; he does what he does with all his might, but he is never weary . . . The scholar, when he hears what is good, tells it to his (friends); and, when he sees what is good, shows it to them. . . . Gentleness and goodness, respect and attention, generosity and large-mindedness, humility and courtesy, the rules of ceremony, singing, and music, these are the qualifications and manifestations of humanity. The scholar possesses all these qualities in unison and has them, and still he will not venture to claim a perfect humanity on account of them—such is the honour (he feels he has earned); and the human being (he declines it for himself). The scholar is not cast down, or cut from his root, by poverty and mean condition; he is not elated or exhausted by the divorce of the world and himself. He is styled a scholar' (Li Chi, xxvi. 5-39 (SBE xxvii. 400-401). Such a sketch shows us the ether of Chinese education, and is the most prevailing as pertaining to come from Confucius himself.

In very ancient times there was an official whose title has been translated 'Minister of Instruction.' His functions were described by C. Boas as 'to teach the multitudes all moral and social duties how to discharge their obligations to men living and dead, and to spiritual beings' (SBE xxvii. 231 n.), it is not easy, however, to discover through what various official functions. The most vivid glimpse we get of
ancient education is in the Analects, which records the intercourse between Confucius and his disciples. In his 22nd year Confucius came forward as a public teacher. He taught all who, attracted by his reputation, were willing and able to receive his instructions, however small the fee they could afford. His school was peripatetic, and the teaching conversational. Its note is struck in the opening sentences of the Analects: 'The Master said, Is it not agreeable to hear the constancy of perseverance and application? Is it not delightful to have friends (fellow-students) coming from distant quarters?' His themes were the Book of Poetry, the Book of History, and the maintenance of the Rules of Propriety. He taught ethics, devotion of soul, and truthfulness. He attached great importance to the ancient poetry as an instrument for stimulating the mind and assisting in self-contemplation, and to music, which, in his opinion, as in that of Plato, could, according to its kind, either deprave or correct the mind (cf. Shun Tien, ch. v.).

Such instruction as that given by Confucius to his disciples may be compared with tutorial instruction of University students, and implies some preliminary opportunities of learning. We find survivals from ancient times the names of schools of various grades, and the definite teaching given, the names of their organization and scope. Perhaps they were only for the children of men of rank, though they may have been imitated by the non-official classes. Probably in those early times education was left largely to private enterprise, as it has been in later periods. The Sacred Edict expressly commends the founding of a family school. A wealthy man may invite a teacher and start a school for his children and his friends, perhaps even for all the children of his clan or village; or a whole village may unite and open a school, the expenses of which are met by fees or by a contribution from the public funds of the village. In the larger towns colleges may be started pretty much in the same way. Such schools, not otherwise graded than by the ability of their teachers, have been the nursery of all China's scholars. Home education, in the narrower sense of the importing of book lore by parents to their children, has never counted for much in China. The mothers of China are for the most part too ignorant to give instruction. Even when the parents do not hold good for the fathers, still, opinion is rather against a parent acting also as teacher (Mencius, bk. iv. pt. 1. ch. 18). Home influence, however, is felt indirectly. It is well to tell a child that he has 'no home training' is reckoned a severe rebuke by reason of its oblique reflexion on his parents. One of the Odes contains the lament of a father over his indolent son; in another it is said, 'Our mother is wise and good; but among us there is none good.'

A well-known anecdote of Mencius' mother both exhibits her solicitude to exact a right influence on her son's character, and dates the beginning of that influence in his pre-school days. One day Mencius asked his mother what the butcher was killing pigs for, and was told that it was to feed him. Her conscience immediately reproved her for the answer. She said to herself, 'While I was carrying my boy in my womb, I would not allow the butcher to kill the pigs, and I ate no meat which was not cut properly—so I taught him when he was yet unborn. And now to teach him to lie by deceiving him—this is to teach him untruthfulness.' Accordingly she went to the butcher's and bought a piece of pork for Mencius.

The education of a Chinese youth was thus left to the schools and the parents. The official education, of course, might be accessible to him. But, though there have been no Government schools, it would ill become one who writes from the Chao-Chow Prefecture to remember the debt it owes to Han Wén-kung (A.D. 765-824). How powerfully education in any district may be fostered by an intelligent and energetic official. Moreover, it must not be supposed that the influence of the Chinese Government has not been effective, in favour of education. That influence has been brought to bear on the minds of all the sons of the great system of competitive examinations. The germ of the system may be found in the post-official examinations already in existence in the time of Shun (2255 B.C.), who every three years examined into these children who had been brought under him, degrading the undeserving and promoting the deserving (Shun Tien, ch. v.). But in its development this post-official examination system has been overshadowed by the post-official. The system may be said to have reached its full development in the Ming period, and was until recently continued under the Manchu rule. The whole Empire was knit together in a great network of examinations for an ascending scale of degrees, kua-t'ai, chu-jen, chin-shih, held periodically in each county, prefecture, and province, and culminating in an examination for admission to the Imperial Academy (Hanlin, or Hanlin Academy). Mencius (Hanlin, ch. v.), however, does not appear to have been interested in the examinations. He asks, in the text of performance, got his name on the register of scholars, he was bound to present himself periodically at the examinations for the degrees he held, even though he did not aspire to a higher.

The primary object of this system of examinations was to obtain able men for State service. While securing this, it gave a great stimulus to education, but at the same time it reduced it, at least, to a narrow uniformity. In more ancient times, candidates were examined in the rules of propriety, music, archery, horsemanship, writing, and arithmetic, to which were afterwards added such subjects as law and military science. But latterly, however, the ancient names have been retained, what has been sought is neither varied accomplishment nor a mass of acquired knowledge, but rather an intimate acquaintance with the classical books and an exquisite facility in Wen-li (the literary language) both in prose and verse, together with skill in penmanship.

A boy who begins to attend school—usually at the age of 7 or 8—on the reason days of each of his life, marked by the bestowal on him of a new name chosen by his teacher. He starts at once, with loud-voiced repetition, to memorize the books which are the scholar's ornament, beginning with the Thousand Character Primer or the Three Character Classic, and passing on to the more strictly classical books. Not till the memory has been well drilled is a beginning made in explaining the meaning of the books memorized, the explanation being a midrash founded, in the case of the classical books, on the commentaries of Chu Hsi (A.D. 1130-1200). The necessity of such explanation is obvious if it is borne in mind that Wen-li, in which the books studied are composed, never has been a vernacular medium anywhere in China at any time of her history. Passages with his reading, the pupil is taught penmanship and composition in all these. This pupil, as he proceeds, especially with a view to excelling in the famous 'Eight-legged Essay.' The result of years of such training is the production of a ripe Chinese scholar, in knowledge a child, intellectually a force a giant, his memory prodigious, his apprehension quick, and his taste in literary matters exquisite (Martin, Hanlin Papers, 1st ser., p. 38). The fact already mentioned, that Wen-li is not the mother-tongue

1 A somewhat parallel of 'vatures for degrees in university subjects needs only to be mentioned.'
of any Chinaman, helps to explain why, in spite of all the importance attached to education, the percentage of illiteracy in China is so high. Martin estimated that the proportion of those who can read understandably is not more than 1 in 20 for the male sex, and 1 in 10,000 for the female. Not even the better schools are all with Chin and Confucian education, as the great majority are, and of these many are engaged in the 'Family Instructions' of Chu Tsu, are accepted as standard works. One would like to include that solitary example of Chinese preaching, the official expositions of the Sacred Edict on the 1st and 15th of each month; but the exposition is too full of formalism, and its influence nil. Of the Sacred Edict itself it is said (Martin, Hanlin Papers, 2nd ser., p. 325) that 'nothing, since the discourses of Mencius, gives a greater show of what is required, but the kind of morals inculcated by the head of the nation.' Of inalienable, but doubtless great, effect in moulding character are the numerous proverbs, with their pithy statements of morality and prudence.

The present condition of education in China is very different from that outlined above. Under the new régime, which may be conveniently dated from 1902 (establishment of Ministry of Education; note also decree of Oct. 1905 abolishing the old system of examination for degrees), the Government has issued an educational programme, with schools of all grades up to a University. The published code is interesting as showing what is aimed at, but has less in it that is peculiarly Chinese, being based on Western systems. One notes with satisfaction the wider range of studies, the place given to ethics and to physical drill, and the recognition of female instruction. Western textbooks also indicate an advance in educational methods. The working of the scheme varies according to the interest of the officials in each locality. There is an inevitable shortage in the supply of competent teachers, so that we find schools well equipped with apparatus which no one can use; and further obstacles easily arise from the fact that each locality has to bear the financial burden of its schools. If the difficulties at present, still, with all drawbacks, the situation is full of promise; and one may hope that, when things have settled down under the republican regime, more rapid advance will be made in organizing a system of national education.

In view of the importance in education of the religious element, which is ill provided for by the teaching of ethics supplemented by a perfunctory worship of Confucius, much may depend on the attitude that the educational authorities take up towards Christian pupils and teachers, and towards schools under Mission auspices which have a share in the burden of furnishing the schools. Existing Mission schools of all grades (if they are educationally efficient) and the projected Christian University may be most useful, directly and indirectly, even though they fail to secure recognition as part of the Government educational system.

And, indeed, in complaining of the non-recognition of educational institutions under foreign control, and teaching a religion the foreign associations of which are still prominent, it is easy to become unreasonably forgetful of the point of view naturally taken by the rulers of an ancient and proud people inspired by a lately awakened patriotism.

EDUCATION (Greek).—Introductory.—What form education took in the first period of Greek history, we have already told with hot tears and of sand and silk and veins. The Chinese have ever been imitators of the ancients, and female literary education has therefore been neglected, though, of course, literary labours are by no means unknown. Of more internal educational influences may be mentioned the constant issue of old and new tracts, hortatory and moral, in the case of which such as the 'Family Instructions' of Chu Tsu, are accepted as standard works. One would like to include that solitary example of Chinese preaching, the official expositions of the Sacred Edict on the 1st and 15th of each month; but the exposition is too full of formalism, and its influence nil. Of the Sacred Edict itself it is said (Martin, Hanlin Papers, 2nd ser., p. 325) that 'nothing, since the discourses of Mencius, gives a greater show of what is required, but the kind of morals inculcated by the head of the nation.' Of inalienable, but doubtless great, effect in moulding character are the numerous proverbs, with their pithy statements of morality and prudence.

EDUCATION (Greek).—Introductory.—What form education took in the first period of Greek history, we have already told with hot tears and of sand and silk and veins. The Chinese have ever been imitators of the ancients, and female literary education has therefore been neglected, though, of course, literary labours are by no means unknown. Of more internal educational influences may be
EDUCATION (Greek)

about 322, the year of Aristotle’s death. With him ancient Greek thought and ideals ended; though the spirit of the Athenian system of education did not die, but was destined to spread and to exercise a powerful influence in Rome and in the elder Mediterranean region.

1. Homicric times.—Attempts have been made to picture Greek education during the period when the Homeric poems arose (650-750 B.C.). The evidence in Homeric bards, however, and any inferences must be very uncertain. The speeches of Achilles, Nestor, Odysseus, and other heroes, with their perspicuous argument, their repartee, irony, and pathos, imply that, while the Iliad was taking shape, orators existed who could speak, and audiences existed who could appreciate the spoken word. Phoönix claims (II. ix. 443) to have taught Achilles to be a speaker of words and a doer of deeds: μὲνιὶ ρ. τριγμάτων προκείμενος τε ἐπίγραμμα. In those days, however, mental culture came mostly from singing and lyre-playing. Bodily training consisted of dancing, wrestling, swimming, running, and such like; and these would be accepted a captain (άρχοντας), who had won his comrades. By precept and example, the father would instil religion and morality into his boys; while the girls would learn household duties and the rules of an upper-class Spartan life.

2. Dorian.—(a) Cretan.—“In the normal Greek conception,” says Jebb (Attic Orators, 1893, ii. 14), “Society and the State were one. The man had no existence apart from the citizen.” And, as an indigenous type of education inevitably harmonizes with the national ideal, Greek education is closely related to the Greek idea of citizenship. Hence, to take one aspect, we find education restricted to the male citizen, and to the superintendence and training of the boy. Among the Dorians, whether in Crete or in Lacedaemon, all whose birth entitled them to citizenship were bound to undergo the complete course of training. In Crete the males of a certain number of families shared the common meals (άρχοντας μαθητάς) in a common dining-hall (Aristotle, Pol. ii. 10. 3). There the boys of those families lived, and received an education from observing the conduct and listening to the conversation of their elders, one of whom was the παθάδευς, or superintendent of the boys of that house (Athenaeus, 143 E). Scantily clad both summer and winter, they passed through a hard training of body, mind, and character. They were exercised in gymnastics, in handling the bow and other weapons, and in fighting—sometimes single combats, sometimes house with house. They learned also to read; to sing hymns in honour of the gods, and songs to the fame of the brave; and to chant the laws, which were set to music (Strabo, x. 480, 482, 483; Ælian, Var. Hist. ii. 39). At the age of seventeen, having sworn to serve the State loyally and to hate its enemies, they were freed from the supervision of their elders and gathered in ἀγώνες, or derveshes. They remained members of these till marriage. Each dervesh was under a master of games (παθάδής), who had the power to fine or punish. He led them to the gymnasion for practice, and to the open country on hunting expeditions. One dervesh fought minic battles with another. The sole aim of the Cretan training was military.

(b) Sparta.—The military ideal was still more prominent in Sparta, where the Doriens tenaciously clung to a traditional system which had arisen when Sparta was a comparatively small band of invaders in the Peloponnesse, keeping men of alien race in subjection by main force. In Sparta, the Doriens possessed of full citizenship were numerically over-numbered by the μείζονες, who were personally free but politically unfriended, and by the helots, who were serfs attached to the land; and it was, therefore, necessary that the citizens should be made, as far as training could make them, men of courage and endurance.

As soon as a child was born, it was inspected by the elders of the tribe. If weakly, it was exposed (cf. art. CHILDREN [Greek], in vol. iii. p. 540); if strong, it was handed to the mother to remain in her care till the age of seven. Spartan discipline began early. “…To be brave, and any hardship, was part of their education. In 483 the Persians invaded Greece, and the Greeks were taught to fight, to fast, to keep from screaming, and to overcome the fear of being alone in the dark. The boys were taken to the public dinners (φαντάζαντ), where they learned to be Spartans like their fathers.

When they reached the age of seven, the State intervened and carried them off to be educated in public boarding-houses. They were arranged in θέατα, droves, and θόα, troops, under the strict charge of a State official, the τραχίονιος. Sleeping on beds of straw or reeds, with no blankets, going about barefooted, clad in a single garment, and stinted in regard to food, they became imbued to hardihood. Food they were encouraged to steal; but, if caught in the act, they were punished, to make them cunning forgers in war. The boys in each house were under a βούταγος, who was one of the εφέστες, or men over twenty years of age. It was his duty to superintend the boys so as to stimulate them to smartness in foraging, and to train them in concise answering of problems on behaviour and conduct. Severe punishment was all-pervading. Floggers (παλαικτές) attended the τραχίονιος; any citizen might inflict a beating; the βούταγος punished disobedience. Flogging—competitions were held to decide who could stand the greatest number of strokes (Xenoph. Resp. Laced. ii.). The main object of education was gymnastics, which aimed solely at developing warlike qualities, such as bodily activity and powers of endurance. The boys learned to run, leap, play ball, swim, throw the javelin and the discus, ride, and hunt. They also practised dancing. Some of the dances were religious; but most were war-dances, i.e. rhythmical marchings and evolutions (Lucian, de Saltationibus, 10-12; Athenaeus, 630 E, 631 A). The gymnastic training was severe, but it was not brutalized (Aristotle, Pol. v. [viii.] 4; Xenoph. op. cit. v. 9). Yet the Spartans were not without humanizing influences, though these had not free play. Their music was of a stiff character; and the Dorian mode was regarded as inspiring the hearer with firm and deliberate resolution which kept the mean between pusillanimité and fool-hardiness (cf. Milton, Par. Lost, i. 550 ff.). They sang hymns in praise of the gods, and chanted the laws of Lycurgus. Their other poetry, designed mainly to stir up bravery and patriotism, consisted of songs eulogizing their heroic ancestors and jeering at their war. Reading, writing, and arithmetic were not in great repute, and seem to have been introduced comparatively late. Even in the 4th cent. B.C. many Spartan citizens were declared to be unable to read or write (Ibocm. Panath. 1234 D). But, apart from reading, the Spartans possessed literary equipment, acquired by memory; nor were they without a turn for pithy and terse speech—what Plato calls φυλλωτός (Phyllos, Lys. 155 E). In addition to their national songs and hymns, they knew and valued Homer (Plato, Laws, 680 C).

In their eighteenth year, the youths left the boys’ houses, and, for the next two years, were styled ηλικίας, or young citizens. They were still under strict discipline. They were trained in arms and in military evolutions; in organized battles, team against team; in hunting; in musical drill and choral dancing. They were also dispatched on secret service (σπείρες), when
they prowled about the country, scouting, and, if necessary, slaughtering helots. On this service they learned to rough it, and had opportunity to display courage and resources (Plato, Laws, 633 B, C).

In Sparta the girls had a training similar to that of the boys (Xenoph. op. cit. 4). They practised physical exercises—dancing, running, wrestling, leaping, throwing the javelin and the discus—to make them worthy mothers of a sturdy race. The young maidens joined in choral songs and dances. The other Greeks remarked that, in spite of this training, Spartan girls were not less modest or well behaved. In the capacity of sisters, wives, and mothers, their opinion was respected, their censure dreaded, their commendation sought.

This system of education, with the stern discipline that pervaded Spartan life as a whole, created a nation of soldiers—brave, self-sacrificing, reverencing old age, devoted to the State, ready with a jest and a smile to die for their country. But their morality was of the State, not in the individual. When the Spartan was free from public constraint, and then, especially abroad, he was apt to degenerate. The system failed to develop the intellect and the imagination, and personal power of initiative (see, for various points, Plato, Laws, 14-16, xiv-xvii).

3. Athenian.—(1) Aim and scope.—Athenian education can be treated in detail, for the sources of information are fuller. This is fortunate, for two reasons. First, the Athenian type was, with modifications, the general Hellenic type, except among the Dorians. Then, it is of greater intrinsic worth: it gave more play to the individual nature, and sought to effect a full and harmonious development of the whole man. Its limits, especially at first, was distinctly ethical. The different branches of education were designed not to produce scholars or musicians or athletes, but to develop and build up moral qualities. It is true that this goal was not always reached. Sometimes balance was upset by too much devotion to one or other of the branches, sometimes the end was lost sight of in the means. No better statement in brief of the Athenian system can be found than the passage from Plato's Protagoras (323 C—326 E). When the problem 'Can virtue be taught?' is started, Protagoras declares the teaching of virtue to be the main object of education. In his mind, the cradle to the grave, to be one round of instruction and admonition. Then follows the description of the Athenian training of the young.

'As soon as a boy understands what is said to him, his nurse, his mother, his pedagogus, and even his father, spare no pains for the sole purpose of making him as good as possible. At the very moment when he does any act or speaks any word, they point out to him that one thing is just, another is unjust; this is beautiful, that is ugly; this is holy, that is unholy; and they say "Do this," "Do that." If he obeys willingly, well and good: if not, they correct him with threats and with blows, like one straightening a piece of wood that is bent and warped. Then, when it is time for boys to go to school, their parents hand them over to the masters to pay for more attention to training in proper behaviour (εὐευθείαν) than to teaching letters and lyre-playing. The masters attend to this; and, when the boys have learnt their letters and are sure to understand what is written, just as formerly they understood what was said, the master places beside them on the benches the works of good poets for them to read—poems abounding in moral admonitions and in narrative, elegies and panegyrics of the brave men of old. These the boys are forced to learn by heart, that they may zealously imitate them, and be inspired and desire to be like them. The master, in turn, does exactly the same. He gives heed to instructing self-control (ευχεροποιίαν) and to see that the boys do not go astray, when they have learnt to play the lyre, he teaches them the works of other poets—lyric poets too, before the age of twenty, to accustom his young charges to music. He teaches them the rhythms and harmonies to dwell as familiar friends in the souls of the boys, that they may be more refined, and, becoming more enamoured with good rhythms and good harmonies, may be more effective for speech and for action. Further, the boys are sent to the palæstra that their bodies may be strengthened to do yeoman service to their efficient intellect, and that a bad condition of body may not force them to play the coward either in war or in any other of the endless activities. This is what is done by the parents who can best afford it, that is to say, by the wealthy, whose sons are the earliest to go to school and the latest to leave.'

With this cf. Aristophanes, Clouds, 961 ff., where the old system is eulogised as the nurse of the name of Marathon; and Lucian, Anacharsis ἐν τῇ Γαγάναιᾳ, 20 ff.

It should be noted that in Athens, as in Greece generally, the lowest as a priest had nothing to do with education, and that there was no direct religious teaching. What religious training there was came through learning hymns to the gods, through the ritual of worship at home and in the temples, and through the public festivals. In Athenian education it was the poet, not the priest, that exercised a paramount influence. This enables us to understand Plato's attack upon poets and dramatists for the pernicious effect of their works on young and growing minds (Republic, 377-379).

In Athens, as in Sparta, education was not for all; but, since Athenian citi- enry was a larger proportion of the male inhabitants were educated.

(2) Mothers, nurses, pedagogoi.—It was the father, and not the tribal elder, that in Athens decided whether or not the child should be reared. Till the age of seven, children were cared for by mothers and nurses, who imparted the rudiments of learning in the form of nursery rhymes, myths about the gods, and tales of heroes, beast fables, as well as stories of ghosts and goblins—μούροι, ἑρωνα, ἑράλδη, λέων (Xenoph. Helen. iv. 4, 17; Lucian, Philopo. 31. 2; Theocr. E. 40; Strabo i, 10. 1). The (37A) had much to say about the ethical danger lurking in the myths and stories. To interest the child at this stage as well as later, there were the usual toys, amusements, and games—rattles,1 dolls, dolls' houses, boats, tops, hoops, swings, hobby-horses, balls, leap-frog, ducks and drakes, blindman's buff (μύθος, χαλέα μύθος, beetle-flying (μυλόβουτος), balancing on an inflated wineskin well (πολεοσ), in the gymnasium, or elsewhere; to look after his manners; and to behave if necessary. At times, the slaves selected were those who, from age or physical disablement were unfit for other tasks; or they were boorish and spoke with a bad accent. Such disqualifications made them incompetent to manage the older lads. The supervision lasted till the boys reached the age of sixteen or even eighteen (Plato, Lysis, 205 C, Laws, 604 C; Plutarch, de Educ. Puer. vii.).

3) Schools, schoolmasters, State supervision.—The rise of schools followed the employment of writing for literary purposes. We hear of school buildings in the beginning of the 6th cent. (Herod. vi. 27; Plutarch, Themis, x.), and they existed a hundred years earlier, if we may trust the statements of Isocrates (c. Timarch. 9 ff.) and Diodorus (xii, 12). In Athens, schools were both more numerous and varied in kind, being sometimes very inferior (Demosth. de Coron. 257 ff.=312 ff.). Teaching might be conducted in the open air—in some convenient nook of temple or temple, in disused temple or temple, in disused temple or temple. The schools were school buildings were not grand structures or elaborately housed. The head master sat in a high-backed chair, the other masters and the boys on stools and benches. The walls hung with

1 The renovated stones were the model of a rattle, sérkex (Aristotle, Pol. v. viii.16 ad init.).
writing-tablets, rulers, cases for manuscripts, and lyres (see, for example, the vase-paintings). The room might at times be adorned with statues of gods, muses, and heroes, and with pictures illustrating scenes from Homer. The Tabula Iliaca, now in the rock-cut necropolis of Nemea, is regarded as part of a series of these illustrations. The school day began soon after sunrise,—not such a variable hour in Athens as in our northern latitudes. Music was continued briefly after sunset. How the day was portioned out among the various subjects is unknown. Nor can the number of holidays be precisely stated. Schools would not open on public festivals and other general holidays. We find fugitive records of prizes given after public competition, chiefly for athletics, but also for music and letters.

The teacher of letters (γραμματής) was not highly honored, and consequently the best type of man was not always obtainable. 'He is dead, or he is teaching letters,' was a byword of any one who had unaccountably vanished. The presence in schools of pet leopards and dogs belonging to pet owners was not on record. The Areopagus would exercise a general oversight,—a function which the officials called συμφωνητής seem to have performed in later times. Custom, however, if not law, made a certain amount of learning general in Athens. How much that would vary with the standing and the desire of the parent. Though the Spartan severity of flogging did not exist in Athens, punishment was common and severe in all departments of education. In the home, too, the rod was not spared. The general opinion agreed with Menander's saying, 'A man unwhipped is a man untrained' (Xenoph. Anab. ii. 12). Herodotus, Xenocrates, and Aristotle trained the years immediately preceding manhood at eighteen.

The Athenian boy learned, first of all, to read intelligently—a considerable mental discipline, since in Greek writing the words were continuous as well as without punctuation. Next, he was taught to read with proper articulation and accent, and to bring out the melody and rhythm of the sentence. The secrecy of books in early times necessitated much oral work. It was not till the age of Pericles (409-429) that books became common. Slave labor was tolerably cheap, and they speedily came into school use. In spite of Plato's outcry (Protag. 329 A, Phaedrus, 275 f.), against the written word as lifeless compared with the spoken word, books played an important part in later Greek education. A good memory, then, was very important, particularly in the earlier period; and a great amount of poetry was learned by heart. Besides strengthening the memory, this roused the imagination, cultivated literary taste, stored the mind with moral maxims and homely wisdom, and stirred the boy to emulate the brave deeds of his forefathers. Homer was supreme, revered as the educator of Greece, the matchless guide in all affairs of life (Xenoph. Sympos. iii. 5, iv. 6; Plato, Rep. 606 E). Other poets were Hesiod, Theognis, Pindar, Solon, Mimnermus, and Tyrtaeus. Aesop's prose fables were also popular.

At first arithmetic was not taught as a mental discipline, but was learned as of practical utility. The Greek symbols for counting were clumsy to manipulate, and calculation was performed on the fingers, or with pebbles, or by means of the abacus. Later, when the educational value of mathematics was better appreciated, geometry as well as arithmetic was taught. Drawing did not become a school subject till the 4th century. Aristotle approved of it, because it trained the eye to appreciate beauty and enabled one to judge the money spent on theideal education. It began at an earlier age than at the Lyceum that boys learned to play. After the Persian War the aulos, or pipe, was in vogue, but later it fell into disfavor.

It distorted the voice. Empedocles (Anab. ii.) could not sing while playing; and its music was held to be exciting. The last reason is the strongest, and harmonizes with the Greek conception that music should be studied, not merely as an accomplishment to occupy leisure moments or entertain a social circle, but mainly as the chief developer of character. For music did more than stir the feelings, it created ethical qualities (Aristotle, Poet. v. [vii. 3]; Plato, Laws, 818).

(5) Music.—Originally music had a wide meaning, and was often used to indicate literature (Plato, Rep. 376 E) as well as music, the narrower sense to which the word came later to be restricted. In Greek schools, music was both vocal and instrumental. Though the music-master was called σάπεντός, it was not on the σάπεντον—a professional instrument—but on the aulos that boys learned to play. After the Persian War the aulos, or pipe, was in vogue, but later it fell into disfavor. It distorted the singing voice. Empedocles (Anab. ii.) could not sing while playing; and its music was held to be exciting. The last reason is the strongest, and harmonizes with the Greek conception that music should be studied, not merely as an accomplishment to occupy leisure moments or entertain a social circle, but mainly as the chief developer of character. For music did more than stir the feelings, it created ethical qualities. The different modes of music produced character in each a particular type of character. The Dorian, for example, was mainly, strong, and dignified; the Lydian, soft and effeminate; the Phrygian, passionate and exciting; the Ionian, very mild; the Mycenaean, mild; the Eolian, with words never alluded to them as the highest. The boys diligently learned by heart the verses of the lyric poets for the purpose of singing. They were carefully instructed in rhythm, taste, metre, and enunciation. It is this belief in the ethical importance of music that explains Plato's and Aristotle's demand for the State to regulate music in the schools, since only thus would proper rhythm and harmony be produced in the soul (Aristotle, Pol. v. [vii. 3] 5 and 7; Plato, Rep. 395 ff., Laws, 654, 812; Polybius, iv. 20. 4).

(6) Gymnastics.—The Greeks attached particular importance to gymnastics to write. Thus, the early period: exactly when, we do not know. From about the age of fifteen or of eighteen, a very large amount of time was devoted to gymnastic exercises; and all through life a citizen was expected to manage himself in training. It was his duty to be fit for war (Xenoph. Memor. iii. 12; Plato, Phaedrus, 229 C), and it was an object of ambition, especially for the leisureed, to possess a fine physical frame. Perfect bodily condition was necessary for good health, and as a basis for a sound and vigorous mind (Lucian, Amochorius, 15).

While using the term γυμναστική, we must distinguish the σαυτερία from the γυμνασμός. The former means, regularly, a private school for train-

---

1 To distinguish the higher subjects from the others, the terms 'secondary' and 'primary' have sometimes been employed. We should, however, remember that, if used, the terms cannot bear their present-day precision of meaning.
The last years of the boy's training were very hard. In regard to diet as well as exercises. And it became clear to the wisest thinkers that this severe physical strain militated against intellectual work. The idealizing, also, of the athlete led to professionalism. Pure athleticism, instead of creating brave and strong warriors, merely brutalized; and the result was a body useless to the State, because disproportionately developed (Aristotle, Pol. v. viii. 4; Eurip. fr. Antioles; Xenophon, Elegies, ii. 1.

While the Athenians sought to foster the exercises that would develop pluck and intelligence, we miss among them what is considered an invaluable part of our school games—the forming of character and the members of which discipline themselves in self-government.

(7) Higher education: the Sophists.—In early days the instruction in ephebic and stadiarchs generally caused when the boy was about the age of fourteen. The sons of the wealthy might then do as they pleased; others must think of fitting themselves to earn a living. We should remember, however, that Athenians of all ages and ranks, though not at school, were always under the intellectual and aesthetic influences of their common life—influences emanating from rhapsodists and actors; from statues and architecture, from dramas and festivals. But about 450 B.C. the feeling arose that ability to read and write, to sing and play the lyre, to recite poetry, was not a complete education. The demand for a wider and more advanced course called forth a supply of instructors in all kinds of subjects—mathematics (comprising the science of number, geometry, astronomy, theory of music); rhetoric, political and literary; the art of disputation, literary criticism; grammar; etymology; correct diction; discrimination of synonyms; geography; natural history; rhythm and metre; dialectic; ethics. For a time the lecturers on these subjects—collectively designated the Sophists—dominated the general or liberal education of Greece. Some of the best known Sophists were Protagoras, Proclus, Gorgias, Polus, Thrasymachus, Euxen, Hippias, and Isocrates. The hoarders who flocked to them were of all ages, and many of the lectures must have been beyond the comprehension of younger minds; besides, some of the accomplishments and general culture (Plato, Rep. 518 C, 600 C; Protag. 314, 318, 349; Apol. 20 B). Plato and Aristotle vigorously assailed the Sophists on the score of superficiality and for believing education to be identical with the absorbing of intellectual results. But what the Sophists taught—especially grammar, style, interpretation of poetry, and oratory—had positive merits. Their method, however, was often marred by their preference, style to matter and of dazzling effect to accurate statement or reasoning (Plato, Protagoras, Gorgias, Sophist; Aristotle, Soph. Elench. i. xi. xxiv.; Aristoph. Clouds; cf. Ephebus, the sportsman, or in extenso.)

The deep interest in education at that period, as well as the searchings of heart amid the conflicting subjects and methods, may be gathered from the theories of education then set forth—Plato's in the Republic and the Laws; Xenophon's in the Cyropedia; Aristotle's in the Politics and the Nicomachean Ethics. Though it belongs to much later times (c. A.D. 100), we may here mention Plutarch's sketch, De Educatione Puerorum.

(8) The ephebus.—On reaching the age of eighteen, the Athenian boy, though he did not yet receive full rights of citizenship, was no longer a minor. The State took complete charge of his training for two years. He had first to pass the scrutiny (debueia) of his township (ephebos), to see if he was of flawless descent and of mature age (Aristotle, Athen. Const. xilii). If he passed, he was registered in the roll (Aephebov orumastos), and was now ephebos.

Though this custom must be ancient, its origin is buried in obscurity. The word ephebus does not seem to occur in literature before Xenophon (c. 370 B.C.); and the earliest of the inscriptions—the earliest sources of information about the ephebe—begins in 324-3 (cf. IV. iv. 517 d).

In the temple of Aglauros the youth swore never to disgrace his arms or desert a comrade; to fight for home and temple; to leave his country better than he found it; to obey the magistrates and the laws; to oppose any violation of the constitution; and to honour the national temples and religion (Plut. viii. 106 f.; Plutarch, Alcibiad. xv.; Demosth. Pol. Log. 346 = 303). The ephebi of each tribe were under a superintendent (upoupsestos), who looked after their discipline and morality. Over all the ephebes and ephebi (see Jebb, Attic Orators, ii. 36 ff.)

1 Notably the work of Isocrates (see Jebb, Attic Orators, ii. 36 ff.)
with a shield and a spear. Any one whose father had died on the field of battle received a complete suit of armour. They now acted as patrols (epheboi), patrolling the frontiers (Xenoph. de Fuf. 2.4). Their duties were mainly guard-house (epheboi). The epheboi of each tribe were in succession stationed at the various points, and thus became familiar with the different localities. At the end of two years they were available for military duty at home and abroad.

Toward the close of the 4th cent. this service seems to have become voluntary, and, as a consequence, restricted to the wealthy. The number of epheboi decreased. Foreigners were admitted, and there was no age-limit. As time went on, intellectual studies were added,—literature, rhetoric, philosophy,—which by and by displaced the military training. We find a staff of professors, numerous students and students' clubs, a library,—in fact, what has been termed the University of Athens, drawing its members from all quarters of the civilized world (see W. W. Capes, University Life in Ancient Greece, 1887).

(9) Girls.—Unlike the Spartans, the Athenians permitted no kind of public education for girls. This was in keeping with the seclusion, almost Ophelian, of the women; the education of the upper classes was kept—a seclusion more or less common throughout Greece except among the Dorians. A girl-wife, fifteen years of age, is described by Xenophon (oeconom., vii. 5) as having been very carefully brought up to see and to hear as little as possible, and to ask as few questions as possible. In Athens, then, what girls learned they learned at home. Though some could read and write, very few received any intellectual training. They were taught to sing, to play the lyre, and to dance; bands of girls danced at the festivals. But it was chiefly in household duties that the Athenian girl was drilled. She must be able to spin and weave, to knit and sew, to cook, to superintend the female slaves, to nurse the sick, and generally to manage the household (Xenop. op. cit. vii. 6 ff.). Wise mothers were also examples to their daughters in purity of life and propriety of behaviour. Neither in private nor in public had Athenian women the status or the influence of their Spartan sisters. Plato's proposal (Rep. 461 ff.), that women should be educated along with men, was extremely audacious. No less was the admission of women to his lectures in the Academy (Diog. Laert. iii. 31). What provision was made in later centuries for female education, we cannot tell. As we learn from Thucydides, even in the last decade, records the selection of three masters to teach girls as well as boys. That the higher learning was unusual for Greek girls c. A.D. 100 may be inferred from Plutarch's epithet recommendation (Conjug. Preceptt, xviii.) that they should study geometry and philosophy, to preserve their minds from frivolity and superstition.

(10) Athens and Sparta.—Contrasted with Sparta, and its narrow but definite aim of creating a nation of sturdy warriors, Athens, while ever keeping in view the needs of the State and rounding off the boy's education with a military training, sought to make of the Athenian a statesman. The Spartans learned reading and writing because of their practical utility; the Athenians held that to hunt everywhere after the useful, is, as Aristotle remarks, to live as a child (met. 3 ad loc.), by no means befitting the high-souled and the free. In Sparta nothing was relied on but continual espionage: Spartan boys, writes Xenophon (Resp. Laced. ii. 11), could never evade a ruler's eye. The Athenians allowed the utmost liberty, and accustomed to the restraining influence of their common civic life (Pericles' speech [Thucyd. ii. 57 ff.]).

EDUCATION (Hindu) —Hindu education was one of the oldest features of their history. The Hindus have been accustomed to associate education, like all the other departments of their social life, with religion. As we shall see (§ 6), the youth of the "twice-born" classes were prepared for admission into the Hindu ranks by a solemn rite of initiation, which was immediately followed by a course of instruction in the sacred literature, dogmas, and ritual of the national religion; and hence they were offered to share with their brethren the privileges and obligations of the caste to which they belonged. This practice, sanctioned by that devotion to usage and custom which is characteristic of the Hindus, and which is founded in the beliefs that guide the course of the Hindu's life, has persisted down to the present day; and, though the people have now readily accepted the system of communal education which the British Government, pledged to an attitude of neutrality towards the multitudinous beliefs and usages of the native population, has organized, the duty of the parent to carry out the religious rites of education and moral training remains unaffected. The difficulty of reconciling the wide-spread desire of the people for the religious and moral training of the child with the danger of State interference with the divergent religious beliefs of its subjects, is one which the Government of India shares with those of many other peoples in the West.

2. Education during the Vedic and Brāhmaṇa periods.—The Vedic literature, composed or compiled by various poets, naturally involved a course of training in the due recitation of the hymns and, as these formule came to be adopted in religious and magical rites, where every word was momentous, and where even the poet of the reciter with difficulty, the system of training to fit the priest or medicine-man for the due performance of his office became increasingly apparent. We thus find in the Veda records of the meetings of nations to discuss religious topics, and of the issue of diplomas to students qualifying them for admission to the sacrificial rites, while those who failed to attain the necessary standard of knowledge were degraded to the rank of plebeians (Dign. x. 71, viii. 103. 5; M. M. Kunte, Pic- states of Aryan Civilization, 1880, p. 129 f.). This form of instruction, as the contents of the Veda underwent the criticism of interpreters, developed into the establishment of various classes of commentators (A. Weber, Hist. of Ind. Lit., 1882, p. 88; H. T. Colebrooke, Essays on the Rel., Philos. of the Hindus, 1858, p. 189; Veyhna Purāṇa, cap. i. iv., tr. J. H. Wilson, 1840, p. 294). The tendency increased, with the advancing development of ritual in the Brāhmaṇa period, when the education of the Brāhmaṇa student (brāhmaṇachārī) became fully organized.

"Instruction in Hinduism is not merely concerned with domestic traditions. The student travels to a distance, and attaches himself to now one, now another teacher of renown; and the wandering student must have learned the little to imbue the Brāhmaṇa with the feeling that they formed a class by themselves, in the midst of the small tribe of people into which Aryan India was at the time divided. This approach, which was at the time a novitate in morals, was a very protracted one, for" science, they used to say, "is infinite"
3. Education among Buddhists. — Among the Buddhists, education became fully organized in N. India, the establishment of the monastic communities gave a powerful influence to education. One of the most important of these seats of learning was the monastery (sahyadhamas) at Nalanda, near Rajagriha, the modern Rajgir in the Patna District, the headquarters of Indian Buddhism, founded by Asoka (V. A. Smith, 

4. Hindu monastic education. — The modern Hindu monasteries (math), such as those of the Jains and the ascetic orders like the Yogis, Sannyasis, or Udasis, are so carefully guarded from intrusion by European observers that little is known of the monastic organization or of the system under which the novices are trained. For a general sketch, see H. H. Wilson, Essays and Lectures on the Religions of the Hindus, 1861, i. 48 ff.; BG xv, pt. 1. 147 ff. The training, such as it is, is supervised by the prior (mahant). High priests, called Tambirans, of monasteries (mattam) in the Tamil country lecture to students (Comm. Rep. Madras, 1884, p. 67).

5. Education under pre-Brahmanism. — When Brahmanism revived in a new and more vigorous form after the decay of Buddhism, the education of the youth was regulated by the code of social duties, the Brahmins, who taught us in the Institutes of Manu and the other law literature, the former being originally a local code which assumed its present shape not later than A.D. 200, and the latter, a vast collection of local codes, including the religious and social life among all the higher classes of Hindus (A. Macdonell, Skr. Lit., 1900, p. 428). The restoration of Brahmanism to popular favour, and the associated revival of Sanskrit learning during the Gupta period, first became noticeable in the 2nd cent. A.D., were fostered by the Western satraps in the 3rd, and made successful by the Gupta emperors in the 4th cent. (V. A. Smith, Early Hist. of India, 1884, p. 287).

The systematic cultivation of the sacred sciences by the Brahmans began and for a long time had its centre in the ancient city of Nalanda, the school which collected the fragmentary doctrines, scattered in the older Vedic works, and arranged them for the convenience of oral instruction in brahins or strings of aphorisms. To the subjects which these schools chiefly cultivated belongs, besides the ritual, grammar, phonetics, the so-called Aghas of the Vedas, the sacred law also. The latter includes not only the precepts for the moral duties of the brahmin, but also the special rules regarding the conduct of kings and the administration of justice (C. Bühler, 'The Laws of Manu,' SBE xxv, Ex., xviii, at the end). A summary of the sacred laws is given under 'Sacred Books of the Aryans,' SBE i, iv, and xiv.

6. Education according to the Laws of Manu.

It must be remembered that this legislation is by no means the only code. Besides the Shatra being forbidden to fulfill the sacred law, except certain portions of it (x. 129, 127); to hear, learn, recite, or teach the Veda (iii. 156, iv. 99, x. 127); to receive spiritual advice from a Brāhman; and in times of distress a student may learn the Veda from one who is not a Brāhman.

The student was divided into three stages: the first stage of learning should first undergo initiation (upanayana), i.e. investiture with the sacred thread (yajnopaveśa) in the fifth year after conception (II. 29); he should be joined to the skin of a goat or a cow, or be-gan as an upper garment, while his under dress should be of hemp, flax, or wool (iii. 11); he should be provided with food by begging under strict regulations, and eat it with special precautions (ii. 468); after the rite of initiation, the teacher (dātari, guru) is responsible for his conduct; he must not instruct his pupil in the rules of personal purity, conduct, fire-worship, and childbirth. When the student has begun to study the Veda, he must sip water in accordance with the sacred law, join his hands (brāhmaṇāśī), clasp the fingers of both hands (I. 741). The rules of behaviour of the person towards his teacher are carefully prescribed. He must, during the period of instruction, i.e. until he is allowed a return (ūpanirasmā) after completing his course of instruction, do what is beneficial to his teacher; never offend him; fetch water, firewood, flowers, cowdung, earth, and the sacred āgra-gras for his use; controlling with the body, speech, organs, and mind, he must stand before him with joined hands; he must eat less than usual for eight days, and must not use less fine garments and ornaments, rise earlier, and go to bed later; he must not converse with his teacher while reclining, sitting, eating, or sleeping; he must not use the rules of meeting and addressing him (i. 106, 144, 192, 1972); whenever personal or material censure or fault; he must cover his ears, or leave the place, and he who defaces a teacher shall be smitten in a heavy fine (I. 201, v. 270). He is subject to various laws, all things excepting only the life being specially prohibited (I. 175 f.). A Brahman who serves his teacher in the absence of his father shall be regarded with the eternal mansion of a Brahman (II. 244). During the course of instruction he must study the whole Veda with the Brahmanas, or some explanations of the Vedic Sanskrit, he is to learn the Upanishads, and perform at the same time various prescribed austerities. He is to be present while his teacher, while under instruction, but provide a suitable reward for the Brahman who is in the condition of a master (i. 10), but a slave is prohibited. He is of the theory that the pupil shall live with his teacher for the fourth part of his life and the second part at home as a married householder (iv. 1). Casting off of a teacher is one of the most deadly sins (ix. 60); and the penalties for violation of the law are very severe, i.e. stones and the like (ix. 235, 237, xi. 49, 55, 104 f.). Such an offender is liable to numerous transmissions into brutes, trees, creepers, or noxious animals; but a form of penance assures purification (xii. 55, xi. 253). Buddhist students on the completion of their course are to be well received, for money gifts, or in any other way as an "impassurable treasure for kings" (vii. 82). The king shall protect the preceptors, and even if he is under instruction; the pupil is incapable of being a witness in a court of justice, and he is relieved from the payment of ferry tolls (vii. 27, 66, 497). Education was thus regarded as a chief stage (āśrama) into which the life of the Hindu was divided (M. Monier Williams, Grammar of the Hindi and Sanskrit Languages, 1882, p. 961 f.). An interesting survival of this rule is found in the custom at a modern Hindu marriage, when the bridegroom makes a formal attempt to start for Benares to undergo a period of study (śūtyātra), from which he is with difficulty dissuaded by his relatives. See a more detailed and analysis of these regulations in Calkuttas Rev. ill. 1845) 210 f.

7. Hindu education in later times.—(a) Under Muhammadan rule.—The effect of the Muhammadan conquest was disastrous to the Brahmin caste; the springs of princely liberality were dried up, many of the sacred texts were destroyed, and the great periodical festivals were in a great measure discontinued (A. Barth, 89 f.). Their sacred places, temples, monasteries, gates, and shrines were in many places destroyed. As an example, when Bakhtiyar Kiliji captured Bihār about A.D. 1267, most of the inhabitants of the place were Brahmins with shaved heads. They were put to death. Large numbers of books were destroyed, and when the Muhammadans saw them, they called for some persons to be killed, but all the men had been killed. It was discovered that the whole fort and temple were a place of study (Sir H. M. Elliot, Hist. of India, 1867-77, ii. 360). The enlightened emperor Akbār, however, was a patron of learning. The imperial government supported the study of several of the sacred books of the Hindus should be prepared (G. B. Malleson, Abhor, 1890, p. 166 f.):
large measure of success in the study of Sanskrit according to Western methods (ib. North-West Provinces, i. 8). The same may be said of Calcutta, now the Dacca and Madras, and founded in 1587, that of the Pandjik, known a little more Sanskrit than a few verbs, which without understanding them he recites at the domestic ceremonies of his clients. The use of English is at once more fashionable and lucrative, and the ambitious student devotes himself to it in preference to Sanskrit.

With the Hindus the decline of their higher institutions is one of the most extraordinary phenomena of the modern times. The belief is imprinted on the minds of the Brahmins that the advanced men of learning have gradually abandoned their study and passed it over to the British, who have voluntarily abandoned a course of study which is looked upon as produced conditions of success. (Rep. Educ. Comm. 60.)

It is, of course, possible that the growth of a spirit of nationality among the Hindus may tend to arrest the decay of the Brahmanical education, but increased attention is being given to the study of the Vedanta, and some enthusiastic believers in it have endeavoured to popularise it in Europe and America as a substitute for the classical type. At the more important centres of Hindu religious life, Benares, Mathura, Nasik, Madras, learned Brahmins still pursue the study of the Vedas on Oriental lines. But the average town or village Brahmin knows little more Sanskrit than a few verbs, which without understanding them he recites at the domestic ceremonies of his clients. The use of English is at once more fashionable and lucrative, and the ambitious student devotes himself to it in preference to Sanskrit.

Hindu education is more popular than ever. The Brahmins have a large number of students, and are anxious to secure more. The British have been kind enough to give them a large number of students, and are anxious to secure more. The British have been kind enough to give them a
at the top of his voice, and the encouragement to noise is found in the fact that the parents often compute the energy of the master as equal to the sound produced from the school. This is no exaggeration. I have myself heard villagers complain that our Government schools lack the swing and energy of the indigenous ones. The school bells ring at 9 o'clock and re-assemble at 2 in the afternoon. The concluding lesson is given at 3 for boys only. This the boys or girls engaged in two rows facing each other, while two of the older pupils are stationed at one end between the two rows, and dictate the multiplication tables, step by step, until the rest of the boys shout after them in chorus. When this is over, the school is dismissed, and the master personally conducts the younger children to their houses. The school nominally meets every day of the week, Sundays included. But the frequent holidays on account of the Hindu religious festivals, and the closure of the school a month on Amawiya or new-moon day and a month before full-moon day, far lessens the weekly and other holidays in English schools. In harvest-time, also, many of the rural indigeneous schools are entirely closed. It is still the practice in some indigenous schools, though taxation is rapidly giving way for, the pupils on the eve of Amawia or Paurnima to perform the ceremony of Kajjaja or state-worship. A quarter of an hour (one farthing), a betel-nut, half a seer (the regulation fee-257 bha. or avondra) of grain, a little saffron and turmeric, and a few flowers are laid upon the soul of each pupil as offerings to Sarassvati, the goddess of learning. Before these are placed the pen, ink-box, and then placed the slate for a few minutes on his head. The master afterwards appropriates the offerings. Crowded, noisy, and ill-regulated as the schoolrooms are, the majority of these schools is able to accomplish the main object, which is to teach reading, writing, and the native mode of arithmetic (166). Our return shows us nearly one-third of the pupils are able to read and write, and that about one-sixth know their tables. These statistics, however, are not based on any examination of the pupils, but on the opinions of the Pandits themselves. It appears to be generally agreed that some improvements inflicted upon the pupils in the indigenious schools are less barbarous and severe than they were twenty years ago. There is still, however, room for improvement in this respect (Rep. Educ. Comm. p. 179). For similar accounts of the methods of instruction, see ib. North-West Provinces. The Code of 1868, c. 24, art. 198. An early account of a Pili school in S. India will be found in the Travails of F. della Via in 1825 (ed. Hakluyt Society, 1862, ii. 287.); for India, generally, see C. O. Rep. Educ. Comm., Madras, 68; S. Mater, The Land of Charity, 1871, p. 154.

9. Origin and development of indigenous primary education.—The question of the origin of this indigenous system of education has been much debated. Though, as we have seen (§ 6), the Sdras were excluded from the education provided for the 'twice-born' classes, it is possible that some kind of elementary education was organized by the village communities; and some authorities, arguing from the character of the instruction provided and the methods by which the teacher is appointed, controlled, and remunerated, accept this view, which is, perhaps, best illustrated by the cultivation of the pupils as regards the United Provinces (Rep. Educ. Comm., Bengal, 383; ib. Panjab, 497; ib. North-West Provinces, 85 f., 236). In Bengal the origin of the village school is connected with the worship of the village temple, in charge of the priest, who, besides his priestly duties that of education. The early history of the schools in Bengal is fully detailed in the report by W. Adam (1638; summarised in Calcutta Rev. J. [1844] 301 ft.). In this province the policy has been to win the conidence of the indigenous schools, to aim at amalgamating them into the State system, and cautiously and gradually introduce improvements (Rep. Educ. Comm. 103 f.). In the United Provinces and other parts of N. India they have been generally replaced by the circle (haldibandi) school, which provides for the wants of a group of villages (ib. 10). Problems of Indian education.—The question of the extension of Western knowledge among the Hindu population is beyond the scope of this article. It is a subject of weighty moment, and is the chief topic of the Report of the Education Commission. It may be well to indicate some of the more pressing problems of education in India which still exist in a great measure await solution. (a) General literacy.—The most pressing difficulty is that, in spite of the efforts made to promote education during the last century, there is still a large amount of illiteracy among the Hindus. Of the total population only 53 persons per 1000 are literate in the limited sense in which this term was used at the Census of 1901; in the case of Madras Province the proportion is only 6% (CI. 1901, pp. 159, 177). The causes which have contributed to this failure are exhaustively discussed by Sir H. Risley and Sir W. Hunter (ib. 1627 ff.; Rep. Educ. Comm., 451). They specially apply to female education (CI. 1903, c. 165 f.; Rep. Educ. Comm. 521 ff.). In 1911 a bill was introduced in the Legislative Council of India by Mr. Gokale for the gradual introduction of free and compulsory education. This proposal was sympathetically received by the Secretary of State (The Times, 25 July 1911); but the state of the finances and the economic situation, which renders the employment of child labour necessary among the agricultural and pastoral tribes, prevent it from becoming, for the present at least, a practicable policy. (b) Jealousy between Hindus and Muhammadans.—The progress of education is at present much hampered by the jealousy between Hindus and Muhammadans, as shown by the controversy whether Urdu, a language which largely combines Persian-Arabic words with those derived from Sanskrit, is to be taught in N. India. (c) The matter of instruction in place of Hindi or other languages of Sanskrit origin (Rep. Educ. Comm. 69.; ib. Bengal, 47 f., 276 f., 395 f.; ib. Panjab, 549). (c) Special education of chiefs and nobles.—The special education of native chiefs and nobles is an ancient problem, Mann (vii. 43) directing that the king should learn the threefold sacred science from those versed in the three Vedas—the primeval science of government, divinities, and knowledge of the Supreme Soul—from the people he should acquire the theory of the various trades and professions. Teaching such as this was imparted by the sage Drona to the Pandava princes in the epic of the Mahabharat. Under the British Government, Chiefs' Colleges, of which the most important are those at Ajmer, Rajkot, and Lahore, have been established, where some of the features of the English public school system have been reproduced, with the object of fitting young chiefs and nobles, physically, morally, and intellectually, for the responsibilities that lie before them (IGI iv. [1907] 435 ff.; Rep. Educ. Comm. 507 ff.). (d) Education of forest tribes and menial classes of Hindus.—The education of the non-Aryan forest tribes and the depressed classes of the Hindu population presents special difficulties. The migratory nature of the semi-savage habit of the Himalayan inhabitants of special schools difficult; but some progress has been made in this direction (Rep. Educ. Comm. 507 ff.; ib. Central Provinces, 3, 191 f.; ib. Bengal, 53 f.). In the case of depressed classes and menial castes special arrangements are needed, on account of the refusal of the higher classes to associate with them in a common school (Rep. Educ. Comm. 513 f.). For instance, only a few years ago the Chanda school was conducted by nearly all the masters resigned on account of the admission of a few Dhar boys (ib. Central Provinces, 2). (e) Missionary and secular education.—Since the time of the Portuguese government, and more especially during the British occupation, the various missionary bodies have taken an active and honourable part in education. W. Carey at Serampore, Dr. Duff at Calcutta, and Dr. Wilson at Bombay are among the many names of those who were conspicuously engaged in translating the Scriptures and other valuable literature into the Indian dialects, and in the general control of schools and colleges (IGI iv. [1907] 409 f.). The older missionaries were strongly opposed to the
native systems of education (Abbe J. A. Dubois, Hindu Manuscripts, Outlines, and Ceremonies, 1906, P. 376 ff.; W. Ward, A View of the History, Literature, and Religion of the Hindoos, i. [1815] 376 ff.). The attitude of the modern missionary is more tolerant, because belief in a knowledge of the variolistic ways of thought is essential to the success of his work. The question of the withdrawal of the State from the control of the higher education was raised before the Commission presided over by Sir W. Hunter; and the policy of the orthodox Hindu party to advocate the dissociation of the State from the higher missionary schools, on the ground that the support of them by Government was inconsistent with the policy of neutrality which is the basis of the Indian educational system (Rep. Educ. Comm., Madras, Summary of Evidence, 176). The missionary view is defined in a series of memorials addressed to the Commission (ib. 303 ff.). The Commission observed (ib. 454):

"Missionary institutions may serve the great purpose of showing that private effort can accomplish and thus induce other agencies to come forward. They should be allowed to follow their own independent course under the general supervision of State. The end of such effort should be, not the support of all, but the support of all, and of every variety of agency in the field of education, they should reconcile private effort among as many as possible will of the Indian people that the mission has constituted the most important of all agencies if educational means are ever to be co-ordinated with educational work.

LITERATURE.—The history of Hindu education still remains to be written. The leading authorities have been fully quoted in the course of this article. For the present aspects of the subject much material will be found in the Report of the Education Commission, with Sir W. Hunter as president, which was issued at Calcutta in 1883, with appendices dealing with provincial details published in the following year. Each of the Provincial Governments issues an annual Educational Report, and these are periodically reviewed by the Government of India. The Report of the General Board gives a statistical basis of the progress of literacy. The Calcutta Review (1844 ff.) contains numerous important articles on the subject, those in the earlier volumes generally reflecting the views of the Serampore missionaries. The official view of the subject is given in the article on 'Education,' TOIT IV. (1867) 607 ff., with a bibliography.

W. CROOKE.

EDUCATION (Jewish).—I. IN OT AND APOCRYPHA.—(1) The child is a conscious figure in the Old Testament. No systematic provision for its training is made, but education is mentioned; but the importance of his personality, and the need of safeguarding his higher welfare and activity, with, that of the community, by wisely planned discipline is recognized. Child-rearing is, therefore, in all communities; there is scarcely a trace; all the ordinances relating to education deal with it, as a preparation for the moral and religious life, as a means of developing character. Similarly, while both teacher and scholar are mentioned in connexion with the musical training of the Levites (see 1 Ch 25;), the professional teacher, as an instructor of the young generally, has no place in the Hebrew Scriptures, unless we are to see a reference to him in such passages as Ps 116(69) and Pr 55; the teacher is the father. In the exceptional case of a child being dedicated from birth to the Divine service, he was made over, at an early age, to the care of the priest, and lived with him in or close by the sanctuary (1 S 2:4). Princes of the royal house likewise had their guardians, who possibly were their tutors (2 K 10:10). A child's education, moreover, to 'schools of the prophets,' in which youths, were trained for the prophetical office, probably by religious teaching and by instruction in music (1 S 10). The moral and religious training of his children became one of the most weighty, if not the father's obligations; and, though no system is prescribed for the discharge of this duty, thoroughness in its performance is attained by the injunction to make religious teaching an integral constituent of the daily life. The father is exhorted to teach the Divine commands 'diligently' to his children, and to speak of them 'at all times'—when he sits in his house, when he walks by the way, when he lies down, and when he rises up (Dt 6:7). Great events, moral, and religious, and especially the anniversaries are to be used as opportunities for impressing the great verities of religion upon the child's mind (4). The Passover is indicated as such an opportunity (Ex 12:26; Dt 6:24). But the entire history of the people is made use of as a basis for religious teaching. The father would recount the 'wondrous works' of God, that 'the generations to come might know them, even the children which should be born, who should arise and tell them to their children, that they might set their hope in God and keep His commandments' (Ps 78:2; cf. Dt 31). Josephus especially instances this study of history as an element in the education of the child in his time (c. Apion. ii. 25). If, as H. Gunkel holds (see the Introd. to his Com. on Gen. 3), the stories in Genesis are sages which were originally told to delight and maybe the primitive parent and child imagine the wondering children as among the listeners, sharing the pride of race and the consciousness of the Divine providence aroused by the recitals.

On the other hand, the maxims of the Wisdom Literature are examples of more formal teaching, not a few of which are addressed directly to the young. Wisdom is declared to be 'the principal thing' ('therefore,') exhorts the Sage, 'get wisdom' (Pr 4). And for him wisdom is moral science, the knowledge of right methods of living. But in his view, the moral life is stable only when it is rooted in religion: 'the beginning of wisdom is fear of the Lord, and the end thereof is with meditation of his ways' (Pr 3:28). It is this higher wisdom which is commended to the young, for their own sake and for the sake of their parents. Wisdom is life (Pr 9), and its possessors win it to their own profit (v. 11), and to the joy of their parents (10). And parents include the mother. 'My son,' says a Sage, 'hear the instruction of thy father, and forsake not the doctrine of thy mother' (v. 12); and the last words of his discourses contain a string of moral precepts of King Lemuel 'which his mother taught him.' The parental doctrine, moreover, must have the child's true well-being for its aim; it must not be subordinated to peculiar teaching, which, 'sits heavy on the child's immediate comfort.' If necessary, discipline must be severe. Even corporal punishment is legitimate; to eschew it is cruelty. 'He that spareth his rod hateth his son' (12). The Biblical maxims on this matter reflect the tone and temper of contemporary thought. None the less, the superiority of moral suasion as a disciplinary influence was fully recognized (see 17).

(2) The educational idea of the Bible receive some development in the Apcrypha. Wisdom is again lauded as the summum bonum, though with greater exuberance of phrase; but it connotes intellectual, as well as ethical, excellence. The fruits of wisdom's labour are virtues, for she teacheth sobriety and understanding, righteousness and courage'; but 'she understandeth' also 'subtilities of speeches and interpretations of dark sayings; she formeth 'alliances between every kind of sounds and times' (Wis 8:25). Astronomy, meteorology, natural history, botany, and medicine are all parts of wisdom (7:24). Education, then, must have included those branches of learning in which all intelligent people at any rate, and, since Ben Sira has some maxims about behaviour at 'a concert of music' (Sir 32), it is probable that music during that period was a subject of study among
the well-to-do classes. It was certainly taught systematically to the choristers of the Temple, and a certain Chananiah is named as one of their instructors (1 Ch 15:2).

2. In the Talmud.—Education looms large in the Talmudic literature. The history and sanctity of training children for the duties of life receive the amplest recognition. The Rabbinic ideas on the subject echo the Biblical teachings. The formation of character is still the supreme aim of training; the fear of God, or, as has usually been expressed, 'the study of the Torah,' directed towards the fashioning of the good life, is still the foundation of wisdom. The child's nature is receptive, like wax in the hands of the teacher; he may make of it what he will. The child, when learning, 'writes, as it were, on clean paper.' Hence the responsibility of the teacher's office and the necessity for beginning instruction early, when receptivity is at its best. Indeed, a passage in the Talmud (Niddah 30b) would seem to imply that the Rabbis were not unfamiliar with the conception of education as a process of drawing out the child's latent capacities through the constant implanting of knowledge ab extra. Before a child is born, they say, he is taught the whole body of religious lore; but at the moment of birth an angel touches his lips and exhorts him. The child should begin to learn as soon as he is capable of being taught. 'Our principal care of all,' Josephus remarks, 'is to educate our children well' (c. Apion. i. 12), and he adds that 'the teaching is to begin in infancy' (Ant. iv. vili. 12). Philo, too, boasts that Jewish children are taught religion in 'their very swaddling clothes' (ad Gaium, 16, cf. 31). The child's inceptive powers of speech were consecrated by being taught to utter simple verses from Scripture. Two such verses are mentioned in the Talmud: 'Hear, O Israel, the Lord is one' (Dt 6:4), and 'Moses commanded us a law, an inheritance for the congregation of Jacob' (Deut. 31:1). The age prescribed for beginning systematic instruction is the fifth or sixth year; at ten the Mishna was studied, at fifteen the Gemara (Talmud) (see Aboth, v. 24; Kethuboth, 50a).

The value attached to education by the Talmudic Rabbis is exemplified by many utterances. 'The world is upheld by the breath of the children in the school-house'; their instruction must not be interrupted during the building of the Temple (Shabb. 119b). The monition, 'Touch not mine anointed ones' (1 Ch 16:13), is allegorically interpreted as signifying the school-children; the exhortation, 'Do my prophets no harm' (ib.), as an allusion to the teachers. 'Dearer to Me, God is pictured as saying, 'is the breath of the school-children than the savour of sacrifices' (Koh. Rab.). 'So long as there are children in the schools Israel's enemies cannot prevail against them' (Ber. Rab. 65). Of a great Rabbi it is told that he would never break his fast until he had taken his child to school in the morning (Kid. 30a). The teacher's office is regarded with the utmost veneration. Rabbi Judah, 'the Prince,' when, on a pastoral visit, asks for the watchmen of the city; they bring him the beadle and the town-guards. He rebukes them; 'Not these,' he says, 'but the inns where the children are taught' (Jer. Hag. i. 7). Teachers must be married, males, and of unblemished character. They must not hesitate in speech, and must be painstaking. One teacher, who was known to have laboured hundreds of times until the pupil had mastered it (Edu. 20b, 21a). The teacher is warned against favouritism, especially against making a distinction in favour of the children of rich parents, and also against bad temper (Ta'amith, 24a). 'An irritable man cannot teach' (Aboth, ii. 5). The teacher, moreover, is to beware of compromising his dignity before his pupils; he should not jest, nor should he eat or drink in their presence (Yore Deah, 2b).

Systematic provision for the education of the young seems to have existed in Palestine at the beginning of the Christian era. Simeon ben Sheṭaḥ, the president of the Sanhedrin, decreed that children should be taught at school instead of being instructed at home by their parents as hitherto. The inadequacy of the father's instruction, and regard for the educational needs of orphans, necessitated the ordinance. A century or two later this school system had extended from Jerusalem to all parts of the country. The credit for the extension is given to one Joshua ben Gamla, a hierarch (Bab. bath. 21a). The Greek terms ψυχονομι and ψυχαγωγες often meet us in the Rabbinic literature. Whether the school in the Talmudic age was anything more than a religious school is very doubtful. The 'three Rs' and, it would seem, the four (Greek, Hebrew, Semitic, and Aramaic), mathematics, astronomy, and gymnastics were also learnt by children; but all, or most of them, at home. Among foreign languages the Talmud (Meg. 15b) and the teacher's preference for the beauty of Japhet (the Aryan races—a reference to Gn 9:5), 'the language of song.' The parent was further enjoined to teach his boys swimming and also a cleanly trade (Kid. 39a, 29b). He who does not teach his son a trade virtually teaches him to steal (ib.). In the schools, however, the Bible and its Rabbinical interpretations were the chief, if not the exclusive, subjects of instruction. Mention is made of tables on which the letters of the alphabet were written for beginners. These tablets were of two sizes, corresponding to the modern slate and blackboard. The elder children learnt from scrolls. Home tasks appear to have been set (Kid. 30a). The school was held either in the synagogue itself or in some adjoining building. It was kept open all day and long after nightfall; even on the Sabbath it was closed for only a small part of the day. The scholars were taught in unextenuated mechanical relays—an unpractical arrangement which necessarily led to confusion and to needless labour on the part of the teacher. A Rabbi of the 4th century, directed in the exercise of the instructions of instruction were limited to five daily, and were fixed for the early morning and the evening (Eruvin, 54b). An average class consisted of twenty-five children; if the number reached forty, an assistant teacher was appointed. The pupils sat on benches arranged in a semicircle, so that each child might see and hear the teacher. The teacher was sometimes the reader (ḥazzan) of the synagogue, sometimes a Rabbi, who might be very eminent indeed. Discipline was to be maintained, but punishments should be mild. For physical chastisement a light strap only was to be used. Persistent disobedience was not to be visited with expulsion; the offender was rather to be subjected to the salutary influence of his more tractable school-fellows. Lenity was preferred to rough measures. 'Bespulse the child with the left hand; draw him, but do not pluck him.' The stimulus of rewards was also recognized. One Rabbi is said to have distributed sweetmeats as an incentive to the smaller children. In the earlier Talmudic period, less effort was paid for their work; its performance was regarded as a pious duty. By the 2nd or 3rd cent. payment was made for instruction in reading, but it was still deemed improper to accept a salary for religious instruction. Later teachers, however, the self-denying rule had to be relaxed. The teacher, when un-
paid, was exempt from public service and from taxation. Synagogues and provision for higher religious study also existed in the Talmudic period, notably in Babylonia. The academies of Sura and Pumbeditha were famous.

3. In the Talmudic period Jewish education, ideals and methods varied with the fortunes of the Jews themselves. Tolerant treatment and a civilized environment yielded fruit after their kind in Jewish culture, of which a liberal education was the necessary condition for higher religious study. In Spain, under Muslim rule, the Jews evinced a marked enthusiasm for secular learning, without, however, losing their traditional love for Hebrew and religious studies. It was otherwise in Christian countries. In France, which, so far as the Jews were concerned, included England during the centuries immediately previous to the expulsion under Edward I., and in Germany, Jewish education was, generally speaking, at a low ebb. The Jews, proscribed or ostracized by their neighbours, were thrown back upon themselves, and forced to seek their intellectual sustenance elsewhere. In their religious literature, the example of the general population, even if they had been accessible to its influence, have enlarged their educational outlook. When even elementary learning was confined to the clergy of the Church, as it generally was, there were at least some exceptions. Nor would the famous Talmudic era, which preceded the Christian era, without some exceptions, the Jews of Northern Europe should have shown no ardor for profane knowledge. On the other hand, their zeal for the one possible study was intensified; the stream was all the deeper because it was shut up in a narrow channel. Nor was this limitation of intellectual ideals unmixed loss. Immersion in the study of the Talmud, with its keen dialectic, sharpened the Jewish mind in its religious literature, and made it take full advantage of social and intellectual enfranchisement when its hour struck. Every congregation had its communal school supported by the contributions of the members. Instruction was also given by private teachers either in their own homes or at the houses of the pupils.

The act of bringing the child to school for the first time was elevated into a solemn rite. It took place when the child was five or six years old, and preferably on Pentecost, the Feast commemorative of the giving of the Law at Sinai, the prototype of the child's induction into the knowledge of the Law. To the ictory vestments, he was brought into the synagogue, and the Decalogue was recited as the lesson for the day. Then he was taken to the teacher, who thereupon began to teach him the Hebrew alphabet from a tablet smeared with honey which the child ate as he pronounced the letters, so that the sacred lore might be sweet in his mouth. The solemnity of the ceremony foreshadowed the character of the entire course of instruction, which was made a very momentous business, rarely interrupted by holidays or games. 'For there was no greater disgrace than that of being called an *am ha-arets (an ignoramus)!' Having mastered the Hebrew alphabet, the child was taught to spell and to read. Thus three months passed, at the end of which he was taught passages from the Bible and the Prayer Book, which took up a second three months. The lessons were supplied by the three introductory chapters of Leviticus, which treat of the sacrifices, whose purity matched that of the child. But a merely superficial familiarity with the sacred text did not suffice; for six months were still needed. The lessons, of Genesis, both of the Pentateuch and of the Prayer Book, were of Leviticus, in the vernacular. A knowledge of writing the vernacular would also seem to have been imparted, but this was probably acquired in the Jewish school, from the child's own parents.

It was called the 'Christian script.' Hebrew grammar was usually neglected. The pupil, after some time, gave his lesson, swayed his body to and fro as old-fashioned Jews still do at prayer, and used a peculiar sing-song or cantillation. At the end of the first year, he was taken from the Pentateuch to the Prophets and the Hagiographa. And when he had come to the fourth year to the Mishna, and thence to the Talmud. Lessons began at an early hour of the day in the winter while it was still dark—and continued till the night, so that the children would either go to the synagogue or attend service in the teacher's house. After breakfast at home they returned to school, and lessons went on again until eleven o'clock. Then came morning prayer, on which occasion recitation was resumed once more, to last, with a short interval in the afternoon, till the time of evening prayer, which closed the school day. At the age of sixteen, in the fifth year to the study his vocation, his Wanderjahre began, during which he visited various towns in turn, in order to sit at the feet of famous teachers. This extended course of study was not undertaken only by those who intended to become his teacher or scholar. A Jew must fire many a youth who could hope to gain nothing from his study save the knowledge itself. Even the Rabbis would scorn all pecuniary remuneration, and would regard it as shameful to use the Torah, in Talmudic phrase, 'as a spade to dig with.' They relied for a meagre livelihood upon some secular occupation, often the humble calling of the artisan.

Gildermann (op. cit. supra, vol. i, p. 922) reproduces from an Oxford MS an interesting scheme, dating from the 16th cent., for founding a systematic course of Jewish instruction in the north of France. This system commences with primary schools for the children of the upper and a lower school, suggested respectively, perhaps, by the cathedral schools and the parish schools which existed in France at that period. The document mentions an order of students which it styles the 'separatists' or the 'disciples,' because they have made religious study the chief or sole occupation of their lives. For these the upper or 'greater school' is to be instituted. That, 'saying the Talmud, the scheme premises, 'is the true learning for which a man slays himself'; so the student must give himself wholly to study, taking up his abode in the seminary so as not to lose time in coming and going, and remaining there seven years. It is the duty of the student to read the Talmud, the tehillim, and the Pentateuch, one of his sons to this holy vocation, just as he set apart a portion of his property to the service of Heaven. The lower school was intended for day-scholars, which were to be supported by the community, each member of which is to subscribe twelve denarii a-year. These subscriptions were to be supplemented by the fees of the pupils. The staff is to consist of a rector and tutors, of whom the former is to lecture to the students, and the latter to be given over to the instruction of ten pupils, in contradiction to the twenty-five prescribed by the Talmud, 'which was intended only for Palestine, where the climate favours mental development, and for times when Jews were free'; for, the author of the scheme adds pathetically, 'the free are strong and clear of brain, and absorb knowledge more readily than do the downtrodden, whose higher energies are sapped by service of cruel masters.' The pupils are to be taught from a book, not from voice, and they are to be encouraged to hear each other's lessons every evening as a means of sharpening their intellect. Systematic repetition is recommended. In winter only a fourth of the night is to be devoted to the instruction, for lights for the student, however, is at liberty, when he so desires, to spend the entire night in private study. Only promising pupils are to be retained in the school. If a boy proves to be dull, the rector should send for the father and discreetly say: 'God aid thy son to do good deeds in future; but the teachers are not to follow any other occupation; they are to live in the upper school all the week, returning home for the Sabbath only. They must have a special suit of clothes for school hours, so that they may teach in unsullied garments, as befits the sanctity of their task.'

As in the Talmud, so in the medieval literature generally, much stress is laid upon moral and religious training as the final aim of education. The "Book of the Pious" (Sepher Tsaddiuk [13th cent.]) is full of moral maxims and translations of Greek hymns and psalms. Children copy their parents; if the latter are dishonest, they will be dishonest too, and all study of the Torah is useless. They are taught to give children clothes, food, and drink. A wealthy father, whose children do not heed moral and religious precepts, should see that they work for a living;
perhaps they will be brought back thereby to the right path. . . . Even if a child can only read, he should be made to understand what he reads. When he reads the Bible, the teacher should strive to arouse his pietý. He should tell him that he is reading the Word of God. Eventually, he should be told of everlasting rewards and punishments. . . . In choosing an occupation for his son, the father should have regard to the book he wishes his son to read. It is disposed to the study of religion seriously, let him be dedicated to it; but if he would study from books, let him rather be taught some secular occupation.' Then some rules about education generally meet us: 'A teacher must not encourage a synag, or gossip either in or out of the school. He must not be evil. "As I have to teach all day, I will rise early and study for myself!'; for he makes good progress in Bible, do not force him to the Talmud. If a child stammers, he should be told to bring his questions to the teacher after the pupils have gone away, or to bring them in writing, so that he may not be mocked at by his school-fellows.'

Maxims of similar import are to be found in all the medieval rabbis, and they are given in a prominent place in the 'ethical wills' which pious Jews were accustomed to leave—not seldom it was all they had to leave—for the edification of their children. Most teachers, moved doubtless by the doctrine of 'Proverbs' and the Talmud, put in no plea for corporal punishment; but they are careful to add that it must be used with discrimination. On the other hand, a famous Rabbi of comparatively modern times, Jacob ben Zalman (heder cent.), left women in his ethical will that those of his children who were addicted to scandal-mongering or untruthfulness should be unmannerly chastised. Another ethical will, to which we may here refer, though its origin was Spain, is that of Judah ibn Tibbon (12th cent.).

Judah reminds his son that he travelled to the 'ends of the earth' to find teachers for him in sciences and other profane studies. He exhorts him to read every Sabbath the weekly lesson from the Pentateuch in Arabic in order to perfect himself in that language. He is to take great care of his books, so that he does not scant them or damage or make tachy books; he says, 'thy companions, and thy library thy garden. Pile the fruit that grows therein; gather the roses, the spices, and the myrrh. If thy soul be satiate and weary, roam from one bed to another, and desire will renew itself.'

Knowledge, however understood, was a precious thing to every Jew. A father would deny himself the common necessities of life in order to secure for his son a good education. This self-denying zeal still characterizes the Jewish poor-to-day.

On the other hand, the standard of education for girls was distinctly lower than that in the case of boys. In this respect the medieval Jews fell below the level of their Christian neighbours. The Talmud (B. Talm. 21b) deprecates the study of the Talmud, and the medical Rabbis fully shared this attitude. It was the custom to marry girls at a very early age, and there was, therefore, little time, as well as small inclination, to give them more than a mere smattering of religious knowledge. Attention was concentrated upon their domestic training and upon instructing them in those precepts of the ritual law which would especially concern them as wives and mothers. The average Jewish girl in the Middle Ages knew little or nothing of Hebrew; and, even if she was able to read the Prayer Book, she did not understand it. Thus we find Jewish women generally, in common with illiterate males, recommended by the authorities to pray in the vernacular. Later on (about the 15th cent.) the vernacular took the form of a jargon, in which devotional and religious books were written for their especial benefit. While the latter attracted the attention of these narrow educational ideals, their morals remained unaltered. Female excellence was maintained at a high level. The Jewish woman wielded great influence, not only in the home, but also in circles of religious culture which she was not permitted to share; her greatest pride was to have sons learned in the Torah. She was, above everything, modest and chaste, and she could immolate herself as a martyr when the need arose. Occasionally, too, she could break her traditional bonds, and give herself to study. Jewish literature is replete with examples of learned women, later Huldahs, to whose knowledge and opinions distinguished Rabbits did not disdain on occasion to appeal, and even of women who taught boys and preached in the synagogues. In the ethical wills already mentioned the Talmudic's daughters receive the same attention as their sons in the matter of moral training.

Among the Jews in Muhammadan Spain, education, as has already been said, received a wider interpretation than it enjoyed among their brethren of Northern Europe. Joseph ibn Aknin of Barcelona (15th cent.) recommends the following subjects of instruction to be studied in the order named: reading, writing, Torah, Mishna, Hebrew grammar, poetry, Talmud, religious philosophy, logic, mathematics, astronomy, music, mechanics, medicine, and metaphysics. Jewish literature of the Spanish period is witness to the importance which was attached to the knowledge of these subjects, and of its authors, and therefore to a high educational standard. Whether Rabbi or man of business, the Spanish Jew was often a poet or a philosopher, sometimes a physician also. In Italian Jewry, which was more seriously influenced by the intellectual practice, a strong desire for secular learning manifested itself. It was discernible before the Renaissance, and when, in the 16th cent., intellectual darkness had descended upon the Jews of Germany and Russia, a sketch of a curriculum was framed by David Provenzale in Mantua which, besides the usual Hebrew and theological subjects, includes Latin and Italian philosophy, medicine and mathematics.

As time went on, the general standard of education among the Jews in Northern Europe deteriorated rather than improved. By the 15th cent. it reached its lowest point. Young children were handed over more frequently than before to the private teacher, who was often only a little less ignorant than his pupils, and who taught his class, without method or discipline, in an overcrowded and stuffy room (heder)—an arrangement which still obtains in Russia, and is favored by the Jewish immigrant from that country into England. A boy remained in the heder until he reached the age of thirteen, the age of religious responsibility (bar-mitzvah), the advent of which was marked by his publicly reading a passage from the Pentateuch in the synagogue, and by his delivery of a small Talmudic passage at a regular meeting of the boys to an assembly of his friends at home. With the age of Moses Mendelssohn (18th cent.), however, a new intellectual era dawned for the Jews of Germany and of Europe generally. Mendelssohn's great aim and work was the rescue of the Jewish mind from medievalism, and among the first fruits of his influence was the foundation in 1778 of the Jewish Free School in Berlin, where the instruction embraced Hebrew, German, French, and the usual commercial subjects. About the same time a movement aiming at the improvement of Jewish education, favoured by the tolerant policy of the Emperor Joseph II., was initiated in Austria. The efforts of the reformers in all countries had a two-fold direction; secular teaching was to go hand in hand with Jewish instruction, but the scope of the latter itself was also to be enlarged. The tuition, more or less annually paid in Jewish schools, by which it had hitherto, as a rule, been restricted, was to be supplemented by systematic instruction in Jewish history and theology. Text-books on these subjects which hitherto were almost unknown, now appeared in rapid succession. Greater regard was likewise paid to grammar in the teaching of Hebrew. Technical schools, moreover, began to
spring up. Since that time Jewish educational ideas have gradually widened in all countries where civilization co-exists with religious liberty. In Russia and Roumania and Turkey, those ideas, once shut in, are now being brought into the light of public life. The Russo-Jewish Association in London and the Alliance Israélite in France are still antiquated; but elsewhere, there is as much education as there ever was. The aims and methods from those of other religious bodies. Even Palestine, hitherto the home of reactionary tendencies, gives evidence of an educational awakening. Enlightened conceptions of teaching and a liberal curriculum are becoming the order of the day; secondary schools are springing up, and, in Jerusalem, there are to be found an arts and crafts school and a normal school for teachers. In Europe the latest tendency is to entrust the secular teaching of Jewish children to the State or to the municipality, and to restrict voluntary education to instruction in Hebrew and religion and cognate subjects. The Jews, taxed as citizens for the maintenance of general elementary and secondary teaching, deem themselves discharged from the duty of making special provision for the secular instruction of the children of their poor. They are concentrating their efforts on the higher degrees in the hope of securing the conservation of religious training. This tendency is especially marked in England, where the first Jewish school was founded in London about the middle of the 17th century. Both these bodies, however, had to expect before any attempt was made to add some rudimentary secular teaching to the ordinary elements of Jewish instruction. At the present time, they both conduct Jewish instruction in their schools, including the great 'Free School' in Bell Lane, Spitalfields, with its 3000 scholars, in the metropolis. State-aided, they provide secular as well as religious instruction; but, while they are supported with hardly relaxed generosity by the Jewish community, no disposition is manifested to increase their number. The religious education of the many thousands of Jewish children who now attend the public elementary schools is undertaken by the Synagogue, with its various classes connected with the various places of worship, and, in London, in addition, by the Jewish Religious Education Board, which maintains an organization of religious teachers at certain County Council schools, mainly in the East End, where Jewish children form the great majority of the scholars.

MORRIS JOSEPH.

EDUCATION (Muslim).—I. Education in the early history of Islam.—The value set upon education in Islam is indicated by certain hadith sayings which, though they may have no claim to rank as authentic, yet undoubtedly reflect the educational ideals of Islam in its early days, and may be taken as representing the prevailing views of the first generations. Thus it is handed down as a saying of the Prophet himself, that 'A father can confer upon his child no more valuable gift than a good education'; and, again, 'It is better that a man should secure an education for his child than that he bestow a ā’ād in charity.' The books which recommended extend also to slaves. It is regarded as a work of special meritious character 'to educate a slave-girl well, then set her free, and give her to a husband.'

It may be safely said that Islam raised the Arabs to a higher level of civilization and the same time increased the elements of education, in which they had hitherto been rather deficient. That Muhammad himself—partly, it may be, on utilitarian grounds—attached considerable importance to this; and the most indispensable elements of knowledge, may be inferred from the conditions on which he released prisoners of war after his victory at Badr. He employed several Quraishi captives to teach the boys of Medina to write, and this service counted as their ransom. Twelve boys were assigned to each of the Meccan prisoners who were capable of giving the required instruction, and, as soon as the pupils had attained the stipulated degree of progress, their teachers were set at liberty. The Quraish, as a people largely engaged in commerce, had naturally more occasion to practise writing than the date-planters and husbandmen of Medina, and it was, therefore, easier to find penmen among them than in Yathrib—a consideration which may perhaps also dispose us to accept the view held by certain Muslim theologians, though condemned as reactionary by the orthodox, that Muhammad was not the 'illiterate' that Muslim orthodoxy, with its mistaken interpretation of the epithet ummi, tries to make out. Mention is even made of a list of contemporary Jewish women who were familiar with the art of writing; but this group did not include the youthful 'Aisha, who, though she had the advantage over her companions in being able to read, yet had never learned writing. This may have been due to the fact that among the men of Mecca the ability to write was nothing out of the common. Mu‘awiya distinguished himself as the Prophet's secretary. Feudanship was not quite so common among the Arabs of Medina. To the Khayrattyb Ubayy b. Ka‘b, who made a name for himself by recording the revelations of the Prophet, is ascribed the exceptional distinction of having been skilled in penmanship before the rise of Muhammad. In Medina, those who, in addition to certain other accomplishments, possessed also the art of writing—acquired perhaps from the Jews resident there—and were deemed worthy of the title of kāmil ('perfect').

It would also appear that, once the young Muslim community had been constituted, a primitive system of education, embracing at least the bare elements of knowledge, was set on foot. In no long time we begin to meet with references to the kniatāb ('elementary school'). We would cer-

Leyden, 1705), i. 128, where the reference is not to Arabs in general, but to natives of Medina. For the full connotation of kāmil, see Ibn Ša‘ā, v. 819, line 7.
attention to his work. The mu'addib (‘instructor’) was a standing figure at the mosque, and was admirably supported in his work by the fathers of the princes.

One of Omar's most famous pupils was the poet Maimun al-Dardâ (c. A.H. 74-77 = A.D. 693-6) who was sent to the Prophet's school of kuttab to receive a formal education (μαθήματα). Maimun, who was later to become a famous poet, was a brilliant student who was able to grasp the essence of the Quranic lessons in a single day. He was later to become the tutor of the Prophet's daughter Fatimah, and was the author of some of the most beautiful poetry in Arabic.

Another pupil of the Prophet's school was the poet Anas ibn al- Hãyrâs, who was later to become a famous poet andiggs, and was one of the most famous poets of the Abbasid period. He was known for his skill in the art of writing, and was a master of the Arabic language.

The development of scientific knowledge under the Abbasids is one of the most important aspects of their rule. They were the first to establish a scientific academy, the Madrasa, in Baghdad in 731 A.D. This academy was the first of its kind in the world, and was modeled on the Greek and Roman academies of the time. The academy was a center for the study of the sciences, including mathematics, astronomy, and medicine. It was also the first to establish a system of examinations, which were held every four years.

The Abbasids also supported the study of the Quran, and were the first to establish a system of Quranic schools, known as the kuttab. These schools were established throughout the Muslim world, and were the first to establish a system of standards for the study of the Quran. The Abbasids also supported the study of the Arabic language, and were the first to establish a system of standards for the study of the Arabic language.

The Abbasids also supported the study of the Islamic sciences, including law, medicine, and philosophy. They were the first to establish a system of examinations, which were held every four years.

hospitals now being instituted—served as they were by the most renowned physicians of the day—
attacted students of medical science, as is shown by numerous references in Ibn abI Usālī's 'Alī's
Biography of Physicians. In the present article, however, we propose to steer our discussion
largely to elementary education.

2. The subjects of primary education: forbidden
books.—In a series of sayings showing no trace of theological influence, added to the
subjects which should have a place in the education of children, Khalīf 'Omar 1, for instance, is said
to have counselled parents in these words: 'Teach
your child to swim and to throw darts; charge
them that they must be able to mount a horse
securely, and make them recite appropriate verses.'
'Omar was himself a renowned horseman, and is
said, in picturesque phrase, to have sat in the
saddle 'as if he had been created on the horse's
back.' Amongst these attentions the art of
swimming was specially prized. Khalīf 'Abdalmalik
gave his sons' tutor the following injunction:
'Teach them to swim, and accustom them to sleep
little.' Ḥajjāj (who, according to another report,
laid most emphasis upon the religious training of
his children, and therefore refused to engage a
Christian teacher) gave a similar charge to the
proponents of his sons; he was to be the expert
in this art. 2

"Instruct them in swimming before you teach them
writing, for they can at any time easily find one
who will write for them, but not one who will
swim for them.' Jahiz, to whom we owe this item
of information about Ḥajjāj, supplies further
details indicative of the importance attached to
the art of swimming in the educational practice of
the higher ranks. A saying of Ibn al-Tamān
commends swimming with other accomplishments,
and swimming as one of the accomplishments which, above all others, a
prudent father should seek to procure for his
children. As between writing and arithmetic, the
latter should have precedence, since it is not only
of more value in business, but is actually more
easily learned, while its eventual advantages are
also greater. 3 The traditional view, with a slight
variation, finds expression in a modern Arabic
proverb current in Iraq: 'Learn to write, to make
the calamus, and to swim in the river.' 4

It would, of course, be absurd to suppose that
the educational maxims which assign so prominent
a place to swimming had their origin in Arabia,
that country could provide but little, or be unimportant
for practising the art. 5 The present writer is of
opinion that—as is suggested by the grouping
together of riding, dart-throwing, and swimming
—all these educational ideals were largely influenced
by foreign, and especially Persian and Greek,
views; and, indeed, the pedagogic maxims in question are but the echoes of such views. 6 In
general, the importance ascribed to swimming is
doubtless due to its trace to Greek ideas: to be able
'neither to swim nor to read' (μηδέν ενυ μήατο τοιούτοι ή τοιούτοι)
was in Greek equivalent for the absolute lack of culture. It was
likely that the foundation was laid, not in the
educational maxims of the Talmud, 7

The subjects recommended in the sayings just quoted form no part of the distinctively
Muslim theory of education, which was governed
by principles of an entirely different character. The

7 The like holds good of the kāmil lq
(see above, p. 1097).
8 Bab. Qiddash, fol. 294. general course of training for young males is set
forth in the hadith as follows:

"On the seventh day after the child's birth, the 'āqiqah ("hair-
cutting," together with the sacrifice of an animal) is performed,
and he is taught his name and is made ready against all harm
when he is six years old, his education begins; at the age of
seven, he is given the use of sleeping-place and toilet. When he is
eight years old, he receives corporal punishment when he omits his
prayers; at sixteen, his father gives him in marriage, then he leaves
him to himself. I have given you in marriage; now I beseech
God for help against evil in this world, and against your being punished in the Last Judgment." 8

As regards the elementary curriculum in partic-
ular, the relevant sources furnish us with the
following data. When the child begins to speak,
he should be taught to repeat the Muslim article
of belief, Lā ʾālāka ʿlā Allāh; he must then learn
the words of Qur'ān, xxiii. 1176: 'Exalted is
Allah, the King in truth; there is no god but Him,
the Lord of the stately throne of Heaven'; then
the 'throne-verse' (ṣütāl al-kurṣī, ii. 250), and
the last two verses of sūra lix. (ṣütāl al-jadhr): 'He
is Allah; there is no deity but Him, the Holy
King,' etc. This is the order in which the children
so early taught should not be brought to judgment by God. 9

At the age of seven, when the child becomes responsible for the
ṣütāl, he is to be sent to school, and the teacher
must begin to instruct him systematically in the
Qur'ān. Ḥe must learn the one Surah a day, or the
school before the age of seven, as is the practice
of some parents, who wish merely to spare themselves
the trouble of looking after their offspring. 10

The teaching of the Qur'ān should be supplemented
in the more important religious precepts and
usages: the proper response to the ʿādām, the
different kinds of washings, the prayers in the
mosque to which children should be taken when-
ever possible; they must without fail be familiarized
with the practice of joint-prayer (ṣūrāl al-jadhr),
even in the school, where one of the older boys
acts for the time as leader in prayer (imām).
Instruction in reading and writing, of course, must
also be proceeded with. The children practised
writing on tablets (lūb, pl. lūwāb); the words
employed were usually taken from passages in the
Qur'ān.

The Juhair (f. A.D. 1744 = A.H. 1271), in his sketch of the state
of education in Damascus, says that in the elementary schools of
that city—where writing (ṣūrāl) and recitation (juzā') of the
Qur'ān were taught by different masters—it was the custom, when
exercise in reading and writing were taken, not from the Qur'ān,
but from poetical or religious works. 11 The instruction of
writing heard words from the tablets seemed to cast dishonour
upon the sacred book. The cleansing (ṣanūr) of the
students marked the close of the first period of daily
exercise. It was an allotted hour for this eight o'clock a.m., and
the master must then grant the children a short pause (tārīkh),
which contained the practice of wiping the scribbling
material when they contained verses of the Qur'ān;
various precautions are recommended by the more strait-
lined theologians. It must be performed in a clean and well
guarded place, not open to be trodden upon, so that the water
used in wiping out the sacred words shall not subsequently
suffer any contamination. The best way of disposing of the water
by pouring it into a river or a pit, or to collect it in a vessel for
those who wish to use it medicinally, as it is believed to possess
magical virtues. A pious resident of Cairo, Muhammad
Jāhān al-Dīn (f. A.D. 1807 = A.H. 1207), who founded a school in the
Qur'ān, inserted in the Bani Qara as dead of foundering, an
expression that the water used in that institution for cleaning the writing
material was to be poured upon his grave. 12 Even the pieces of rag
with which the tablets were wiped must be burned out with the
best care, lest the water that dripped from them should be
profaned. 13

Concurrently with exercises in reading and writing from the Qur'ān, the pupils were taught the rudiments of arithmetic. To these were added

8 Madkhal, loc. cit.
also legends of the prophets (ahādīth al-anbiyā') and anecdotes from the lives of godly men (hikayāt al-sālihīn). 1 In early times the parts of the hadith most in favour for educational purposes were the legends about the Deccanis (Dīwān), by which this is probably meant the traditions regarding the Mahdi period and the Last Things. Finally, the children had to learn selections from the poets; and with the curriculum secure to have reached its term. In an ordinance regarding the education of the young, 'Omar b. enjoining that popular proverbs (al-anāmāl al-sā'ira) and beautiful poems should form subjects of instruction. 2 As regards the kind of poetry to be selected for children, the writers who discuss the course of elementary education are all most emphatic in demanding that moral pieces alone should be allowed. In that respect, Vajājī was of the view that such a subject should be strictly excluded. It is interesting to read what the philosophers—to leave the theologians out of account—have to say on this subject.

In Tāsin (Avicenna) recommends the following course of instruction: 3 'When the boy's limbs have become firm and he has attained some readiness of speech, when he is able to assimilate all kinds of materials of knowledge, and his ear has become perceptive, he should begin to receive instruction in the Qur'an, the letters of the alphabet should be drawn for him to copy, and he should be taught the principles of grammar. regards poetry, it is desirable that the boy should acquire the rhythm of sound and the melody of the syllables; the recitation of the rajaz in easier and its retention in the memory more certain, as its verses are shorter and its metre simpler. The teaching of poetry should commence with pieces which find themes in the advantage of good morals, the praise of science, the reproof of ignorance, and the rebuke of stupidity, and which enforce the honouring of one's parents, the practice of hospitality, and other noble qualities. The Mikāsini reproaches parents for teaching their children to recite licentious poetry, to repeat the lies found in such poems, and to take pleasure in what they tell of vicious things and the pursuit of lowness, as, e.g., the poems of Imam al-Qazwīnī, al-Suhbī, and others like them; one who taught will go to heaven in the face of God and will have the privilege of choosing his companions in Paradise.

The strictest with which the young were guarded from the influence of erotic poetry will not surprise us when we remember the attitude of the Sunni theologians towards narrative literature. The name of the fanatically orthodox theologian of the 11th century, A.D., people are warned against the possession not only of metaphysico-theological and philosophical works, but of other writings, and especially of such frivolous books of the day. Contracts relating to such literary products are null and void. Writings of this character should never be destroyed by fire and water. 4 Muhammad al-'Abdari goes so far as to maintain that a paper merchant should not sell his wares to one who, to the best of his belief, will use the paper for reproducing the stories of 'Antar or Sidi Batâl, and similar tales, as the diffusion of such writings falls under the category of makhâihat ("reprehensible things").

There were, however, other grounds upon which certain kinds of poetry were withheld from the young. Thus 'Abdallâh b. Abî Ṷâlî forbade his children's tutor to read them the gazīdas of 'Urwa b. al-Ward, as they might thereby be incited to leave their native soil and seek 5 Nāwawī, Tuhâhid, ed. Wüstenfeld, p. 229, line 6 from end.

In order to gain the prestige of authority for this more favourable view of the teacher's calling, attempts were made to trace it likewise to utterances of the Prophet himself. Al-Qurtubi (ed. A.D. 1272), the great commentator on the Qur'an, gives his imprimatur to such a deliverance, viz.

The best of men, and the best of all who walk the earth, are the teachers. When religion falls into decay, it is the teachers who restore it. Give unto them, therefore, their just recompense; yet use them not as hirelings and as their hire. For, as often as the teacher bids the boy say, 'In the name of Allah, the Most Magnificent,' he repeats the words after him, God writes for the teacher, and for the boy and his parents, a record which shall surely save them from the Fire.1

It is true that the scholar who thus lent his sanction to a hadith2 usually branded as apocryphal an Amalasian. In Amalasian Islam, a double, a higher value was placed upon the function of the teacher than was the case in the East—a result due in great measure to the flourishing system of elementary education that had grown up in the Western khilafah.3 Here, therefore, the alleged utterances of the Prophet in honour of teachers could, e., to be more favourably received. The same thing holds good of Islam in Sicily.

Speaking of Palermo, the Arab traveller Ibn Hawqal (ed. A.D. 967—A.D. 977) puts on record that he found over three hundred elementary schools in that city, and that the inhabitants of the city, their teachers, and their pupils and distinguished citizens, speaking of them as 'the people of Allah, their witnesses before God, and their trusty friends.' It is true that such statements of the Prophets in honour of teachers could, e., to be more favourably received. The same thing holds good of Islam in Sicily.4

4. Payment of teachers.—As has been indicated in the foregoing, the gravamen of the strictures urged against the teaching profession from the religious side was the fact that teachers asked and took payment for giving instruction in the Qur'an. The moral propriety of taking wages for religious instruction was a question frequently debated among Muslim jurists. It is to be presumed that in Islam, as in other religions, the devotee were in favour of gratuitous religious instruction. In spreading the knowledge of Divine things the teacher should have no other design (niyyah) than that of doing work well-pleasing to God, and thereby attaining nearness to Him. No financial consideration should attach to such work (qiyamah) than—on similar grounds—to the adhan,5 the salat, the diffusion of the hadith, etc. All such acts must be done only 'for God's sake,' not for the sake of gain.6 Here in fin de siécle, in evidence of its being the only legitimate one, there are numerous traditions to hand;7 nor were typical examples lacking to commend its acceptance. One such example was found in Abd al-Bakhr al-Sullami, a man of devout spirit, who had actually heard haditha from the lips of Othman and 'Ali, and who, at the time of his death (during the khilafah of 'Abd al-Malik), was invested of a mosque in

1 Quoted by 'Abdari, Madkadi, ii. 156.
2 Bn al-Jauzi pronounces the following verdict on this hadith: 'It is not permissible to use this saying as an argument [in the question of the propriety of teachers], for this is a hadith originating in Al-Qurtubi, Al-Salamani al-Jayyibi, who is a reliable and a learned people, and of the traditions of the Prophet, to which the people of the Maghrib are not enclined. In Suyuti's work on jurisprudential traditions likewise, this and other similar utterances of Lala write with a warning [Al-Lad's al-ma'ajas fi-l-ahladhi matbafa, p. 108 f.].
5 Bib. Geogr., ed. de Goeje, Leyden, 1870 ff., l. 57, top.
6 Cf. Maun, xi. 63, where the act of teaching theていたの体便に、iv. 129, where the act of teaching is decreed to be a sin hire, or learning the lesson of a paid teacher, is declared to be a sin
7 These traditions and testimonies are collected by the Hanbalite Ibn al-Jauzi (in Leyden University Library, no. 1772, fol. 1013).
Kufa, and in that capacity had devoted himself to teaching the Qur'an. It is recorded that once, on coming home, he found a little boy who declared that his father had sent him as a hujjat for instructing his son in the sacred volume. He asked him what he was going to do. He said, 'We take no remuneration for the Book of God.' Other teachers of the Qur'an gave similar practical expression to this point of view; and, in support of their contention that religious instruction should be gratuitous, mujāmas (gratuitously), appeal was made also to an admonition in the tradition: 'In fact, of point of fact, may be identified as a Talmudic maxim.  

But, while the demand for free religious teaching might be regarded enough as ideal, and while some steps have been taken to carry it into effect, it was naturally left behind in the march of practical life. It was, after all, necessary that the wretched beings who, without much moral support from their fellows, engaged in the work of teaching should at least make a bare subsistence out of it. In this, as in many other things, the religious injunction, with its ascetic ideal, could not be put in practice scrupulously to maintain a universal interdict against the merest pittance of payment.  

As a matter of fact, besides the more austere hadiths, there are others of a more humane character, and more favourable to the practice of taking wages for religious instruction; and the teacher who was not in a position to prosecute his calling for a purely spiritual reward could always derive comfort from this.

Even Bukhari himself finds a place in his Corpus Traditionum for a saying ascribed to Ibn Abbas: 'Nothing has a better right to be rewarded than instruction in the Book of God.' It is true that the same anecdote occurs, written down by Shahid, viz., that the teacher may on no account negotiate for his wages, but may accept what is voluntarily given him. Bukhari finally cites the testimony of Hakim b. 'Uyaina: 'I have never heard it said of any of the juyah that he disapproved of the teacher's remuneration. Even Hazan himself calls a teacher ten dirhama.' From Malik b. Anas comes the more decisive statement that in the days of Medina none has ever taken an humiliation at the teacher's receiving a reward even in this world—and that not merely as a voluntary honour from the parents, but as a fixed monthly fee (zakhrabba)  

Accordingly the payment of teachers became the rule actually recognized in practice by Muslim law, and was vindicated, with the support of the sources quoted above, by authorities of the highest reputation.

The adherents of the more rigid view, in giving their consent to the practice of paying teachers—this payment, however, they preferred to call 'salām' [reward, as distinguished from stipend] to place their feelings by qualifying the teacher's right by certain pia desideria, which, it is true, made very little difference. They appealed to the moral sense of the teacher. He must look upon his wages as a mere professional emolument, as a gift (fatta).  

Divinely bestowed upon him in order that he may pursue a calling well-pleasing to God.  

The all-important thing is the inward purpose (nayya); he must devote himself to the work from purely spiritual motives, and without any worldly considerations whatsoever. To this Abd al-Jabir adds the naive admonition that the teacher should make no public profession of his motives, as it is quite like the people of our time to take him at his word, and deprive him of his material recompense.  

Further, he must not let his continuance as a teacher be rigidly upon him. Should his allowance cease in any particular case, he must attend all the more zealously to the children of parents who, owing to their poverty, have fallen behind in their payments. From the children themselves he must not receive presents without the knowledge of their parents or guardians.  

In general, he must be satisfied that the money tendered him is above suspicion even then, and that it has not been gained dishonestly, or by methods obnoxious to religious precept; he should, for instance, have nothing to do with the money of a tax-gatherer. With respect to this counsel—it was, of course, simply a wish—it is interesting to note the qualifying clause annexed to it, viz., that in such cases the teacher need not refuse money from the hands of the mother or grandmother of his pupil, so long as an immediate source has the warrant of religious law.  

But he must avoid all intercourse with fathers whose occupation is at variance with the strict demands of religion; and, as long as they make their living thereby, he must not greet them, or hold himself accountable to them.

Stories of the exorbitant charges made by eminent teachers come down from every period, though it must be admitted that this applies only to those branches of learning which were not in the strict sense religious.

The grammarian Muhammad b. 'All al-Mubarazan (A.H. 424-448) pupil of Muharram, had a name for exasperating aviators. He would not give instruction in the kitab of Sibahah under a fee of one hundred dinars.  

Muhammad Shams al-din al-Suyuti (A.H. 409-485) says: 'Nothing is more necessary in the grammatical poem Afgyf; which comprises about a thousand lines.

5. School administration.—Muslim literature treatises in great detail of the teacher's demeanour towards his scholars, and the conditions applying to the conducting of schools. As regards the relation of teacher to pupil, the fundamental principle is the just and equal treatment of all scholars. Laith b. Mujahid affirms that at the Day of Judgment God will subject the schoolmaster to a special interrogation as to whether he maintained strict impartiality between pupil and pupil, and that, if he has found guilty in this respect, he will be set beside the workers of iniquity. A whole series of apparently trivial points relating to the child's presence in school are brought out by Avicenna. The principle that no distinction shall be made between children of the rich and children of the poor.  

Nor must the scholars be employed in the private service of the teacher's household, without the express sanction of their parents; and from this it is argued that the teacher must not make use of orphan children for such work under any circumstances.

It is the law in Islam that all teachers should be married; a similar requirement is found in the Talmud.  

A typical indication of the ethical standpoint of Eastern peoples is seen in the regulations designed to obviate the very suspicion of evil communications. The rule that the work of elemenary teaching must be done, not at the teacher's own

5 The hadith pro en com are brought together in the Abi-ward Mīsīr, Berlin Royal Library, no. 145.  
6 Bukhari, Yamaq, no. 16. That giving instruction in the Qur'ān might have a pecuniary equivalent is shown by a story in which a man who gave his hirelings money or money's worth as a wedding-present (makār) was allowed to take back several paras of the Qur'ān in lieu thereof (Bukhari, Nikāb, no. 40; cf. Zaraqūn in Macefāta, iii, 7).  
7 The present writer has not succeeded in tracing this regulation, as cited by Malik, in the Macefāta.  
9 Kamāl Pashahzādī wrote a special rúdāh fi ja'āza al-aš-šāh 'alā lā imār al-Qur'ān (Alawīār, Berlin MSS, no. 490).  
10 For this term, see ZCM xii, (1922) 60.  
11 'Abdārī, Makhtūl, ii, 118, line 13.  
12 Makhtūl, ii, 118, line 13.  
13 This is a special requirement found in the Talmud.  
14 A typical indication of the ethical standpoint of Eastern peoples is seen in the regulations designed to obviate the very suspicion of evil communications. The rule that the work of elementary teaching must be done, not at the teacher's own
residence, but in a specially appointed public place (bâвая, pl. bâваяt) within sight of the people was undertaken. It was also suggested to make his face visible. Nor could the halls of the mosques be used for this purpose, as little children might unwittingly defile the walls and flooring of the sacred edifice. This proposal was supported and saying of the Prophet: ‘Keep your boys and your liabilities away from your mosques’; but the precept was not strictly observed in practice. It has been a favourite custom for parents to conjoin the elementary school and the public fountain (gâlî); the institution of the latter is often combined with that of a school in the upper storey (maktab sobî). It is interesting to note Abûr’s criticism of certain practices common amongst teachers in his day. He holds it unworthy of the profession that a teacher, at the inauguration of his school—or afterwards, if he finds his undertaking insufficiently supported—should try to draw the attention and invite the patronage of the public by setting up placards before the school-gate. It is likewise unbecoming that a teacher, in requesting the parents to attend the school-festivals (âfrah), should in his letters of invitation (al-îd) flag it with high-born epithets and titles, or compose the invitations in verse.

The pupils must also have their off-days. The school must be closed for two days of every week, viz. Thursday and Friday, and also for a period of from one to three days before and after the âid festival. The Thursday holiday gave occasion to the proverbial phrase, ‘to be as happy as a teacher on Thursday’ (bâвая felâha al-‘amâdib bikhâmîn). The scholars are regarded as having enjoyed a whole or partial holiday whenever any one of them has finally mastered a section of the Qur’an. The parents of a boy who has succeeded in doing this celebrate the event by a festivity (fellûfî), and bestow upon the teacher a special gift, the acceptance of which is not frowned upon even by the precisians. When a youth completes his study of the Qur’an, the occasion is celebrated in a feast called (in Mecca) igâlâ, or (in the Maghrib) takhrîj. ‘Abdîr’s minute account of the more extravagant—and to him obnoxious—forms sometimes assumed by these functions reveals an interesting phase of contemporary life.

The question of corporal punishment was also discussed among those with whose educational methods we are now dealing. The ‘rod’ is regarded as the auxiliary of the teacher’s art. The ‘strap’—quite characteristically—becomes an object of comparison: ‘In the Prophet’s hand was a whip, like that used in school’ (ka-dirrat al-kutâb)—a simile often employed. The teacher is sometimes held up to derision by being described as ‘one who brandishes the whip’ (bâвая dirra) and takes reward for the book of God. Even the philosopher Ibn Sinâ, in his treatise on the education of children, speaks of the ‘assistance of the hand’ (al-isâ’i’ân li-yad) as a useful adjunct of instruction. The tutors of the young sons of khâlifs did not spare the rod, nor did the fathers disagree.

Abî-Muhammad describes a scene in which the Khalif ‘Abdallâh led by the hand Prince Marâwî, crying because of the whipping which had just been given him. Abî Maryam, preceptor to the imprisoned, exclaimed: ‘Oh! Brother, make this man black, as he was given to a

too drastic use of the teri. On one occasion he chastised Prince Amin severely as to make his face visible. The Prince complained to his father, and showed him the arm. The Khalif invited the aîrs pedagogy to dinner; and when the latter took no little apprehension, specified the offense for which the prince had been so sharply dealt with, the father accused him with the words: ‘You have not been sufficiently severe in killing him: it was better that he die than remain a fool.

A further form of punishment was ‘keeping in’; but, in the one instance of this known to us, it was the father, not the teacher, who administers the correction.

It was to be expected that, in order to protect the children against the undue severity of irascible masters, Muslim jurisprudence would endeavour to regulate the penalties applied, both as to their form and as to their degree. It sanctioned corporal punishment, especially for religious offenses, but only in the case of children over ten years of age; while, as to the amount of punishment, the extreme limit was variously laid down as between three and ten ‘light strokes.’ Nor must the teacher resort to any instrument used by the judge in administering legal penalties (hadd). The Mafdhâl speaks severely of contemporary teachers who chastise the children ‘with sticks’ and reprimands, Nubian switches, and even the instrument called the farâga (‘stocks’), and used for the bastinado. The supervision of the teacher in this, as in other matters, was assigned to the chief of police. In the directions drawn up for this office, he is instructed to be observant of the way in which children are treated at school, and to protect them from maltreatment by hot-tempered teachers.

6. Education of girls.—It must be borne in mind that the maxims relating to the training and instruction of the young apply only to boys (âbî). The education of girls did not fall under these rules except in one simple particular, as set forth in the police directions recorded by Ibn Bassâm, the female teachers of girls (mû’allimât al-banât) are to be more strictly looked after in regard to the poetical pieces which they set before their pupils. While it was deemed necessary to instruct girls in moral and religious things, there was no desire to lead them through the portals of intellectual development. Woman’s proper sphere centres in the spindle, and this requires no training in letters. Even the philosophic thinker and poet Abî-l’Ala al-Mâ’arrî († A.D. 1057) endorses this maxim, which became a veritable household proverb. This word was kept in the ancient and in the ancient and in the learned world.

The following utterance of the Prophet regarding females—said to rest on the authority of Āisha—is frequently quoted: ‘Do not let them frequent the roofs; do not teach them the art of writing; teach them spinning and the sârât al-mâr.’ But it were surely preposterous to regard this sûra

1 Mafdhâl al-wâledî, l. 50. 2 Alhâlî, tr. 111, line 6 from foot. 3 In the instructions regarding the training of children it is usually stated that ‘they shall receive corporal punishment for neglecting their prayers’ (e.g. Ghazali, as above); in other versions (e.g. Mafdhâl al-wâledî, l. 264) the terminus a quo is given as ten years.

The maxim of the third was deduced from the hadîth by certain Mâlikite theologians; see Qasîfînî, x. 49, l. 22 (on Bakhîtî, Mashârî, no. 29).

9 Kherem, Culturgeschichte, i. 153.

10 Mafdhâl, ii. 355. This sûra is reproduced in the Mustâra’d of Hâkim as an authentic saying of the Prophet.
Besides the women who attained eminence in various branches of science and literature, and especially in poetry, we find several who were active in civic service, as, e.g., 'Muzna (secretary to the Emir al-Nasir Il-din-Allah [A.H. 358 = A.D. 969]), the learned, gifted with a beautiful handwriting.' 

7. Education in ethical and political writings.—The problem of elementary education has not been ignored in the literature of ethics and politics. The somewhat mechanical precepts of the earlier theological writings have been furnished with a deeper foundation in ethics and philosophy, and enriched with the ideas of a more worthy conception of education than is generally, so also in education, we must recognize the powerful effects of that Hellenistic influence which we have already noted in some matters of detail. Reference was made above to an educational excremen which Avicenna incorporated in his tractate on government (risalat al-niyasa). But Avicenna dealt with little more than the formal elements of the subject; this writer, on the other hand, gives the art of writing that was withheld from women on principle. The daughter of Malik b. Ans was able to correct the errors of those who recited and transmitted her father's Maquina. That the rule against teaching women to write was a way of universal validity is disproved by the very name of a learned lady of Damascus, viz. Sitt al-kotaba ('mistress of the writers') bint abi-l-Farh, who supplied Jusuf b. 'Abdal-mumin of Nabilas with traditions. The learned woman is found even among remote tribes in the heart of the Southern Sahara, where women are apparently not prohibited from cultivating Muslim learning. 

8. The importance of this region of the Sahara poses books, precisely as do the seviers; nor do they abandon them even in the space of other migratory habits do not prevent them from devoting themselves to intellectual activities, or allowing their children, even girls, to share in such studies. 

Above all, however, it is the position of women in the educational life of Andalusian Islam, as portrayed by such writers as al-Marrakushi, and verified by the facts of literary history, that shows to what a small extent the prohibitory maxims were applied in actual religious practice.

Macdonald, The Moral Education of the Young 'Among the Muslims.', in \( \text{LJ.} \) xx. (1906) 286-304; cf. also al-Ghazzali, Letter on the education of the children, tr. by Muhammad ben Chenche, in Rev. \( \text{d} \) (1901) 201.

14. Lahvi (likewise a native of the Maghrib), Kitab Afal-ba'd, i. 76, line 6.

is Abu-l-Walid Ibn Rushd the elder († A.H. 520 = A.D. 1126), qadi of Cordova, and grandfather of the famous philosopher of the same name (i.e., Averroes). Abu Bakr Ibn al-'Arabi († A.H. 543 = A.D. 1148), qadi of Seville, and Haroun al-Rashid's (his ed.) educational ideas in a work entitled Marawi al-zulfa' ('Stages of approach', i.e. to God), is also frequently indebted—even in his language—to Gharazi's treatise. The Marawi is apparently lost, but many excerpts are quoted in a work by another Maghrabi writer, the Maadhah al-sharíf al-sharif ('Introduction to the Sublime Law') of Muhammad Ibn al-Hajj al-Abdari († A.H. 737 = A.D. 1334). This work, which has in view the reform of primary education in the land, is dedicated to the Sultan al-Mu'ayyadh.8

The second phase of the reform of primary education was inaugurated in 1845, under Sultan 'Abdul Majid, by the institution of the so-called Rushidiyyah schools, while in 1858 his successor, 'Abdul 'Aziz, established a lyceum in Galata-Serai.9 But, in spite of ceaseless efforts to raise the standard of education through out the Empire, the results still fall far short of a general diffusion of knowledge, and in many parts of the Ottoman Empire there has been no advance whatever upon the crude state of things in primitive times. It should be added, however, that in Turkey and elsewhere the more liberal-minded Muslims, in default of adequate institutions of their own, send their children to either Moslem or Christian schools established by European and American agencies. It will be readily understood that, in countries under European rule having a Muslim population, the various Governments have greatly promoted the cause of education by the establishment of a system of education which is based on the principle of training the native population for European political and social life.

7. Modern movements towards reform. — So long as the social life of Islam remained impervious to Western influence, and even to-day in circles that are still influenced by it, the instruction of the young proceeded mainly on the lines laid down in the older theological writings (see above, § 2). The best descriptions of this traditional stage are found in the works of E. Lane10 and P. Dor (London, 1835). The modern stage of educational rivalry between the various Muslim countries is a system of education which has been established in modern times. 

The activities of the Egyptian pasha, Muhammad 'Ali, the founder of modern Egypt, whose educational reforms, begun in 1811, were at first, it is true, of a somewhat circumscribed character. A further advance was made in 1824 by the erection of training schools in various departments, and the movement was partially organized and consolidated in 1836.11 On this basis all branches of education have made rapid progress in Egypt. In Turkey, the inauguration of primary education was delayed until 1845, under Sultan 'Abdul Majid, by the institution of the so-called Rushidiyyah schools, while in 1858 his successor, 'Abdul 'Aziz, established a lyceum in Galata-Serai. But, in spite of ceaseless efforts to raise the standard of education throughout Turkey, the results still fall far short of a general diffusion of knowledge, and in many parts of the Ottoman Empire there has been no advance whatever upon the crude state of things in primitive times. It should be added, however, that in Turkey and elsewhere the more liberal-minded Muslims, in default of adequate institutions of their own, send their children to either Moslem or Christian schools established by European and American agencies. It will be readily understood that, in countries under European rule having a Muslim population, the various Governments have greatly promoted the cause of education by the establishment of a system of education which is based on the principle of training the native population for European political and social life.

as a matter of vital moment for the Muhammadan world. The more important phases and incidents of the whole movement are described in the "Renaissance of the Sunna" of Al-madraia (Paris, since 1900), which deals with all Muslim countries, and has now completed its sixteenth volume.

Among specifically Muhammadan tendencies for educational reform, we may mention the Bābī movement, which arose in Persia in 1844 (see art. Bāb, Bābīs, vol. ii. p. 299 ff.), and which, as Bahā'ism, has since then been constantly extended. The principles of this sect have embraced an endeavour to raise primary education to a higher level and to relieve it of its long legacy of prejudice—aims which have been most strenuously pursued by the Bābīs. Their more exalted conception of woman and of her function in family life, and their abolition of the restraints placed upon the female sex by ancient convention, are naturally coupled with efforts to improve the education of girls.

With the progress of primary education the development of the higher grades of instruction goes hand in hand. In many parts of the Muslim world the law courts are rapidly developed, and the former. A considerable number of colleges for the study of special subjects—military, medical, legal, and technical—and designed primarily to make legal and political candidates, have been established, and in some centres these are combined to form a kind of university (dār al-funṣa). A large institution, designed to perform the function of a university, was quite recently erected in Cairo (President Karter, Prince Alī and Fud'ud Pasha, great grandson of Muhammad 'Alī). In Aligarh, India, the endeavour to form the academy founded there in 1875 into a university is within sight of success—a movement which, with Agha Khān at its head, finds generous support among adherents of Islam throughout India. Thehān likewise has a college which does its work under the style of a dār al-funṣa. By way of providing stepping-stones towards such higher institutions, effective progress is being made in Turkey and Egypt with the system of preparatory or 'adār schools.

These institutions are all conducted according to detailed instructions of the respective Governments, and the instructions are printed and made public. Various reforms, especially in regard to the system of examination and granting diplomas, have been introduced since the government has taken charge. In the great madrasa of the Azhār mosque in Cairo, in which the study of the various branches of theology is pursued on traditional lines; as also in the schools associated with that madrasa at Tańa (the Ahmediyā mosque), Damietta, and Alexandria. The need for reform in higher theological education has asserted itself also in more sequestered localities. Among other agencies aiming at the diffusion of culture among Muhammadans, mention may be made of the Khalidiyya institution at Tunis, which takes its name from the Ibn Khalīd referred to above. All these movements are but so many endeavors to raise the level of education in the Muslim world.

EDUCATION (Persian) — This has been given fully in the footnotes.

EDUCATION (Persian).—The Persians, like all other Orientals, attached high value to education, so that Hūrmazd (afterwards Hormuzd) IV. could reply to his teacher, the sage Buzurjmihr, that 'wisdom is the best thing, or the sage is the greatest among the great' (Shāh-nāma, tr. Mohi, Paris, 1876-78, vi. 425), and the Pahlavi Pandnāmāk-i Vajöry-Mitrō (ed. and tr. Peshotan Behrani Sanjana under the title Ganōshāyōgānī, Bombay, 1885, p. 11) makes the same sage say: 'Education makes man noble, . . . education is a corrector of man'; while the 9th cent. Dinkart (ed. and tr. Sanjana, Bombay, 1874 ff., p. 388) declares that 'men ought to raise themselves to illustrious positions by worldly knowledge and by education, (which enables them) to read and write.' So vital was this matter, especially as regards religion, that even an adult was advised by Buzurjmihr (Pandnāmāk, ed. tr. 21) to spend the night 'in getting religious training and in asking sensible questions of pious men,' the second third being devoted to agriculture, and the remainder to eating, sleeping, and recreation, and the cycle of the Avesta, in like manner, enjoins that the 'holy word' (mābra apenta) be pronounced to those who come 'seeking (religious) instruction' (zaturūnā [Vend. iv. 44]), and it is especially mentioned as a desirable characteristic of children that they be 'of good understanding' (Avira [Yasna, lixx. 5; Yast, xiii. 124].)

Thus far there is the unity of all generalities; but, when we turn to the data concerning the actual training of children, much confusion confronts us. The reason doubtless is that, just as in modern times, education was not absolutely uniform; and, in addition, the passages on which we must rely are largely concerned (especially in the classical authors) with the early training of royal children; while some accounts, notably those of Xenophon's Cyropaedia, are not free from the suspicion of exaggeration in the interests of political romance.

The Vehnidd states (xv. 45) that the care (trādēra) of the child should last seven years. Until the age of four (Bahārū Gūr, Shāh-nāma, v. 400), the infant passed his time in the women's apartments, and his first training was received from women and eunuchs (Plato, Legg. 695 A; cf. the pseudo-Platonic Aēlebardes Primus, 121 D). From five until seven the child should be under his father's tuition (Shāyast lā-Shāyast, v. I [West, SBE v. 290]), although, as in the case of Bahārū Gūr, who was sent to Arabia in infancy (Shāh-nāma, toe, etc.), this rule was not always observed. Real instruction began about the age of seven (Bahārū Gūr), or even as early as five (Herod. i. 136; Strabo, p. 733), and lasted until the age of twelve (Bahārū Gūr, who, however, seems to have been exceptionally brilliant), fifteen (Artaxiš Šāpāk, the founder of the Sassanian empire Kārnāmāk-i Artaxiš-i Pāpākān, ed. and tr. Dārā Peshotan Sanjana, Bombay, 1896, p. 367, and seventeen or seventeenth (Xenophon, Cyropaedia, I. II. 8), twenty (Herod. i. 190., or even twenty-four (Strabo, p. 733); but all essential instruction should be given by parents to their children by the age of fifteen (Pandnāmāk, p. 25). It was a man's duty to instruct his child, for thus it might rise to some superior station in life (Dink. ed. Sanjana, p. 263); and he should teach not only his child, but his wife, his countrymen, and himself
EDUCATION (Roman)

Persian children of noble and princely families were often educated at court (Xenoph. Anab. 1. ix. 3, Cyrop. VIII. vi. 10), although it was by no means unusual for high-born children to be sent for their training to private tutors. This was especially the case with Zames (Jām), the second son of Qubād (Procop. de Bell. Pers. i. 23), and with Bahram Gūr, the latter being educated in Arabia (Šahā-nāmah, v. 400). Tutors for the latter prince were sought from the civil and military classes of India, China, and Arabia, the choice being finally awarded to two sages from the country last-named (ib. p. 598 f.). Besides this, we are told by Clements (P. Alex. ii. 7) that the Persians had 'four royal pedagogues' (ცոքեստ «ra«, ṣa«), who, four in number, were chosen from all the Persians by the king and placed in charge of the instruction of his children. The pseudo-Piatoxos Asciabates Prinus (loc. cit.) adds that these men were appointed when the princes had reached the age of fourteen, and details their duties as follows:

The first, who was 'the most wise,' taught the 'magic' (σα«, τοιαύτα) of Persia, 'which is the source of the gods,' and royal duties; the second, who was 'the most just,' taught the child to practice truthfulness through acts and words; the third, who was 'the most prudent,' taught control of all passions and contempt of bodily pleasure; and the fourth, who was 'the most munificently,' taught the child to be fearless of all his masters, that is, the teachers of Bahram Gūr, though their branches of instruction, as noted above, were quite different from those detailed in the Greek sources.

Of the personal relations between teacher and pupil there is little record in the extant Iranian texts, although, from the respectful and affectionate attitude maintained towards the instructor in the Šahā-nāmah, it is to be inferred that the feeling between the two was one of tenderness and devotion. It has already been observed that a section of the lost ancient text Naak-devoted attention to 'the association of priestly instructor and pupil, and their meritoriousness together' (Dink. VIII. xxxvii. 4); and the Avesta, as now preserved, itself has a significant indication of the closeness of this relation (Vāst. x. 116 f.):

'Twentyfold is Meera (here the godliness of alliance and fidelity) between two friends from the same district; thirtyfold between two from the same community; fortystread between two from the same house; fiftyfold between two from the same room; sixtyfold between two from the same priestly gift; seventyfold between priestly pupil and priestly teacher (aṣārya aṣārya-pātra); eightyfold between son-in-law and father-in-law; ninetyfold between two sages; a hundredfold between a thousandfold between two countries; ten thousandfold is Meera to him who is of the Mazandaran religion.'

EDUCATION (Roman).—The history of Roman education is that of an evolution from the simple to the complex and comparatively encyclopedic kind of instruction; from what we should call 'primary' education through a stage when 'secondary' education was gradually combined with higher-learning of a 'University' stamp; from the ancient tribal history of the Samnite, and an imperial system of officials appointed under the cognizance of the Emperor; from an unpaid instruction by parent or slave to an organization where, at least in the upper classes, the study of the dialects, and from a narrowly Roman training to a cosmopolitan culture. To illustrate the development in these terms, there was an original Roman strain, there was subsequent crossing with Greek influences, and accompanied by vigorous adaptation as a new generation for the struggle and duties of life, and the equip-
ment which was sufficient for the burgher of a city-State needed wide expansion before it could suit the citizen or civil servant of a world-Empire. The altering aims and methods of Roman education are easily discernible in a chronological survey of the subjects which may be conveniently examined in three stages:

1. Earlier period—Republican times, to the age of the
   Punic Wars, c. 240 B.C.

2. Middle period—c. 240 B.C. to the reign of Hadrain, A.D. 195.

3. Final period—from A.D. 195 to the end of the Empire.

Cato's real contributions point out that amidst the ferment of the fresh ideas of Hellenic culture, Roman education was most progressive in the middle period, while in the later period the rhetorical training, on the contrary, became stereotyped; that is to say, education in the end ceased to secure so well the practical aims which it previously had in view, and the acceptance of traditional culture and methods as absolute rendered the system impervious to health-giving conceptions of change and advance.

1. Earlier period—to the Punic Wars.—For the earlier centuries of the city, evidence regarding education is scanty and untrustworthy.

Justin's account of the school attendance of Romulus and Romus at Gabii (Plut. Romal. vi), about Romus's Babies training, or about the education of Servius Tullus (Serv. Thes. Stg. 202), the teaching of Greek, given to Servian Tullus (Cit. de Rep. ii. xli). The advanced culture of Etruria, we know, influenced Roman religion and customs; but it is improbable of the having influenced Roman education (Cit. de Dic. i. xlii; Jullius, Les Professores de lett. etc., pp. 29-33), and, in fact, the state of general education in republican times, and the social fabric was not broad to foster education. It is true that Mounseon considers reading and writing to have been widely spread in Rome at an early period (Rom. Gram. i. 211f. [Eng. tr., 1875, 1, 224]); but even so one cannot positively assert the existence in the 5th cent. B.C. of schools at Rome from so scanty evidence year by year, although that would be the literal inference from Livy's account of Virgilia's school among the shops of the Forum (Livy, iii. xvi.; Dion. Hal. Ant. Rom. xi. xxvii.), nor can one on evidence similarly positive assert the existence of schools at Falerii and Tusculum in the times of Camillus (Livy, v. xxvi., vi. xxi.).

The character of education, however, during many generations of the older Republic can be readily grasped. The clearest conception of it is to be sought from what Plutarch tells us (Cot. Maj. xx.) of the way in which Cato brought up his son. Although this applies to the period of the Punic Wars, yet Cato's rigid attachment to traditional education, and his arrangement of the preparation of the next generation as a representative of the education after the ancestral fashion which preceded the Punic Wars. Cato kept a slave to teach the elements to the young people in his establishment; but he disliked the notion of having his own son scolded or reprimanded by an inferior; so he himself undertook the training of his boy in literature, law, and gymnastics (αθλος μη δι' γεγραμμενης, αθλος δι' αυστωσεως, αθλος δι' ομοστησεως). The physical education was in riding and the use of weapons, boxing, and exercises likely to test endurance. With his own hand and in large letters he wrote out historical narratives for the boy's use, and showed such fulsome regard for decency of behaviour and language in the interests of the youth's moral welfare that Plutarch expressly alludes to the noble work of moulding a young man to virtue.

This practical, physical, and moral training was long in vogue. The younger Pliny regretfully recalls those happy ages when instruction was more a matter of the eye than of the ear, and his concise formula expresses a central feature of the primitive training—"sans cuique parens pro magistro" (Ep. viii. xiv. 6), as does Seneque's allusion to the "domestic magistrates" (de Bon. iii. 11) as agents of education. He always had memory and prudence and so characterized the manners of times which encouraged youths to listen to a father's discussion of legal questions raised by his clientes in the atrium, to take part in his religious observances as camillus, to attend him to the senate (as was the usage at one period), to hear moments speech delivered, and even to accompany seniors to dinner-parties, where they might see "nonnullae laudes valorum" (Cic. Brut. xii. 75, Tusq. Disp. i. ii. 3; Val. Max. ii. i. 10; Varro ap. Non. 77, s.v. "Assa voce"), and where their presence might "sufficere mutuo timore" at least (Plut. Q. Rom. xxviii.), on the principle worthily formulated by Juvenal—"maxima debetur puero reverentia" (xiv. 47).

In the Latin sense educatio was applied to the process of training a child how to live—how to confront the problems of material existence (Varr. ap. Non. 447, 33, s.v. "Educere"; educat obstetrix, educat nutritix, institut paedagogus, doct magister"). In this sense, education began with the father's recognition of the newly-born infant's right to live, which was conceded if he formally raised it in his arms; and most of this early care for the young fell to the mother or to near kinwomen, or, in increasing degrees, was developed, to nurses. In the time of the Empire, Tacitus could still use the phrase 'in sinn matris educari'; and it should be remembered that a Roman matron was well equipped with the knowledge of physical, moral, and often intellectual training to sons and daughters. Her position was one of greater dignity than that of the Athenian wife, and some have ventured to think that 'the whole social fabric was reared by the forceful character of house-mothers in the serene atmosphere of the home' (C. W. L. Launspach, State and Family in Early Rome, 1908, p. 190). This is but a modern version of that 'rate/'educanda' to which we have alluded, which so alarmed Catu (Plut. Cat. Maj. viii.)

Although primitive usage preferred that mothers should suckle their own babies, there is good evidence for the early employment of both foster-mothers and dry nurses. At a later period the number of nurses employed can be gauged from the records of inscriptions (see 'Monumenta columbariorum,' in CIL vi. 4352, 4457, 4623, 5024, 5941-42; et, occurrences of matris and similar words in Indexes of the CIL ix. and x., under 'Parentehoe et accesoriorum'). Their importance was not restricted to questions of the proper feeding of infants, although this was not overlooked by the Romans (Varr. Cat. [for other readings Cato or Cappal, et de liberis educatis, cited Ant. Gall. vii. xiv.; Nonius, ii. 46, s.v. 'Ope'). It was recognized that they had much power in shaping the character of the future householder, and in securing the avoidance of many bad habits, foolish sed可疑, and objecting the youth to a representative for the stress laid upon the choice of a nurse in Quintilian and in the de Educatione Puerorum ascribed to Plutarch.

About the age of seven a Roman boy in the earlier period came more definitely under his father's tuition, to be taught on the lines which we have seen were followed by the elder Cato—namely, the elements of reading, writing, and reckoning, and such bodily exercises as would best fit him for military service. Boys belonging to the simpler and more agricultural times of Rome also took part in farm-work and in the rural religious ceremonial; while girls, learned, under their mother, spinning and other domestic accomplishments, except the menial tasks of corn-grinding and cookery. The two main careers were war and politics; and the object was to train a man of action, with no claims to rival the intellectual and aesthetic accomplishments of an accomplished, well-developed in body, reverential towards the gods, mindful of ancestral custom (mos maiorum), regardful of the laws which he learned as a boy by rote from the aediles and curatores, and inclining, therefore, by the force of precept and example to follow virtues like obedience, temperance, bravery, and industry, which may always be inculcated in a firm and well-organized system of education, if parents can be relied upon to perform their duty. There was nothing more

VOL. V.—14

EDUCATION (Roman) 209
distinctive of the native Roman education than its training, and the spirit set by morality—e.g. modesty (τα ἀπαχόρητα τῶν ῥητίων ώς ὑπνόου ἀλληλεπίδειον τοῖς πάθοις τῶν ῥητῶν παρόντος) & ἐν γτάξει καλῶς (Plut. Cat. Maj. xx.); cf. Cicero's terms of praise 'adulescens' (Mur. iii. 351 A); or obedientio (Dion. Hal. Ant. Rom. ii. 26). In fact, the outstanding qualities in a model young Roman may be taken, as summarized in Cicero's words, as 'self-control combined with aélunentia [literary] education in pristine beauty' (pro Cluent. lx. 165); or obedientio (Dion. Hal. Ant. Rom. ii. 26). Such were the moral results attained by an education entrusted without reserve to the familia, in consonance with a characteristic Roman regard for the patria potestas. By the time that a youth reached the age of 20, a training deemed adequate for all likely calls upon him had been given through the home, through exercise, through the companionship and experience of seniors, and through observation of the ways of men in the forum. The formal training of the neck, at least, was now taken over by the father himself, and attended, as claims on time became more insistent, to be delegated to a cultured slave, acting under the parental supervision.

While robust frames, disciplined minds, stolid gravity, yielding courage bore testimony to the strength of the ancient upbringing, it had its defects. It provided little to induce refinement, artistic tastes, or kindlier emotions. It produced a Cato, ready to recommend the prompt sale of a slave worn out by faithful service, or a Mummius, who sacked Corinth without compunction, and saw nothing extraordinary in laying down a stringent condition that his contractors for transporting uninvolved, had always had their hands on Rome should replace any lost or damaged en route! Yet, despite limitations, it was an admirable method of training patriotic warriors; and it yielded the constancy and energy requisite for the victors in the Punic Wars. Leaving such liberty to the family, and eschewing State infringement upon private instruction, the older Rome succeeded in drawing the bonds of citizenship closer than Greece had done through theories of systematized education.

2. Middle period—240 B.C.—A.D. 120.—The most momentous alien factor in the development of Roman education was the influence of Greece. Through the agency of Corinth, and the strong ties of kinship, was of high significance; but its details cannot be considered here (see 'The Invasion of Hellenism,' in J. W. Duff's Lit. Hist. of Rome, pp. 92–117). Some salient facts, however, must be noted. Relations between Rome and Magna Graecia led to contact with Greek civilization at an early but not exactly determinable date. The borrowing of the alphabet is a well-known instance; and coinmone and diplomacy obviously ensured acquaintance with Greek, at any rate in its spoken form. Thus Postumius in 282 B.C., as Roman envoy at Tarentum, could make a speech in the language, even if it was not yet a literary idiom. By the middle of the 2nd cent. B.C. at Rome is an acquaintance with the principles of Greek rhetoric on the part of the upper classes, and the emergence of three grades of education—the grammaticus, the rhetor, and the iunctura respectively. Roughly, they correspond to our elementary, secondary, and University standards (Apul. Flor. xx. 'prima cratarae litteratoris rudilatam simul scirem, grammatici doctrina instito, tertis rhetor eloquentiam acquiri'). The consideration of these must now occupy us.

(1) Elementary education.—The litteratus was in charge of the Crates, the most representative of Pyrrhus, seems to have addressed the Roman Senate in Greek without an interpreter. But this does not necessarily imply acquaintance with Greek literature, or presuppose a highly developed style, and certainly not until the middle of the 2nd cent. B.C. did the literatus (Orchilius, quoted in the Litteratus, Greg. iv.) acquire a high literary education. The considerable of the two individuals attributed to Cato. In private houses, failing the parent, a trained slave, or in some cases the child's own attendant (patella—gypsus), taught the rudiments; but elementary schools kept by a idiom magister (who was usually supplied the need of a literary text for Roman schools by translating the Odyssey into Latin saturnians. It remained in use till the days of Horace. The period of Livius was evidently one of educational activity; for he and Ennius, Sue- tonius says, were charged with the education of the same time teachers who gave instruction in both languages (de Gram. i. Another sign of the times was the opening, about 231 B.C., by Sp. Carvilius, of the first school where regular fees were charged. By 173 B.C. the teaching of Epicurean philosophy had excited so much attention that the Government, alarmed at its seductive plausibility, banished two of its professors. Soon after, Aemilius Paulus brought the royal library from Macedon to Rome (Plut. Aem. Paul. xxvii.; Isid. Orig. vi. v. 1), and the access of the 'Scipionic Circle' to its volumes must have influenced education, as it did literature. The residence of the thousand Achaean hostages in Italy for sixteen years after 167 B.C. is memorable, not only for the intellectual stimulus so given, but also for the recorded advice tendered by the most influential of the age, Polybius, to the younger Scipio—that he should take advantage of the educational facilities obtainable owing to the number of Greek teachers in Rome (Polyb. xxix. iii. x.).

The study by the same date of literature at Rome, and the renowned library of Perugene, came on an errand of state from King Attalus, and, being detained in Rome owing to a broken leg, spent some time in lecturing. A man of broad scholarship, he so improved the method of teaching by his lectures on Greek literature that Suetonius declares him to have been the introducer of 'grammar' (de Gram. i. ). Meanwhile Greek philosophy and rhetoric were making great headway—too much headway, as the many of many patriotic Romans; for in 161 the philosophi and rhetorches were banished, probably for reasons similar to those which in 92 B.C. prompted the censors Aemilianus and Crassus to interdict the rhetorches Latinis; namely, that, in handling rhetoric, they did not lecture in Greek and according to genuine Greek methods, but transferred their attention to Latin, and regarded students in a cheap school of impudence.' A similar distrust animated Cato's hostility to letting the dangerous brilliance of Carneades prolong his diplomatic visit and continue his discourses in the Aemilianus. In 115 B.C. the leading literary at Rome was high significance; but its details cannot been considered here (see 'The Invasion of Hellenism,' in J. W. Duff's Lit. Hist. of Rome, pp. 92–117). Some salient facts, however, must be noted. Relations between Rome and Magna Graecia led to contact with Greek civilization at an early but not exactly determinable date. The borrowing of the alphabet is a well-known instance; and coinmone and diplomacy obviously ensured acquaintance with Greek, at any rate in its spoken form. Thus Postumius in 282 B.C., as Roman envoy at Tarentum, could make a speech in the language, even if it was not yet a literary idiom. By the middle of the 2nd cent. B.C. at Rome is an acquaintance with the principles of Greek rhetoric on the part of the upper classes, and the emergence of three grades of education—the grammaticus, the rhetor, and the iunctura respectively. Roughly, they correspond to our elementary, secondary, and University standards (Apul. Flor. xx. 'prima cratarae litteratoris rudilatam simul scirem, grammatici doctrina instito, tertis rhetor eloquentiam acquiri'). The consideration of these must now occupy us.

(1) Elementary education.—The litteratus was in charge of the Crates, the most representative of Pyrrhus, seems to have addressed the Roman Senate in Greek without an interpreter. But this does not necessarily imply acquaintance with Greek literature, or presuppose a highly developed style, and certainly not until the middle of the 2nd cent. B.C. did the litteratus (Orchilius, quoted in the Litteratus, Greg. iv.) acquire a high literary education. The considerable of the two individuals attributed to Cato. In private houses, failing the parent, a trained slave, or in some cases the child's own attendant (patella—gypsus), taught the rudiments; but elementary schools kept by a idiom magister (who was usually
a freedman) were, despite the unconcern of the Government, on the increase. The percentage of illiteracy was less than might be supposed; for primary education must have been pretty widely diffused, to admit of the circulation of military orders in writing by the time of Polybius. The scribbling on the walls of Pompei, too, argue a wide-spread faculty of reading and writing in the 1st cent. A.D. The methods of elementary teaching were differentiated in Quintilian's work, the fullest educational Treatise which has come down from antiquity. The lack of literary texts has vanished long before his day, and he counsels early lessons on good authors (he prefers Greek [1. i. 121]), even before pupils can grasp the entire meaning. Simple fables and extracts from authors made convenient reading-books. The initial recognition of the shapes of letters can be, he points out, aided by ivory models given to children to play with (1. i. 20); for instruction in reading, see Grasberger, *Erziehung*, etc., ii. 250-500. Writing was started by guiding the pupil's hand, as he followed with the stitul characters traced on wax-covered tablets, or by a sort of stencil process in which the letters were cut out of wax or glass. (Enc. vi.) Later came the copying of specimen letters, and more advanced pupils would use a *columnus* with *atra mentum* to write upon vellum from Per- gramentum or papyrus. From the papyrus plant of the Nile (for instruction in writing, see Grasberger, *op. cit.* ii. 300 ff.). The *dictata magistri*, selections for dictation, gave practice in writing, and could be used for training the memory. In arithmetic many references show that the fingers were freely used for calculations. As at all times, tables had to be got up by rote, and St. Augustine recalls with an evident shudder of disgust the brain, bone, and one or two fingers, etc. (Conf. i. xiii. "unum et unum duo, duo et duo quattuor, odiosa cantio milii erat"). Harder sums were done with the help of the abacus and its *calculeti*, the board being marked out into columns for units, fives, tens, fifteens, hundreds, etc. The difficulties due to the awkwardness of the Roman figures were considerable (Marquardt, *Das Privatleben der Romer*, 67-104, or Fr. tr. *La Vie privée des Romains*, 1592, i. 113-125); but this fact did not prevent the attainment of high arithmetical skill by the capitalists, tax-farmers, money-lenders, and traders of a shrewd, hardheaded, and frequently even unscrupulous and dishonest manner, and diverted its attention from farming to money-getting. (2) Grammar School education.—Training under the grammaticus succeeded to elementary instruction commonly when the pupil was 12 or 13, and lasted until he passed at about 16 into the hands of the *rhetor*. It should be noted that age-limits for the different grades of study cannot be regarded as constant; for undoubtedly there was overlapping between the grades; thus, as now, pupils of the same age exhibited marked disparity in mental capacity; and the abandonment of the *bulla* of boyhood and the assumption of the *toga virilis* varied, with individuals and at different times, from 14 to 17, when military service usually began. At the Grammar School the aim was to teach intelligent and effective reading of standard authors in both Latin and Greek (cf. the series of *grammatici* mentioned by Suetonius, most were of Hel- lenic origin, and many were freedmen (de Gram. xv., xvi., xix., xx.)); but there were Romans who applied the methods of Crates' lectures on Greek literature at a later stage. (e.g. Neeius, Ennius, and Lucilius soon became school authors *op. cit. ii.*). On the whole, the profession received scant honour and scant pay. The magistrates' official duties involved the orator, the pantomime actor, and the boxer might act turn teacher (Suet. *op. cit. ix., xviii., xxi.); and yet there were instances of Roman knights taking up the work; and the educational demands must have been considerable when the city had over twenty flourishing Grammar Schools (op. cit. iii.). Under the Empire, good schools had a *grammaticus Latinitatis* and a *grammaticus Graecitatis*—a special teacher for each language, one lecturing in *toga*, the other in *pallium*. Though their subject-matter was different, the method was the same for both (Quint. i. iv. 1). This specialization and style of description are abundantly clear from inscriptions found in Italy and the provinces (e.g. the Graecus in CIL VI. 12036 (Corduba); the Latinitatis, ii. 2592 (Triclia in Spain); iii. 460 [Thys- tines in Asia Minor, *PhMIRG*], 3433 (Verona), 3273 (Como), vi. 926 [Rome], ix. 3424). Greek *grammatici*, who taught in Rome towards the end of the Republic, understood and wrote Latin also. The freedman Atelius Philologus, a native of Athens, was described by Asininius Pollio as 'nobilis grammaticus Latinus' (Suet. *de Gram. x.), and Ghipho, Cicero's teacher, was 'non minus Graece quam Latine doctus' (op. cit. vii.). Professors who took the simple title of *grammaticus* were usually *grammatici* (cf. 3572, [magistro artis grammaticae]), vi. 9444-9452, ix. 1654). 'Grammar' (grammation) covered a wider field than in our accent.—Its two main terms were 'recti loquendi scientia' and 'poeconom enaratio,' in other words, the knowledge of the correct employment of language and the appreciation of literature (Quint. i. iv. 14). The first division consisted of the study of the parts of speech, accents, metric, and discussed faults in use of words, in idiom, pronunciation, spelling. The second division, which aimed at elucidation of the poets, involved far more than mere learning of the geographical, historical, or mythological implications of the matter, subsidiary subjects, like music, geometry, astronomy, and philosophy, were necessary for successful teaching or study (Quint. i. iv. 4, i. x.). Prose was much less lectured upon than verse; so that Cicero with reason complains of the comparative neglect of history (de Leg. i. ii.). For linguistic study, pupils used the Latin grammar of Memmius Philonem, or the Greek handbook by Dionysius of Thrace, a work which had its ground at Constantinople till the 13th cent. A.D. Inquiry into the phenomena of language appealed to geniuses; if we read Crates' and Philostratus'city, to savants like Varro, to statesmen like Cesar, and to some of the Emperors; while the Corpus of the grammarians (ed. Keil), taken along with such representative commentaries as upon Virgil as Macrobius and Servius, will suffice to indicate the range and methods of Roman grammar. The tasks set included the re-telling of *Aesop's* fables as an oral and a written exercise, paraphrasing, training in *sententias* (moral maxims), *chriseis* (anecdotes with moral bearing), *ethologicae* (personal character-descriptions), *narrativae* (short stories on poetic themes, to teach matter rather than style (Quint. i. ix. 4). The study of literature—the coping-stone of ancient grammar—involved *lectio* (expressive reading without singing or provincial accent (Quint. i. vii. 2, viii. 5, xi. iii. 30)); *enarratio* (erudite explanation of the subject-matter); *mentio* (partial criticism); *judicium* (literary criticism). The authors prescribed by the *grammatici* were largely identical with those prescribed by the *rhetor* at a later stage. This was handled by Quintilicus in his tenth book; only, the standpoint of study ultimately altered to oratorical effectiveness. In Greek the rule was to begin with Homer, as in Latin with Virgil. Homer was approved as an indispensable text for the study of language, history,
myth, religion, manners, geography; and wide knowledge—with sometimes the same details—was demanded from a lecturer. Other Greek authors popular in schools were Hesiod, for his practical maxims; the lyric poets in selections, excluding or minimizing the erotic; the greater tragedians, and the comic poets, especially Menander. Among Latin texts which had a prolonged vogue were Andronieus' verse translation of the Odyssey, the older epic poets Naevius and Quintus Ennius, Plautus, Terence, Pacuvius, Accins, Afranius. Virgil was introduced into the school course by Caecilius Epictetus, a freedman of Atticus, not long after the poet's death, and took among Roman authors a place parallel with Homer's among the Greeks. Horace, too, was soon found in the schools; and a desire to escape from archaic models accounts for the lectures which were given on the poems of Laecan, Statius, and Nero himself, during the lifetime of the authors. The literary reaction of the 2nd cent. A.D. led to a revival of interest in ante-Augustan poets. This predominance of poetic study, which is so marked a feature of the course in Latin was not to be found in Greek. But prose authors received more attention from the rhetor. Cicero became a model in his own day, and Quintilian holds him up as 'incomparabili incipientior, quietusque, auctoribus.' Among the grammarians he recommends Livy in preference to Sallust, who, he maintains, needs a more advanced intelligence; but here Quintilian is thinking more especially of the training for declamation.

The highest education.—In the final stage of formal education, namely, under the rhetor, the training was designed to fit directly for the duties of public life—for deliberative and forensic oratory, and, its faults notwithstanding, rhetoric turned out, in the time of the Empire, men of affairs, magistrates, civil servants, and advocates, equipped with an admirable power of effective speech. The Roman turn for oratory ensured an early and favourable attention to the practice and theory of Greek rhetoric, which inherited old traditions from Sicily, Athens, and Asia Minor. The Greek rhetor was, therefore, heard gladly, and his lessons were acceptable to an extent not always conceded to rhetores Latini, who had been viewed with suspicion by the authorities in 92 B.C., and who did not in Quintilian's time do their work so well as their Greek colleagues (I. ix. 6). But the relation between formal grammar and rhetoric, Quintilian touches on the constantly recurrent phenomenon of overlapping in education (II. i.). In this case it was nothing new, for Suetonius tells us that in ancient times the same teacher often taught both departments (de Gram. iv. 'neteres grammatici et rhetorici docebant'); and Quintilian says that boys were often kept too long by the grammarians before being sent on to the rhetor. With his usual good sense he recognizes that the time for passing into the rhetor's hands should depend on capacity rather than on years (II. i. 7). The secondary teachers, however, were often required to teach French on the superior provinces, and to give boys practice in what were really rhetorical exercises, so that pupils might go on to the professor of rhetoric creditably equipped (Suet. de Gram. iv. 'ne neciscit sese omnino ardid, publice reddere possit').

By the middle of the 2nd cent. B.C., as has been seen, the principles of Greek rhetoric were familiar to the upper classes at Rome; but a new departure was the introduction of 'declarations' on imaginary themes—perhaps by Molon of Rhodes about 84 B.C., as Borneoq thinks (Les Déclarations et les déclamateurs, p. 42). This hypothesis is not at variance with the probable date of the earliest systematic treatise in Latin upon rhetoric, ad Arearinum (c. 42 B.C.), or at the latest it touched on declamation, and furnished subjects for debate of the suasaoria type. It was only, however, towards the end of Cicero's life that declamatio came to be transferred from its old sense of vehemence of delivery to the sense of an oratorical exercise upon an invented subject. Declamation subsequently became the crowning exercise in rhetoric, and spread from Rome through Italy to the provinces, and from there to the schools.

To lead up to declamation the rhetorician prescribed a definite series of preliminary exercises, and for effective educational results Quintilian insists that the professor must be of excellent character, as well as of the highest possible intellectual ability, and tact in dealing with a class (II. ii.-iii.). The preliminary exercises (II. iv.) include composing narratives of a less poetic stamp than in the 'Grammar School,' discussion of matters of historic doubt, panegyric and invective, comparison of characters, communtes loci (traits of character useful for attacking vices), theses (questions of a general type for deliberation, e.g. 'Is it to be thought right to kill one's brother?'), coniecturales causae, which Quintilian remembered as a pleasant exercise of his own student days (e.g. 'Why is the sky blue?'). Among these the rhetorician recommends Livy in preference to Sallust, who, he maintains, needs a more advanced intelligence; but here Quintilian is thinking more especially of the training for declamation.

The highest education.—In the final stage of formal education, namely, under the rhetor, the training was designed to fit directly for the duties of public life—for deliberative and forensic oratory, and, its faults notwithstanding, rhetoric turned out, in the time of the Empire, men of affairs, magistrates, civil servants, and advocates, equipped with an admirable power of effective speech. The Roman turn for oratory ensured an early and favourable attention to the practice and theory of Greek rhetoric, which inherited old traditions from Sicily, Athens, and Asia Minor. The Greek rhetor was, therefore, heard gladly, and his lessons were acceptable to an extent not always conceded to rhetores Latini, who had been viewed with suspicion by the authorities in 92 B.C., and who did not in Quintilian's time do their work so well as their Greek colleagues (I. ix. 6). But the relation between formal grammar and rhetoric, Quintilian touches on the constantly recurrent phenomenon of overlapping in education (II. i.). In this case it was nothing new, for Suetonius tells us that in ancient times the same teacher often taught both departments (de Gram. iv. 'neteres grammatici et rhetorici docebant'); and Quintilian says that boys were often kept too long by the grammarians before being sent on to the rhetor. With his usual good sense he recognizes that the time for passing into the rhetor's hands should depend on capacity rather than on years (II. i. 7). The secondary teachers, however, were often required to teach French on the superior provinces, and to give boys practice in what were really rhetorical exercises, so that pupils might go on to the professor of rhetoric creditably equipped (Suet. de Gram. iv. 'ne neciscit sese omnino ardid, publice reddere possit').

By the middle of the 2nd cent. B.C., as has been seen, the principles of Greek rhetoric were familiar to the upper classes at Rome; but a new departure was the introduction of 'declarations' on imaginary themes—perhaps by Molon of Rhodes about 84 B.C., as Borneoq thinks (Les Déclarations et les déclamateurs, p. 42). This hypothesis is not at variance with the probable date of the earliest
match for his son, and orders him to divorce the pirate-chief's daughter. The son refuses, and is disinherited (Sen. Cato, i. vi.).

This kind of exercise sharpened the wits by a sort of mental gymnastic; it produced marvellous subtility of argument, and great readiness and finish of speech, but hazardous drawbacks. Its range was narrow and artificial; its subjects were hackneyed—so that the dreary round of declamation on the same subject by youth after youth rising in the schools, as Juvenal remarks, enough to kill teachers with boredom ('Occidit miseris crambe repetita magistros' [vii. 151]). Old material had to be dressed in apparently fresh form; and this caused an excessive concentration upon style and expression, to the inevitable detriment of subject-matter and sound sense. The system was calculated to produce an indifference to truth, to the rights or wrongs of a case, and so was morally deleterious; it fostered, too, that glinse of speech which seemed so detestable to the sensible author of the de Educandone Puerorum; and—most notorious and most wide-reaching—the effect, accounted for a large amount of the tinsel, staginess, and artificiality of the Roman literature of the Silver Age.

It was a complaint with good judges, like Quintilian and Tacitus, that the licence and immorality concealed in the fault, the tendency to over eloquence. Like Cicero before him, Quintilian contemplated an ideal oratory on a basis morally and intellectually sound (Quint. xii. 1, 1), and he cites Cicero's requirement of wide knowledge as an indispensable equipment ('omnia rerum magnarum atque artium scientiam' [ii. xxi. 14]). Quintilian's requirements are stated more modestly when he says that the orator must at least study the subject on which he is to speak—'sed mildly satis est eius esse oratorem rei de qua dicet non insigne.' But he does desiderate acquaintance with many subjects outside the professional training—e.g. ethics, physics, and dialectic (t. prooem. 16; xii. 10, 10), law (xii. iii.), and history (xii. iv.). It was, indeed, largely in philosophy that Roman students of ability followed their 'post-graduate' course, either in the capital itself, where Epicurean, Academic, and Stoic thought had long been represented, or in Athens as the traditional headquarters of the schools. The education of great authors must not be taken as absolute, however; if they professed an educational prejudice, it was to study for mental training as well as intellectual (ad Hel. xvii., ad Marc. xvi.); and Quintilian favours the intellectual development of women for the sake of their children (i. 6; for ancient frescoes from Herculaneum showing women studying mathematics, see references in art. 'Education,' in Daremberg-Saglio). The mark made by women in authorship testifies to emancipation from, or expansion of, the ancient ideal of an academic teaching in Rome; but at the age of 27, partly for health, partly for culture, he went abroad and studied under eminent Greeks in Athens, Asia Minor, and Rhodes. Cesar was 25 when he visited Rhodes, mainly for advanced rhetoric. The age for study at a foreign 'University,' however, was usually earlier. The younger Cicero and Ovid were 20 when they went to Athens; Horace was studying philosophy there at 18.

Encyclopedic learning became obviously less attainable as knowledge advanced, and distinct progress in education between the 2nd cent. B.C. and the close of the Republic is evident on a comparison of Cato's list of subjects of general culture and Varro's list in his Disciplinarum libri ix. In the Roman gentleman's education, Cato included grammar, agriculture, law, war, and medicine; while Varro added logic, dialectic, rhetoric, geometry, arithmetica, astronomy, music, medicine, and architecture. The significant point is that war, law, and agriculture had disappeared from Cato, and were coupled with the quadrivium, or advanced course pursued from the time of Martianus Capella.

The practical outlook of the Roman developed an education different in conception from that of the Middle Ages, and the four principal subjects, with the quadrivium, or advanced course pursued from the time of Martianus Capella.

The practical outlook of the Roman developed an education different in conception from that of the Middle Ages, and the four principal subjects, with the quadrivium, or advanced course pursued from the time of Martianus Capella.
street by a curtain, or in a room above, open on one side, but with a veranda or Italian loggia (pergola). Thus, if there was no inspective faculty, there was publicity; and the noise of school lessons, which began at an early hour, was a subject of complaint in Rome (Ovid, Amores, i, vii, 13-14; Mart. ix, vii, 1-3). There was, however, the education of the use of models, maps, and busts. The tabula Iliaca, in the Capitoline Museum at Rome, was a sort of concrete aid to study for a class working upon Homer; it may have been used by Augustan boys when a boy. We hear surprisingly little of the buildings used in higher work: halls, porticoes, theatres, baths, and wrestling-schools could be used for largely attended declamations. We read, too, of 'roomy exedrae furnished with seats, wherein philosophers, rhetoricians, and the rest of the study-loving world may sit and debate' (Vitruv. v, xi, 'exedrae spatiosae in quibus philosophi rhetorices recipiantque qui studiis deflectantur sedentes disputarent possint'). Hadrian's Athenaeum was a noble edifice, in the amphitheatres of which Greek and Latin rhetors could lecture to crowded audiences (Aurel. Victor, de Caesar. ep., i, 5; Alex. Sev. xxxv, xxxvi, Capit. Perit., xi, Gord. Trex, iii.). As to fees, the eight assess per month of the country school mentioned by Horace (Sat. i, vi, 75) show that education in the age was not haphazardly paid. Masters seem in early days to have depended chiefly on freewill offerings from pupils or their parents at times of festivals like the Quinquatrus in March (when the Mineralis was presented to the teacher), or the Saturnalia in December. Carvilius, towards the end of the 3rd cent. B.C., seems to have introduced the innovation of regularly charging school fees; but probably many adhered to the old custom of trusting to the goodwill and generosity of patrons. Thus Gnipho, Ciceror's master, never stipulated for a fee (Suet. de Gram. vii, 1). Senecanus records the extreme poverty of some famous grammarians; e.g. Orbilius, Valerius Catala, and Hyginus the freedman of Augustus and librarian of the Palatine (Suet. de Gram. ix, xi, xx.). On the other hand, some were fortunate enough to secure favour in high places; thus, Vitruvius Plancus was nominated by Augustus as a preceptor to his grandsons, had his school housed in the Palatium under the condition that he would accept no new pupils, and received a salary of 10,000 sesterces (op. cit., xvii). Remmius Palaemon made 400,000 sesterces annually from his school (op. cit. xxiii). In Imperial times, especially in the later period still to be considered, with the emergence of municipal schools there appears the feature of less endowment of education; and, where the municipality did not act, it was possible for a few private individuals to guarantee the salary of a master, as the younger Pliny suggested when he found that boys had to be sent from Como to Milan for their education. The first Emperor to appoint State-paid professors of rhetoric was Vespasian (Suet. Vesp. xviii); and thenceforward, in the higher teaching of rhetoric or philosophy, especially if directly encouraged by Imperial favour, men like Quinian could count on making a good income.

6) Punishments and holidays.-The Roman schoolmaster was a severe disciplinarian, and unsatisfactory pupils were ‘flogged’ (ferula [Juv. i, 15]) or with the severer scutica. A famous fresco from Herculanenum represents a pupil ‘bored’ by another, while a third holds his feet and makes him ‘play’. Quintilian expresses his objection to corporal punishment (4, ii, 14). As to holidays, climatic conditions must have necessitated a considerable break in the hottest time of the year; and during harvest and vintage there can have been little or no attendance at country schools. The old calendar had a four months' summer holiday, based on a false reading in Horace (Sat. i, vi, 75), is an error, but one which appears to have been held (esp. in A.D. 362-367) during the celebration of the edification of the church at Thessalonica. The 3rd cent. and the greater public festivals brought a cessation of school-work. Apart from minor feasts and extraordinary occasions for rejoicing and giving, there were the regular holidays, festivals alone accounted for over sixty holidays every year.

3. From Hadrian to the end of the Roman Empire.—The State, which had concerned itself with morality by repeatedly enacted summary laws and by encouraging marriage, was much slower to take education under its direct cognizance. Yet it is the Imperial concern for education which makes the distinctive feature of this closing period; for neither in East nor in West did the substance or method of education alter much. Thus, in the Greek portions of the Roman world the 'Second Sophistic' was represented by travelling rhetoricians, who found critical audiences—indicative of a wide diffusion of the old intellectual culture (Dill, Rom. Soc. from Nero to Marcus Aurelius, 1905, p. 575; Mommsen, Provinces of Rom. Empire, 1865, etc. cf. Philostr. Apoll. Tyan. i, 7, Vit. Soph. i, 220). Again, in the West, Africa (especially at Carthage), Spain, and the Gallic seats of learning maintained the ancient training in grammar and rhetoric. Marseilles, Autun, Lyons, Bordeaux, and, later, Toulouse, Narbonne, and Trèves were representative centres. It was the continuance of an old movement. Agricola had in early life realized the benefits of a good education in a country and about A.D. 80 established schools in Britain for chieftains' sons. In the 2nd cent. Juvenile glances at the craze for culture signified by the influence of Gallic eloquence on British lawyers, and by the talk in the 'Farthest North' about appointing a professor of rhetoric (Sat. xv. 111-112). Marcus Aurelius went through the normal three stages with certain conditions; lessons from his 'litterator' were amplified by others from naming an actor and a tutor who was both musician and geometer; at the next stage he had one Greek and three Latin grammatici; at the third stage he had three Greek masters of eloquence (including a Greek philosopher and one Latin master, Pronto. He studied under many philosophers, and worked hard at law. He also attended public declamations (Capitol. M. Ant. Phil. ii, 3). A broadly similar course, though less full, was followed early in the 3rd cent. by Alexander Severus, first in the East, and afterwards at Rome (Lamprid. Alex. Sev. iii). The persistence of the ancient pagan learning meets us in an interesting way when we note the course of training followed by Christian Fathers and well represented in the Confessios of St. Augustine, which, at the utterance of one who had been a student in Africa and a professor at Milan, place vividly before us at once the aesthetic attractions and the moral defects of classical literature.

The characteristics of Roman education in Gaul during the 4th and 5th cents. are best known to us through the works of Ausonius and Augustine. Ausonius' (Dill, Rom. Soc. in last Cent. of W. Empire, pp. 385-451). The rhetorical training had suffered inevitable degeneration, thanks to its extravagancies and to the roving habit of handling unrealities; but one pleasant feature in the literary education is its tendency to form a ground of common interest between Christian and non-Christian friends. Another and a less pleasant feature, suggested in the coming down of the Empire, and anticipative of the training of the Middle Ages, is the gradual decline of the study of Greek in the West. This is quite noticeable.
both in Gaul and in Africa, where, in the time of Apuleius and Tertullian, educated men had known Greek as proficiently as Latin. St. Augustine, for example, had little hold upon or affection for Greek, and studied Plato chiefly in Latin translation.

The attitude of the central authorities towards education, which is the salient feature of this period, had been foreshadowed from the very beginning of the Empire. Julius Caesar granted the franchise to medical men and teachers of the liberal arts (Suet. Div. Jul. xlii.)—a great testimony to the dignity of learning as a passport for foreigners to Roman citizenship. A similar spirit prompted Augustus' exemption of teachers from a decree banning foreigners (Suet. Div. Aug. xliii.); and his establishment of Verrius Flaccus in the Palatium has been mentioned. Tiberius and Claudius were interested in schools and in grammatical learning; but the next practical step in the direction of Imperial patronage was Vespasian's fixing of an annual stipend of 100,000 sesterces for Greek and Latin rhetors (Suet. Vesp. xviii.). This stipend of about £80 a year probably would not hold good outside the capital itself, and it may not have been till the reign of Domitian that Vespasian's arrangements came into actual execution. Some entries under Domitian's reign (Eus. Chron. ad ann. 2194) is:

'Quintilius Calagurritanus ex Hispania primus Romanae publicae scholarum et salarium e fisico acceperat et curavit.' Trajan's decision to confer education upon 5000 poor boys was a recognition of the gain to the community from having its future citizens trained (Plin. Paneg. xxvi.-xxviii.). Then, under Hadrian, came that expansion of educational policy from Rome to the Empire on a large scale which marks his reign as the opening of a new era. Himself a widely read student, accomplished in painting and music, with a taste for declaiming, and fond of having learned men in his entourage, he showed liberality to all professors, and he superannuated teachers who were beyond their work (Spart. Hadr. xvi.). Besides giving rhetoric a home at his Athenaeum in the capital, he established schools in the provinces, granted them subventions, and appointed teachers.

Hadrian's policy was continued and extended by Antoninus Pius (Capitol. Ant. Pias. xii.: 'rhetori et grammatici subventiones et salaria delibuit'), who also exempted rhetors, philosophers, grammarians, and doctors from certain State imposts, laying down the number of professors to be thus exempted (see Leg. xxiii.); in the smallest, within the scope of the decree, 5 doctors, 3 sophists, 3 grammarians (Digest. xxvii. 1, 6). This measure proves the relationship of municipal and central authorities with the personnel of the teaching body. In reality, the expense of such schools fell on the municipalities, and the Emperors by special benefits simply encouraged and supported the towns in their educational labours. It was in this very year that a single person made application to an 'organisation municipale de l'enseignement' (art. 'Éducation,' in Darmeneng-Saglio; cf. Boissier, 'L'instruction publique,' loc. cit. infra, pp. 331-335).

In A.D. 176, Marcus Aurelius made payments to establish professorships at Athens (Dio Cass. xxi. 31. 3; ed. Bekker; Lucian, Eun. iii.). In the 3rd cent. with Alexander Severus appeared a curious system; for, while imperial funds and stipendiary salaries for rhetors, grammarians, and others, he arranged that their lectures should be attended by poor students aided by exhibitions (Lamprid. Alex. xii. and xii., 3). In this way, the urban philosophical schools, madefilos, mode ingenios, dari insitus'). The recurrence of enactments in the 4th cent. proves the tendency of municipalities to be mean or dilatory in paying salaries to teachers, education always appearing to offer a tempting field for economy. In 301, monthly payments were fixed by edict of Diocletian; e.g. 30 denarii per pupil for a magister institutor, 15 for a catechumen, 5 for a grammarian, and 3 for a geometra. Constantine ordained the regular payment of salaries, and by edicts of A.D. 321, 326, and 353 he granted indulgences to tax-exempted libraries studiis multos instituant.' When Constantius Chlorus appointed Eunapius to be principal of the resuscitated school at Antion about A.D. 297, the town had accepted the Emperor's right to choose as quite natural; and in 382, Julian claimed the nomination of professors throughout the Empire as a prerogative of the Emperor, but delegated the sitting of candidates to the local bodies (Cod. Theod. xiii. 3, 5). His forbidding of Christians to teach in schools was the first definite restriction imposed by the Emperor upon the freedom of local choice. Different rescripts of Gratian and of Theodosius regulate the number and number of professors (Cod. xiii. 11, xiv. 0. 3). Gratian's policy possesses a special interest, because it was probably guided by his adviser and former tutor, Austrinus; his edict left the appointments of teachers to the local communities, or the provinces; e.g. a rhetor was to have twice the amount due to a grammarian. Now, this was equivalent to ear-marking money in the municipal budgets for professional salaries.

The last notable advance in the Imperial organization of public instruction is the foundation by Theodosius ii. at Constantinople in 425 (little over a century before its dissolution by Justinian) of a University staffed by 21 professors, viz. 3 Latin rhetors, 10 Latin grammarians, 5 Greek rhetors, 10 Greek grammarians, 1 philosopher, 2 jurisconsults. The professors were treated as State-functionaries, and a monopoly in public teaching was secured to the University. The staffing is significant for its omissions. Neither science nor medicine figures in the list, and philosophy is poorly represented; yet Constantinople had a wider curriculum than most other institutions, which in the main concentrated their work, as Bordeaux did, upon grammar and rhetoric. Thus philosophy, never truly a passion with the Romans, and certainly not with Constantine and his successors, had a currency of the 4th cent., came to be fully represented only at Athens, which in this respect outshone Massilia, Naples, Alexandria, Antioch, Seleucia, Smyrna, Ephesus, Ithaca, and a dozen other towns. A.D. 417 a law of Valentinian iii. (A.D. 370) illustrates the concern of the Government for another aspect of education. It lays down rules for the supervision of students at Rome. On arrival, they were required to deliver to the magister instititor a passport from the governor of their own province, stating their antecedents; they must declare their intended course of study; misconduct might render them liable to public punishment; and permission to reside in Rome up to the age of 29 was made conditional on good behaviour and diligent study. Such regulations were necessary; for idlers and rogues, like the authors of St. Augustine's Confessions, could and did misuse themselves to terror professors and to fellow-pupils in the
schools of Europe, Africa, and Asia Minor. The amenities and the troubles of student life in the 4th cent., both in West and in East, are brought home to us in the pages of Ambrose, Augustine, Eusebius, and Gratian. We read of a cultured society looking back with pleasure and gratitude to ‘college’ lectures and companionships; students flocking to the lectures of a famous professor, especially if it be an Eunapius, and seeing themselves as one among its own kind. The profession required of a student, or under the impression of rebuking them, or jealousy over a rival’s reputation; corporations of students formed, as Eunapius discovered, to further the interests of a favourite professor, to waylay new-comers, and by rough ordeals initiate them into membership, under oath that they would take no lessons except from sophists recognized by their worshipful association (see A. Müller, loc. cit. infra).

If we take Gaul as typical of the survival of the old Roman education, we find in the 5th cent. that studies have ceased to make any advance, and that the classical tradition is on the eve of disappearance before irruptions of barbarism and the distrustful attitude of the Christian monastic schools.

EDUCATION, MORAL.—I. Definition and scope. The concept ‘moral education’ requires to be clearly defined; otherwise much confusion is bound to arise in discussion. We shall consider first what the definition should include, then what it should exclude.

(a) Religious and denominational duties.—The differences between the members of the human race are altogether insignificant compared with the differences between a man and his Deity. We may, therefore, profitably distinguish, at least for practical purposes, that part of religious duties which have to do with the religious convictions or activities of a man’s relation to his Deity or not that to his fellows is a purely ethical one; therefore, just as we do not look upon every human question as an ethical one, so we must bear in mind that every religious problem is not necessarily a moral one. We are thus justified in distinguishing between theological and moral duties, and in confining, for all intents and purposes, theological duties to the religious lesson, and moral duties to the home. Both religious and moral education would be gained by such a separation, since the duties towards our fellows and those towards the Deity, which differ in several respects, could be more exhaustively and more fruitfully treated. This would be all the more important because opinions on theology vary so widely in the 20th century.

The objections to the theological side of education, on the one hand, are still the point of view, for a similar connection exists between theology and moral subjects. For instance, we are taught that it is a religious duty to be ‘mindful of the welfare of others,’ and that it is a moral duty to look after our own. There is a compelling reason why morality, any more than history or science, should be treated at all in the home. To the extent that the object is justifiable, it may be met by occasional references to the religious lesson to ethics, history, and science, and that the case may be, and, in denominational schools, by occasional references to theology when treating of the same subject. This problem is of course a special one for the Portuguese Mission Instruction Manual for Primary Schools is devoted to theological duties, including duties to the Church, while, conversely, the Portuguese Catechism treats to some extent of moral duties. Each, morality and theology, comes in this way to its own. For the common school, however, it would be sufficient for the teacher to make it plain that the religious lesson will deal with religious and denominational duties.

(b) Religious and denominational duties. TThis is argued that the principal motives to right conduct are theological, the reply must be that the trend of modern times is to appeal to human motives in conduct, and that an ethical position is still useful. Here the world is true to itself, as at the conclusion of the school, it implies that the sufficiency of human motives for right action. The argument is further weakened by the divergence of theological lessons of one kind or another are becoming frequent all over the world.

Finally, it is clear that the phrase ‘religious education’ is a nonsense if we are considering the subject as part of the ordinary religious instruction in the home and schools, as they stand in the Bible, with the explanations of them given in most Protestant and Roman Catholic catechisms, and the difference between Bible morality and modern morality will be obvious. This is not a question as to whether the Bible is also the religion of the Church or bears to kill the children who mocked Elisha, or accepted such

1 Religion itself I take to mean a body of truths or beliefs respecting God and our relation to Him; and flowing from these a collection of duties which have a peculiar connection with our nature and tendencies as moral agents. These are, in the main, the functions of the will in the form of exercises of internal and external worship. Out of these are several distinctions which are of a religious character, which we call religious sentiments. They include love, gratitude, sorrow, fear, and a sense of the horror of sin, and a consciousness of guilt (Fyfe Michael Miller, S.J., in Papers on Moral Education, communicated to the First International Moral Education Congress, 1909, p. 175).

2 If the Jehovah who instructed Jacob to cheat Laban, fated toshua to massacre the women and children of Jericho, and bears to kill the children who mocked Elisha, or accepted such
must be interpreted in different moral terms, and a person brought up strictly on Bible morality would be fitted only for Bible times and not at all adapted for change. The Bible, therefore, may be used by the teacher of morals as one only out of many sources of moral insight and inspiration.

We conclude, therefore, that for all practical purposes moral education must be separated from religious education.

(b) Intellectual, physical, aesthetic, and professional education.—The closer study of educational purposes demonstrates more and more that the concept ‘education’ has various aspects which can be separated with comparative ease. Moral education has consequently come to be regarded as a distinct branch of education. To this the objection is still sometimes offered, that since, as is alleged, intellectual education tends to make children truth-loving and true, or physical education makes them courageous and upright, therefore moral education is superfluous. A careful examination, for which we have no space here, would show that there is little truth in these contentions, and that, on the whole, each branch of education has to look after itself, if it is to achieve solid results, although it may justly rely on some support being given to it by each of the other branches.

It might further be argued that ethics should not be treated as separate from science and philosophy, the whole of education. To this the reply is that these two means are non-exact; that the schoolteacher in every class promotes the physical education of the children by insisting on proper postures and movements, and by teaching aspects in his subject connected with physical culture, even though there be a separate gymnastic class; so discipline and indirect moral instruction do not exclude systematic moral teaching. They are complementary and independent. As to the fact that the formation of character is generally judged to be the chief aim in education, this can make no difference to the need of separate teaching for the purpose of conveying clear and connected impressions of the moral realities.

We have seen that moral education is to be distinguished from religious, intellectual, physical, aesthetic, and professional education. We must inquire now what this form of education aims to compass.

c) Support of the present regime.—If moral education demanded obedience solely, its purport would be readily divined, for children would simply be taught to do what they are commanded by parents, teachers, masters, and magistrates; and to be satisfied with the economic and social position in which they may happen to find themselves. This code of morals is not by any means a rarity to-day; and its influence, in part at least, is favoured in many quarters. For instance, the large majority of French text-books on moral instruction were, until recently, emphatic on the point that the Great Revolution had achieved everything of moment for the good of France, and that dissatisfaction with present conditions argued, therefore, an unEthical state of mind. There is no future in the schools for such a non-progressive morality.

(d) Abstract moral conceptions.—It is also easy to define moral education in abstract moral terms. Obedience, as the common commands of duty, hearkening to the voice of conscience, whether our will is free, the heinousness of sin, the hauntings of remorse, and the necessity for repentance are such abstract moral conceptions. Even general references to ‘virtues’ and ‘vices’ are not out of place, but alter materially the effect of the teaching, for in all these cases the moral lessons do not tell the young what to do and what to leave undone. The higher the censure and the pleasure-hunter, the iller the hommage as is offered in the 69th Psalm, the higher we are to be regarded not as a conception relative to a barbarous age, but as an authority for all ages and all times. It is true that the lesson of the one God, then it would invidiously follow that the rulers of the modern world, they have not usually been prepared for their duties, and they have other educational duties to fulfill, and there are no authoritative manuals to inform them how to educate their children morally. Under these circumstances it is only the general pressure and influence of the environment which guide and correct the education given.

One striking exception alone exists up to the present—that referring to the education of infants. Here a multitude of definite rules are given, essentially the same as those in the modern sense, a moral being. (Canon Glazebrook, in Papers on Moral Education at the First International Moral Education Congress, p. 155.)
EDUCATION, MORAL

obstacles, to the great relief and benefit of both parents and
infant. Accordingly it is wisely suggested that every young woman
and man (and every young man and woman) who is to visit for a
week or a cradle (or other scientifically conducted nursery) for
the first time, should have two weeks' experience of nursery life.
A second or three more significant steps is being already taken.
Young women, trained in kindergartens, learn how to nurse and employ young children,
and how to control the ultimate, in the exercise of their pont
session, on intelligent anticipation, cheerfulness, serenity,
loving care, courtesy, and respect for the child's love of liberty.
No corporal punishment, no pushing or pulling, no scolding,
shouting, or argumentation, no harshness, no bribing,
no alternative between forbidding and granting everything,
appeals to low motives, no base promises or excuses are re
sented, and yet the educational results are far more satisfac
rory than they used to be. The evident conclusion is that
prospective parents should train themselves to be trained as
are kindergarten nurses and teachers; and, considering the
simplicity of the training and the thoroughly unwise education
which is too common, opinion should not be divided on the
matter. The only drawback—which is, however, a serious one—is that this education, as now given, does not prepare for any high calling. A positive scheme of ethics, such as we have
sketched, must supplement the mere training in cheerfulness
and correctness; and be able to build up a strong character on
playing a worthy part in life must be the objective.

The above method of dealing with infants and young children
indicates the general lines of a sound system of moral educa
tion. The children, at all stages of development, must have
something to do both in the way of amusement and employ
ment, and the parents must know how to treat them.
The children trained in kindergartens growing in the house
and in helpfulness generally. Devotion to the right, love of
jury, and the loss of her income, perseverance, courtesy, modesty,
exactitude in observation and in giving accounts or making
statements, independent thought, carefulness in generalizing,
love of truth and the love of learning, of nature art, strenuous
ness and love of work, temperance in the classic sense, and
simplicity of living should be among other virtues, inculcated
in the home according to the stage of development of the
young. Children should learn, too, to do what is right and
reasonably not intently, intelligently, cheerfully, cheerfully
and rapidly. In the adolescent period the parent should be the
trusted friend of the youth or maiden; purity, sobriety, industry, desirable companions, love of nature, art, and learn
ing, and devotion to good causes should be particularly
encouraged.

We may divide moral education into four periods:
(i.) from birth to the age of two-and-a-half; (ii.) from two-and-a-half to seven; (iii.) from seven to about twenty-one; and (iv.) from twenty-one onwards. In the first period, when the child cannot
async or be easily controlled with, we consider
more especially the formation of good habits; in the second,
when the child possesses just about sufficient understanding to comprehend commands, his character is to be moulded chiefly by obedience;
in the third period, the child's formation is the primary object, and,
and, naturally, self-direction is the main motive
force. In the third period, the formation of good
habits must be continued throughout the second,
third, and fourth stages; the appeal to obedience throughout the third and fourth stages; the method of commutation through the fourth stage; and,
and, indeed, the four methods are applicable, in
varying degrees, to all the four stages.

The following aspects are discernible in a well
considered system of moral education:—

(1) The nature of the morality taught and the principal methods employed have to be fixed, as we have done above.

(2) Since the child has two teachers in his
parents, and since harmony and efficiency in the
education are essential, two conditions at least ought
to be satisfied. In thinking of marriage, the
suitability of the contemplated partner should
be weighed from this point of view. Secondly, hus
bands and wives must endeavor to eliminate all points of
differences in educational opinions which may exist between them. The parents must also
do their utmost to prepare themselves for the task
of educating their offspring. Perhaps in time a
weekly or monthly magazine devoted to the
educational problems of parents seems a necessity.

(3) The general organization of the home
will be more or less rigid and necessary, and
show neither rigidity nor weakness. The
children should be supplied with everything
necessary for their moral, intellectual, and physical
well-being. The playrooms and physical
places to be in and to play in. Things will be so
arranged in the home that the children are not
exposed to mischief. The songs, the toys, the
books, the picture-books, the stories told, are
all suited to the children's ages, and the
domestic animals should, as is becoming
increasingly the case, largely promote the moral
aim of home education. In short, an ethical spirit
should determine the whole organization.

(4) Example is of far-reaching importance
with the young. Dependent on their environment, they
adopt the ideas of those surrounding them; they
imitate their actions, their bodily attitudes, their
tone of voice, and what is recognized, the
inhabitants, their feelings. Overflowing with energy
and living in the present, the young child possesses,
true, little self-control; but intelligent antici
pationand strictness of execution are not sufficiently
consistent, and cheerfulness on the part of the
children prevent passionateness and vacillation from be
coming permanent in the child, and thus pave the
way for the acquisition of whatever virtues his
guardians possess.

(5) Incidental moral teaching was almost con
tinuous under the old conditions. The child is
easier to act, and also soon gets tired of any par
ticular course of action; therefore, when his
amusements are not scientifically regulated, he
appears to be thinking of nothing but mischief,
and remonstrances become inessential. Still, even
under the most favourable conditions, many an
occasion presents itself for pointing a moral. We
can thus, by noting the moral successes and failures in
conduct, impress the need for doing what is right and reasonable unhesitatingly, intelligently, and
so forth.

(6) Indirect moral teaching should not be left
totality to chance. Various personal and social
problems should be discussed (with due regard to
the age of the child) from an ethical point of view,
and provision be made in order that such
opportunities should not be lacking. Occurrences
in the home, public events, the reading of a story,
and the learning of a lesson may all be made
occasions for indirect moral teaching.

(7) Direct moral teaching should also be given.
The young are interested in issues concerned with
discuss, and, if we approach them intelligently
and sympathetically—sentimentality and sermon
izing being excluded—we can talk over with them
their own conduct, the conduct of others, and
moral ideas and ideals generally. In this way,
a lively sense of their duties and of their strong
points and failings may be generated in their
character to a large extent determined. This
would make superfluous many robes, and pre
vent the child from forgetting what he is to do
and what he is to leave undone. How to do better
than well rather than how not to do ill should be
the burden of incidental, indirect, and direct moral
teaching.

(8) Systematic moral teaching would be implied
in the above. The teacher as special instruction in morals
is concerned, but systematic teaching proper in
volves teaching where the various ideas are, so far
as possible, co-ordinated and comprehended in a
system. Systematic teaching in the home, taking
for granted the rising stages of development, would
mean that one important problem after another
would be approached, and its bearing on present
military service, and prepare men and women for
the duties of adult life.
and future life and conduct investigated. The aim of such set tasks is the attaining of clear and comprehensive moral ideas, and the communication of a general enthusiasm for the right. Given a reasonable family life and a simple ideal, this should lead to a rationalistic teaching being the rule in every subject, there can be no objection to systematic moral teaching.

(9) Environmental factors have important bearing. (9) Without tacitly assuming a certain economic influence in the family, and a certain social environment favourable to right conduct. These assumptions fall wide of the mark if the average family is considered, where the income is generally so meagre that scarcely anything beyond the barest necessities can be procured, while bad economic conditions and low moral standards lead to much misery and unrighteous dealings. Owing to these and other causes—not least the absence of efficient moral education—impartial, intemperance, idleness, ignorance, lack of sympathy and economic exploitation are widespread. Consequently, the school family is almost bound to fail to a considerable extent in the task of moral education, whilst the unpropitious social conditions create further obstacles. The moral educator is thus commonly also a social reformer. (10) The formal and the real problems of the school and home are largely the same, and we have, therefore, implicitly dealt to some extent with the school in speaking of the home and of moral education in general. Let us summarize the points. (1) There must be a system of morals which the teacher can utilize; (2) the teacher must be efficiently trained; (3) he should have a strong personality; (4) the school should be effectively organized for this purpose; there should be (5) incidental, (6) indirect, (7) direct, and (8) systematic ethical teaching; (9) the environment must not be decidedly unfavourable to right conduct; and (10) school and home must be properly correlated. We shall deal with these points separately.

(1) The nature of the ethics to be taught at school will naturally be the same as that inculcated in the home, only that the school life lends itself better to the practice of the social virtues. The principles governing the discipline will also be precisely the same, except that greater care will be taken to adapt the rules to the individualities of the children coming from various homes, and that special care is necessary since the children are usually massed together for nearly an hour at a time. To ensure adequate attention to the pupils' needs, the teachers should preferably be class-teachers, and should remain some three years with the same set of children.

(2) The moral training of the young must be undertaken by efficient teachers. Moral education demands, therefore, that the teaching profession should be sufficiently respected and remunerated to attract men and women of character and ability, and that the respective teachers should be thoroughly prepared in training colleges and otherwise. This preparation should include special training and teaching in morals, in order that teachers should be familiar with the meaning and the task of moral education.

(3) The personality of the teacher, and particularly that of the headmaster, is of importance, especially where the school, as used to be the case, must come into contact with the pupil for many years. In the latter case almost everything depends on the influence of the headmaster, and this is due to the altogether exaggerated estimate of the teacher's personality with which the pupil is familiar. It is the personality of the teaching staff, however, that has no small significance even to-day, considering that the teacher are to the child the living embodiment of the purpose for which the school exists.

(4) We need not enumerate here the various factors which go to the making of a well-organized school. These are well known. We lay stress on only a few points: (2) that the training of the pupils is the school's chief aim. The average number of children in a class should not exceed twenty-five; no more in the way of teaching results is to be expected than is consistent with thoroughness in training and teaching; the teacher should have sufficient leisure to continue his education; the teaching staff should be actively interested in the welfare of the pupils, and should also organize games and amusements; self-reliance and co-operation among the pupils should be encouraged; and a decided ethical tone should be traceable in the school decorations. Following the practice of the American School Republics, many tasks should devolve upon the pupils, and a strong and healthy corporate spirit should be cultivated among them. The school should be in close touch with the home, and it should be understood that pupils (10) be exposed to the larger world by visits and excursions of various kinds. The ethical atmosphere of the classroom needs, however, special mention. Just as every teacher is at all times expected to watch over the pronunciation of the pupils, and they express themselves clearly, intelligently, fluently, and concisely, so the ethical purpose of the school demands that at least the following moral qualities be kept constantly and consciously in view by the teacher: courtesy, love of truth, broad-mindedness, strenuousness, courage, orderliness, kindness, uprightness, and simplicity of living.

(6) Incidents are uncommon to-day in a good school, and consequently little room is found for incidental moral teaching. Even where an 'incident' occurs, the good teacher usually finds it far more effective to confer privately with the culprit than to play to the gallery. It is inconceivable that in a well-conducted school the moral teaching should be confined to incidental moral instruction, though it can be easily understood why in former days, when the teaching methods were ill- devised and the disciplinary measures harsh, incidental moral teaching had a large scope.

(6) Indirect moral instruction is moral instruction arising out of the teaching for its own sake, and another of the curriculum. The history and the literature lessons are peculiarly suited to this. In addition, the physiology lessons are sometimes made the channel of inculcating general rules of health, the moral history lessons of animals, and the domestic science lessons for the household virtues.

Until recently such indirect moral instruction was rare, and there were many warnings uttered against it; e.g. educationists urged that one must not introduce an irrelevant subject; that it is not practical to attempt to kill two birds with one stone; that one must beware of falsifying facts to suit ethical ends; and that the class is not the place for moralizing and sermonizing. There used to be legitimate grounds for this objection, but the chief one being that the school was at that time intellectualistic and optimistic in aim, and that the study of history is the record of the growth of civilization, and not merely as an account of military exploits. Illustrative of this fundamental change is also the fact that the New School Authority conceives of geographical teaching as tending primarily to show the moral condition of the people—at peace and the interdependence. Similarly, German and French School Readers now supply plentiful material of an ethical character, while frequently one of the exercises is a piece of moral thinking, whether or not an ethical spirit pervades it. Even arithmetic will soon be looking for the same. The pupils are not thinking rather than as meaningless juggling with figures; and in high educational quarters the permeation of aesthetic culture—music, singing, drawing, painting, modelling—with an...
ethic spirit is coming to be taken for granted. In a word, the whole curriculum is about to be ethicized, and in a generation or two we may expect every subject to be primarily ethical in character, with signal advantage to the particular subject (since such education is interesting) has had to do much preaching of a little teaching, and is, therefore, to be ruled out of court. On the contrary, we are bound to recognize that for one person whom nothing daunts, nineteen are, for good or evil, sensibly affected by their environment. Accordingly, we must admit that home and school to-day are not all-powerful, and cannot send out into the world ideal men and women, or ensure that their charges will not morally suffer when plunged into the whirlwind stream of social life. There is need, therefore, for the social re-former, and the school must create him. Much, indeed, in the school itself depends on the spirit which pervades society: e.g. scholars are herded together—50, 60, or 70 in a class—and leave school several years before they should, and teachers are poorly trained and ill paid. Probably, until the national character on education is at least doubled, the school will not be able to grapple effectively with the problems it has to face, nor until then will it yield a 'high rate of interest.'

(10) School and home.—A child well brought up at home is better scholar, for such a child eagerly and easily learns. If the home does its duty, the task of the teacher is, therefore, incalculably simplified. In fact, if home education approached perfection, school education would either be superfluous or follow lines different from the present ones. Well-bred children would possess the intellectual virtues (so far as the stage of development they had reached permitted) which the school is now inculcating with infinite pains and with relatively small success: e.g. careful observing, judging, and generalizing, a good memory, and vigorous independent thinking; and consciencc, readiness, polish, and clearness in speech and writing. They would also possess in a high degree the school virtues of punctuality, regularity, orderliness, neatness, attentiveness, industry, and courtesy; and, accordingly, the educational methods might demand much more of the child—working without supervision, co-operating with other children—making the influence of the school co-terminous with waking hours, and consequent circumstances the school would not feel obliged to cram the children with 'necessary' knowledge; it would chiefly teach them how to learn, and the school's work it would mostly leave to the consultation with works and books of statistics at home and at school; to observation, experiments, private reflection, art galleries, museums, travel; and, not least, to the reading and the study of the great literary, scientific, and philosophical classics. This being the relation between school and home, it is essential that the two should come into close contact, and even be co-ordinated.

At present, in spite of various efforts, the school has succeeded only to an insignificant degree in keeping in touch with the home. Parents do not call on the teacher; they are occasionally invited to attend lessons, examinations, and festive functions; they receive periodical accounts of the children's progress and conduct; they are asked to assist the children with their "home work," and to interest themselves in the children's school life; occasional parents' evenings are organized; in a few instances teachers visit the parents and the children, and also organize the children's amusements outside school; and in rare cases the parents as a body are admitted to the school's committee of management. The subject of the relation between school and home is one which warrants a special investigation being undertaken with a view to making far-reaching proposals, since scarcely anything could be of such advantage as a clear insight into the life of the school in the home, and the home's attitude to the school's instruction.
EDWARDS AND THE NEW ENGLAND THEOLOGY. — Jonathan Edwards, saint and metaphysician, revivalist and speculative theologian, stands out as the one figure of real greatness in the intellectual life of colonial America. Born, bred, passing his whole life on the verge of civilization, he has made his voice heard wherever men have busied themselves with those two greatest topics which can engage human thought—God and the soul. A French philosopher of scant sympathy with Edwards' chief concern, wrote, "There are few names of the eighteenth century which have obtained such celebrity as that of Jonathan Edwards. Critics and historians are still puzzled as to where to place in Edwards' marvelous ramble terms the logical vigour and the constructive powers of a writer whom they hold as (is done by Mackintosh, Dugald Stewart, Robert Southey, and even Gibbon) to have been the greatest of all the intellectual revolutionaries. He has made of physiognomy America has yet produced. Who knows, they have asked themselves, what would have risen, if, instead of being born in a half-savage country, far from the traditions of philosophy and science, he had appeared rather in the old world, and the sparks of science would have impinged on the modern mind. Perhaps he would have taken a place between Leibniz and Kant among the great minds. He would have been the father of a new school of moral systems, instead of the work he has left reducing itself to a sublime and barbarous theology, which astonishes our reason and outrages our hearts, the object of at once our horror and admiration.

Edwards' greatness is not, however, thus merely conjectural. He was not the erudite, inglorious Milton, but the most articulate of men. Nor is it as a metaphysician that he makes his largest claim upon our admiration, subtle metaphysician as he showed himself to be. His ontological speculations, on which his title to recognition as a metaphysician mainly rests, belong to his extreme youth, and had been definitely put behind him at an age when most men first begin to probe such problems. It was, as Lyon indeed suggests, to theology that he gave his mature years and his most prolonged and searching thought, especially to the problems of sin and salvation. And these problems were by him treated both more theoretical, but as intensely practical ones. Therefore he was a man of action as truly as a man of thought, and powerfully wrought on his age, setting at work energies which have not yet spent their force. He is much more accurately characterized, therefore, by a philosopher of our own, who is as little in sympathy, however, with his main interests as Lyon himself. F. J. E. Woodbridge says: 2

"He was distinctly a great man. He did not merely express the thought of his time or meet it simply in the spirit of his tradition. He stemmed it and moulded it. New England thought was already moldering towards that colorless-theology which marked it later. He was not a mere Calvinist, nor an Arminian. He made it Calvinistic... His time does not explain him.

Edwards had a remarkable philosophical bent; but he had an even more remarkable sense and taste for Divine things; and, therefore (so Woodbridge concludes, with at least relative justice), we remember him not as the greatest of American philosophers, but as the greatest of American Calvinists."

1. The period of Edwards' preparation. — It was a very decadent New England into which Edwards was born, one marked by the decay of Puritanism, by which the Puritans had brought with them into the New World had not been able to

2 The Philosophical Review, xill, 1901, 405.
EDWARDS AND THE NEW ENGLAND THEOLOGY

propagated itself unimpaired to the third and fourth generation. Edwards in 1767, whose mother had warned that 'the body of the rising generation is a pit, perishing, unconverted, and (except the Lord pour down His Spirit) an undone generation.' These general warning currents of fear and of hope were so intense at this epoch, depressing to the life of the spirit, which were not unfelt in New England; and these were reinforced there by the hardness of the conditions of existence in a raw world. Everywhere thinking and living alike were moving on a lowered plane; not merely spirituality but plain moral was suffering some eclipse. The churches felt compelled to recede from the high ideals which had been their hor- aitige, and were introducing into their membership and admitting to their mysteries men who, though decent in life, made no profession of a change of heart. If only they had been themselves bap- tized, they were encouraged to offer their children for baptism (under the so-called 'Half-Way Coven- ant'), and to come themselves to the Table of the Lord (conceived as ' converting ordinance'). The household into which Edwards was born, however, not only protected him from much of the evil which was pervading the community, but powerfully stimulated his spiritual and intel- lectual life. He began the study of Latin at the age of four, and by thirteen had acquired a respect- able knowledge of 'the three learned languages', which at the time formed part of the curricula of the colleges—Latin, Greek, and Hebrew. Before he had completed his thirteenth year (Sept. 1716), he entered the ' Collegiate School of Connecticut' (afterwards Yale College). During his second year at college he fell in with Locke's Essay con- cerning Human Understanding, and 'had more satisfaction in the pleasure in study ing it,' he told himself; 2 than the most greedy miser in gathering up handfuls of silver and gold from some new-discovered treasure. He graduated at the head of his class in 1729, when he was just short of seventeen years of age, but remained at college (as the custom of the time was) two years longer (to the summer of 1722) for the study of Divinity. In the summer of 1722 he was 'appropos'd to preach, and from Aug. 1722 until April 1726 he supplied the pulpit of a little knot of Presby- terians in New York City. 3 Returning home, he was appointed tutor at Yale in June 1724, and fitted himself with living ability during a most trying period in the life of the college, there is no record of the next two years (until Sept. 1726). His resigna- tion of his tutorship was occasioned by an invita- tion to become the colleague and successor of his grandfather, Solomon Stoddard, in the pastor- ate of the church at Northampton, Mass., where, accordingly, he was ordained and installed on 15th Feb. 1727.

Pascal, he declares; such a complexion is much too modest; the young Edwards united in himself many Passes, and, by a double miracle, combined with them gifts by virtue of which he far surpassed his predecessors and a Newton. Yet to believe is not merely that a boy in his teens he worked out independently a system of metaphysics, and that of Berkeley, but that he anticipated most of the scientific discoveries which constitute the glory of the succeeding century.

It is well to recognize that Lyon has permitted himself some slight exaggerations; in stating his case, he has presented ex- amination of the MSS which he, and, following him, A. Y. G. Allen asked for, has fully vindicated the youthful origin of these discourses. The first essay was written on the immaturity of the soul, full of marks of immaturity, with no doubt, but equally full of the signs of genuine genius, but written in 1717-1718, when Edwards was ten years old. There are some very acute observations on the behaviour of spiders spinning the webs which anticipated the reality of modern investigation, but which cannot have been written later than his thirteenth year. There are, above all, metaphysical discus- sions of 'Being,' 'Atone,' and 'Pregnancy of Imagination,' written at least as early as his junior year at college, that is to say, his sixteenth year, in which the fundamental ideas of his Idealist philosophy are fully set out. And, besides numerous other discussions following out these views, there is a long series of notes on natural science, filled with acute sugges- tions, which must belong to his Yale period. It is all, no doubt, very remarkable, but this only shows that Edwards was a very remarkable youth.

It is in these youthful writings that Edwards propounds his most spiritualistic metaphysics, and is chiefly on the strength of them that he holds a place in our histories of philosophy. His whole system is already present in substance in the essay Of Being,' which was written at the age of sixteen years. And, though there is no reason to believe that he ever renounced the opinions set forth in these youthful discussions—there are, on the contrary, occasional suggestions, even in his latest writings, that are at the back of his brain—he never formally returned to them subsequently to his Yale period (up to 1727). 4 His engagement with such topics belongs, therefore, distinctively to his formative period, before he got engaged with the eager, enterprising, and the active mind and the lines of thought more im- mediately called into exercise by them. In these early years, certainly independently of Berkeley, 5 and apparently without any suggestion from outside beyond what might be derived from Newton's explanations of light and colour, and Locke's treatment of sensation as the source of ideas, he worked out for himself a complete system of Idealism, which wavered indeed in the brink of more phenomenalism, and might have betrayed him into Pantheism save for the intensity of his perception of the living God. 'Speaking most strictly,' he declares, 'there is no God but God Himself.' The universe exists 'nowhere but in the Divine mind.' Whether this is true 'with respect to bodies only; or of finite spirits as well, he seems at first to have waved; ultimately he came to the more inclusive opinion of God's.

He could write of the rise of a new thought: 'If we mean that there is some substance besides that thought, that brings that thought forth; if it be God, I acknowledge it, but if there he meant some thing else that has no properties, it seems to me absurd. 6 Of 'all dependent existence whatever' he comes at last to affirm that it is 'in a constant flux,' 'renewed every moment, as the colours of bodies are every moment by the light that shines upon them; and all is nothing proceeding from God, as light from the sun.' 6 He did not mean by this, however, to sublimate the universe in a shadowy Ideal, but was only attempting to declare that it has no other substrate but God that its reality and presence are grounded, not in

7 E. G. Smith and H. N. Gardiner, loc. cit.; it is now known that he had not read Berkeley before 1730 (Dexter, Some MSS of Jonathan Edwards, as before).
some mysterious created 'substance' underlying the properties, but in the 'infinitely exact and precise Divine idea, thing, and the perfectly exact, precise, and stable will, with respect to corresponding communications to created minds and effects on their minds.' He is engaged, in other words, in a purely ontological investigation, and his contention is merely that God is the continuum of all finite existences, as far as possible from denying the reality or persistence of these finite existences; that God is to him not 'creations,' because they represent a fixed purpose and an established constitution of God.

Edwards was not so absorbed in such speculations as to neglect the needs of his spirit. Throughout all these formative years he remained first of all man of religion. He had become the subject of deep religious impressions from his earliest boyhood, and he gave himself, during this period of preparation, to the most assiduous and intense cultivation of his religious nature. 'I made seeking my salvation,' he himself tells us, 'the main business of my life.' But about the time of his graduation (1720) a change came over him, which relieved the strain of his inward distress. From his childhood, his mind had revolved against the sovereignty of God: 'it used to appear like a horrible doctrine to me.' Now all this passed unobservedly away; and gradually, by a process he called 'the work of Edwards,' this very doctrine came to be not merely a matter of course to him but a matter of rejoicing: 'The doctrine has often appeared exceedingly pleasant, bright, and sweet; a solemn thing and I love to prescribe to God.' One day he was reading 1 Thes. 4,17 Now under the King, eternal, immortal, invisible, the only wise God, be honour and glory, for ever and ever, Amen, and, as he read, 'a sense of the glory of the Divine Being' took possession of him, 'a new sense, quite different from anything he ever experienced before.' He longed to be 'tapp to Him in heaven, and be, as it were, swallowed up in Him for ever.'

From that moment he became fully interested in the religious things of life, and his enjoyment of God grew. There were, no doubt, intervals of depression. But, on the whole, his progress was steadily upward and his consecration more and more complete. It was this devout young man, with the joy of the Lord in his heart, who turned his back in the early months of 1727 on his brilliant academic life and laid aside for ever his philosophical speculations, to take up the work of a pastor at Northampton.

2. Edwards the pastor.—Edwards was ordained co-pastor with his grandfather on 15th Feb. 1727, and on his father's death, two years later, succeeded to the sole charge of the church. Northampton was relatively a very important place. It was the county town, and nearly half of the area of the province lay within the county. It was, therefore, a sort of little local capital, and its people prided themselves on their culture, energy, and independence of mind. There was but the one church in the town, and it was probably the largest and most influential in the province, outside of Boston. It was not united in sentiment, being often torn with factional disputes. But, under the strong preaching of Solomon Stoddard, it had been repeatedly visited with revivals. These periods of awakening continued with intervals during Edwards' pastorate; the church became famous for them, and its membership was filled up by them. At one time the membership numbered nearly the entire adult population of the town. Stoddard had been the

proponent for the laxer view of admission to Church ordinances, and early in the year 1740 introduced into the Northampton church the practice of opening the Lord's Supper to those who made no profession of conversion. In this practice Edwards at first acquiesced; but he became convinced that it was wrong, soon after he came to correct it, with disastrous consequences to himself. Meanwhile it had given to the membership of the church something of the character of a mixed multitude, in which the number of large numbers of them had been introduced in the religious excitement of revivals had tended to increase.

To the pastoral care of this important congregation, Edwards gave himself with single-hearted devotion. Assiduous house-to-house visitation did not, it is true, form part of his plan of work; but this did not arise carelessness or neglect; it was in accordance with his deliberate judgment of his special gifts and fitnesses. And, if he did not go to his people in their homes, save at the call of illness or special need, he encouraged them to come freely to his house and grudge no labor or trouble in meeting their individual requirements. He remained, of course, also a student, spending ordinarily from thirteen to fourteen hours daily in his study. This duty did not separate itself from, but was kept strictly subsidiary to, his service. Not only had he turned his back definitely on the purely academic speculations which had engaged him so deeply at Yale, but he produced no purely theological works during the whole of his twenty-three years' pastorate at Northampton. His publications during this period, besides sermons, consisted only of treatises in practical Divinity. They dealt principally with problems raised by the great religious awakenings in which his preaching was fruitful.

Such, for instance, are the Narrative of Surprising Conversions, published in 1736, the Thoughts on the Revival of Religion in New England in 1740, published in 1742, and that very searching study of the movements of the human soul under the excitement of religious motives called A Treatise concerning Religious Affections, published in 1746. Then there is the Humble Attempt to Promote Explicit Agreement and Visible Union of God's People in Extraordinary Prayer for the Revival of Religion, etc., published in 1740, which belongs to the same class, and the brief Account of the Life of the Rev. David Brainerd, published in the same year. There remains only the Historical Inquiry into the Nature, Connexion and Design of God, concerning the Qualifications requisite to a Complete Staining in Full Commission in the Visible Church of God, published in 1746, along with which should be cited the unveiling of its contents. But this was not published until somewhat later (1763). No doubt there was much more of this written during these years, or even more of the years before; for Edwards was continually adding to the mass of his manuscript treasures; and some of these voluminous 'observations' have since been put into print, although the greater part of them remain yet in the note-books where he wrote them.

It was in his sermons that Edwards' studies bore their richest fruit. He did not spare himself in his public instruction. He not only faithfully filled the regular appointments of the church, but freely undertook additional discourses and lectures, and during times of 'attention' he frequently went to the aid of the neighboring churches. From the first he was recognized as a remarkable preacher, as arresting and awakening as he was instructive. Filled with himself with the deepest sense of the heinousness of sin, as an offense against the majesty of God and an outrage of His love, he set himself to arouse his hearers to some realization of the horror of their condition as objects of the Divine displeasure, and to bring home the precious goodness of God in intervening for their salvation. Side by side with the most moving portrayal of God's love in Christ, and of the blessedness of communion with Him, he set forth, with the most startling effect, equally vivid

1 Dwight, I. 674.
3 Dwight, i. 59.
pictures of the dangers of unforgiven sin and the terrors of the lost estate. The effect of such preaching, to be conceived of one who has been the subject of the sincere, fervent self-deception, was overwhelming. A great awakening began in the church at the end of 1735, in which more than 300 converts were gathered in, and it spread throughout the churches along the Connecticut valley. In connection with a visit from Whitefield in 1740 another wave of religious fervour was started, which did not spend its force until it covered the whole land. No one could recognize two fully that Edwards the evil was to mix with the good in such seasons of religious excitement. He diligently sought to curb excesses, and earnestly endeavoured to separate the chaff from the wheat. But no one could protest more strongly against casting out the wheat with the chaff. He subjected all the phenomena of the revivals in which he participated to the most searching analytical study; and, while sadly acknowledging that much self-deception was possible, and that the rain could only too readily be given to false "enthusiasm," he earnestly contended that a genuine work of grace might find expression in evidence even physical. It was one of the incidental fruits of these revivals that, as we have seen, he gave to the world in a series of studies perhaps the most thorough examination of the phenomena of religious excitement, and the most thorough treatise on the Religious Affections, one of the most complete systems of what has been strikingly called "spiritual diagnoses" it possesses.

For twenty-three years Edwards pursued his fruitful ministry at Northampton; under his guidance the church became a city set on a hill to which all eyes were turned. But in the reaction from the revival of 1740-1742 conditions arose which caused him great searching of heart, and led ultimately to his separation from his congregation. In this revival, practically the whole adult population of the town was brought into the church; they were admitted under the excitement of the time and under a ruling introduced as long before as 1704 by Stoddard, which looked upon all the ordinances of the church, including the Lord's Supper, as "converting ordinances," not presupposing, but adapted to bring about, a change of heart. As time passed, it became evident enough that a considerable body of the existing membership of the church had not experienced that change of which the church alone could constitute the evidence, and indeed they made no claim to have done so. On giving serious study to the question for himself, Edwards became convinced that participation in the Lord's Supper could properly be allowed only to those professing real conversion. It was his duty as pastor and guide of his people to guard the Lord's Table from profanation, and he was not a man to leave unperformed a duty clearly perceived. Two obvious measures presented themselves to him—unworthy members of the church must be excised by discipline, and greater care must be exercised in receiving new applicants for membership. No doubt discipline was among the functions which the Church claimed to exercise; but the practice of it had fallen much into decay as a sequence to the lowered conception which had come to be entertained of the requirement, so delivered with disciplinary membership. The door of admission to the Lord's Supper, on the other hand, had been formally set wide open; and this loose policy had been persisted in for half a century, and was retained as the Traditional. What Edwards felt himself compelled to unerringly, was a return in theory and practice to the original platform of the Congregational churches, which conceived of the Church as the visible gatherer of the sincere, and in the words, "a company of saints by calling," among whom there should be permitted to enter nothing that was not clean. This, which should have been the Christian profession of all the churches with the victory to the movement which he inaugurated throughout the churches of New England, was in his personal case his weakness. It gave a radical appearance to the reforms which he advocated, with the result that he was far from receiving them. It is not necessary to go into the details of the controversy regarding a case of discipline, which emerged in 1744, or the subsequent difficulties (1748-9) regarding the conditions of admission to the Lord's Supper. The result was that, after a sharp contest running through two years, Edwards was dismissed from his pastorate on 22d June 1750.

3. Edwards the theologian.—By his dismissal from his church at Northampton, in his forty-seventh year, the second period of Edwards' life—the period of strenuous pastoral labour—was brought to an abrupt close. After a few months he removed from the region where (though he were only twelve white families resident there) of Stockbridge, as missionary of the 'Society in London for Propagating the Gospel in New England and the Parts Adjoining' to the Housatonic Indians, there at fifty years of age in the church of white settlers. In this exile he hoped to find leisure to write, in defence of the Calvinistic system against the rampant 'Arminianism' of the day, the works which he had long had in contemplation, and for which he had made large preparation. Peace and quiet he did not find; he was embroiled from the first in a trying struggle against the greed and corruption of the administra tors of the funds designed for the benefit of the Indians. But he made, if he could not find, the requisite leisure. He was at Stockbridge that he wrote the treatises on which his fame as a theologian chiefly rests; the great works on the Will (written in 1758, published in 1754), and Original Sin (in the press when he died, 1758), the striking essays on The End for which God created the World, and the Nature of True Virtue, published 1759, after his death, and the unfinished History of Redemption (publ. 1772). No doubt he utilized for these works material previously collected. He lived practically with his pen in his hand, and the idea of a thousand pages of a thousand pages,—his 'best thoughts,' as it has been felicitously called. The work on the Will, indeed, had itself been long on the stocks. We find him making diligent studies for it already at the opening of 1747; and though his work on it was repeatedly interrupted for long intervals, he tells us that before he left Northampton he 'had made considerable preparation and was deeply engaged in the prosecution of this design.' The rapid completion of the book in the course of a few months in 1753 was not, therefore, so wonderful a feat as it might otherwise appear. Nevertheless, it is the seven years at Stockbridge which have been called the fruitful years of Edwards' theological

---

1 According to the organic law of the Congregational churches (the Cambridge Platform), "saints by calling" are such as have not only attained the knowledge of the principles of religion, and are free from gross and open scandals, but also do, together with the profession of their faith and repentance, walk in blameless conduct to the word.

2 Cf. H. N. Gardiner, Selected Sermons, p. xii.

4 Dwight, i, 233, 270, 411.

5 Ib. 506, 535, 557.
work. They were interrupted in the autumn of 1757 by an invitation to him to become the President of the College of New Jersey, at Princeton, in succession to his son-in-law, Aaron Burr. It was with great reluctance that he accepted this call, but the Princeton, which had been founded and thus far carried on by men whose sympathies were with the warm-hearted, revivistic piety to which his own life had been dedicated, had claims upon him which he could not disown. On the advice of a council of his friends, therefore, he accepted the call and removed to Princeton to take up his new duties, in January 1758. There he was inoculated for smallpox on 18th Feb., and died of this disease on 27th March in the fifty-fifth year of his age.

The peculiarity of Edwards' theological work is due to the union in it of the richest religious sentiment with the highest intellectual powers. He was first of all a man of faith, and it is this that gives its character to his whole life and all its products; but his strong religious feeling had at its disposal a mental force and logical acuteness of the highest order; and, as Edwards himself says, and as Ezra Stiles called him, a 'strong reasoner.' His analytical subtlety has probably never been surpassed; but with it was combined a broad grasp of religious truth which enabled him to see it as a whole, and to deal with its several parts without exaggeration and with a sense of their relations in the system. The system to which he gave his sincere adhesion, and to the defence of which, ages and ages after his death, his friends and followers were threatening to undermine it, he consecrated all his powers, was simply Calvinism. From this system as it had been expounded by its chief representatives he did not consciously depart in any of its constitutive elements. The breadth and particularity of his acquaintance with it in its classical exponents, and the completeness of his adoption of it in his own thought, are frequently underestimated. There is a true sense in which he was a man of thought rather than of learning. There were no great libraries accessible in Western Massachusetts in the middle of the 18th century. His whole reading was limited: the subjects which were presented to his thought was reinforced by his habits of study; it was his custom to develop on paper, to its furthest logical consequences, any topic of importance to which his attention was directed. He lived in the 'age of reason,' and was in this respect a true child of his time. In the task which he undertook, furthermore, an appeal to authority would have been useless; it was uniquely to the court of reason that he could hale the adversaries of the Calvinistic system. Accordingly it is only in his more didactic— as distinguished from controversial—treatise on Religious Affections, that Edwards agrees with any earlier writers in support of his positions. The reader must guard himself, however, from the illusion that Edwards was not himself conscious of the support of earlier writers beneath him. His acquaintance with the masters of the system he was defending, for example, was wide and minute. Amesius and Welleius had been his text-books at college. The well-selected library at Yale, we may be sure, had been thoroughly explored by him; at the close of his divinity studies, he speaks of the reading of 'doctrinal books' as a part of his daily business. As would have been expected, he fed himself on the great Puritan divines, and formed not merely his thought but his life upon them. He had, for instance, diligently using Manton's Sermons on the 11th Psalm as a spiritual guide; and in his rare allusions to authorities in his works, he betrays familiarity with such writers as William Perkins, John Preston, Thomas Blake, Anthony Burgess, Stephen Charnock, John Flavel, Theophilus Gile, Thomas Goodwin, John Owen, Samuel Rutherford, Thomas Shepard, Richard Sibbes, John Smith the Platonist, and Samuel Clark the Arian. Even his contemporaries he knew and estimated at their true values: Isaac Watts and Philip Doddridge as a matter of course; and also Thomas Boston, the son of the elder Edwards. The Covenant of Grace he confessed he did not understand, but whose Fourfold State of Man he 'liked exceedingly well.' His Calvin he certainly knew thoroughly, though he would not swear in his words, 'and deeply emotional, and as the great Turretine'; while van Mastricht he declares 'much better' than even Turretin, 'or,' he adds with some fervour, 'than any other book in the world excepting the Bible, in my opinion.' The close agreement of his teaching with that of the best esteemed Calvinistic divines is, therefore, both conscious and deliberate; his omission to appeal to them does not argue either ignorance or contempt; it is in itself the natural manner and to the special task he was prosecuting. In point of fact, what he teaches is just the 'standard' Calvinism in its completeness.

As an independent thinker, he is, of course, not without his individualisms, and that in conception no less than in expression. His explanation of the identity of the human race with its Head, founded as it is on a doctrine of personal identity which reduces it to an 'arbitrary constitution' of God, binding its successive moments together, is peculiar to himself. In answering objections to the doctrine of Original Sin, he appeals at one point to the very language of Stapel, and says, 'in this sense the form of that doctrine as mediate imputation.' But this is only in order to illustrate his own view that all mankind are one as truly and by the same reason as if an individual life is one in its consecutive moments. Even in this immediate context he does not teach the doctrine of 'mediate imputation,' insisting rather that, Adam and his posterity being in the strictest sense one, in them no less than in him the 'guilt arising from the first existing of a depraved disposition' cannot at all be distinguished from the guilt of Adam's first sin'; and elsewhere throughout the longer treatise he objects to the common Calvinistic doctrine. His most marked individualism, however, lay in the region of philosophy rather than of theology. In an essay on The Nature of True Virtue, he develops, in opposition to the view that all virtue may be reduced ultimately to self-love, an eccentric theory of virtue ever, he did like a display of learning. In his earliest maxims, by the side of 'Let me be as sensible as I can be,' he sets this other: 'Let it not look as if I was much read, or was conversant with books, or with the learned world' (Dwight, I. 192.).

1 Dwight, i. 251.
2 Dwight, I. 253. It was not as a does, he was not able to ascertain all the facts concerning this council; Ezra Stiles, Diary, New York, 1801, ii. 4, supplies interesting details.
as consisting in love to being in general. But of this again we hear nothing elsewhere in his works, though it became germinal for the New England theologian, in the treatment of next year's case. In any case are in no way characteristic of his teaching. He strove after no show of originality. An independent thinker he certainly claimed to be, and, 'utterly declining, a dependence,' says, 'on Calvin,' in the sense of 'believing the doctrines he held because Calvin believed and taught them.' This very disclaimers is, however, a proclamation of his agreement with Calvin, although not as if he 'believed everything just as Calvin taught'; he is only suggestions that he should be understood to be not a blind follower of Calvin, but a convinced defender of Calvinism. His one concern was, accordingly, not to improve on the Calvinism of the great exponents of the system, but to place the main elements of the Calvinistic system, as commonly understood, beyond cavil. His marvellous invention was employed, therefore, only in the discovery and development of the fullest and most convincing possible array of arguments in their favor. This is true even of his great treatise on the Will. This is, in the common judgment, the greatest of all his treatises and the common judgment here is right.2 But the doctrine of this treatise is precisely the doctrine of the Calvinistic schoolmen. 'The novelty of the treatise,' we have been long led to believe, lies in the position it takes and defends, but in the multitude of proofs, the fecondity and urgency of the arguments by which he maintains it. Edwards' originality thus consists less in the content of his thought than in his manner of thinking. He enters into the great tradition which had come down to him, and 'infuses it with his personality and makes it live,' and the vitality of his thought gives to its product the vase of a unique creation.3 The effect of Edwards' labours was quite in the line of his purpose, and not disproportionate to his greatness. The movement against Calvinism which was over-sprinkling the land was in a great measure checked, and the elimination of Calvinism as a determining factor in the thought of New England, which seemed to be imminent as he wrote, was postponed for more than a hundred years.4

4. The New England theology.—It was Edwards' misfortune that he gave his name to a party; and to a party which, never in perfect agreement with him in its doctrinal ideas, finished by becoming the party that benefited the most from it (as it has been sharply expressed) of a set of opinions which he gained his chief celebrity by demolishing. The affliliation of this party with Edwards was very direct. Bellamy and Hopkins, says G. P. Fisher, tracing the descent, were pupils of Edwards; from Hopkins West derived his theology; Smalley studied with Bellamy, and Emmons with Smalley. But the inheritance of the party from Edwards showed itself much more practical than the doctrinal on the party. Its members were the heirs of his revivalist zeal and of his awaking preaching; they also imitated his art to attempt to purify the Church by discipline and strict guarding of the Lord's Table in a word to return the Church to its Puritan ideal of a congregation of saints.5

8 On the 'rigidly' of the New England men in 'Church administration' and 'discipline,' see the interesting details in Ezra Stiles' Diary, ed. 1774, 495, 594.

Pressing to extremes in both matters, as followers will, the 'Edwardsians' or 'New Divinity' men became a ferment in the churches of New England, and their influence was disturbing everywhere, gradually won their way to dominance. Meanwhile their doctrinal teaching was continually suffering change. As Fisher (p. 7) puts it, 'in the beginning defending the established faith, they were led to re-establish it in new forms and to change its aspect.' Only, it was not merely the form and aspect of their inherited faith, but its substance, that they were ever transforming. Accordingly, Fisher proceeds to explain that what on this side constituted their common character was not so much a common doctrine as a common method: the fact that their views were the result of independent reflection, and were maintained on philosophical grounds. Here, too, they were followers of Edwards; but in their exaggeration of his rational method, without his solid grounding in the history of thought, they lost continuity with the past and became the creators of a 'New England theology' which it is only right frankly to describe as provincial.6

The men who worked out this theological transmutation were men of great energy, as great in the use of energy as of their energy of thought, and what may almost he called fatal logical acuity. And it would be proud to report as a virtue of that work, in the course of a century such a series of 'strong reasoners' on religious themes as Joseph Bellamy (1719-1790), Samuel Hopkins (1729-1805), Stephen West (1750-1813), John Smalley (1728-1820), Jonathan Edwards, Jr. (1745-1800), Nathaniel Emmons (1745-1840), Timothy Dwight (1749-1817), William Whiston (1762-1842) and Nathaniel W. Taylor (1786-1858)—all, with the single exception of the younger Edwards, graduates of Yale College; not to speak of yet others of equal power, being mere off the line of direct development, like Leonard Woods (1774-1854), Bennet Taylor (1785-1862), Edward H. Griffin (1779-1827), Moses Stuart (1790-1832), Lyman Breecher (1775-1860), Charles G. Finney (1792-1875), Leonard Bacon (1802-1852), Horace Bushnell (1802-1876), and Eleazar A. Park (1808-1900). It is a far cry from Jonathan Edwards the Calvinist, defending with all the force of his unsurpassed reasoning powers the doctrine of a determined will, and communing with the theological virtue which identified it with general benevolence, to Nathaniel W. Taylor the Pelagianizer, building his system upon the doctrine of the power to the contrary as its foundation stone, and reducing all virtue to essentially self-love. Taylor's teaching, in point of fact, was, in many respects the exact antipodes of Edwards', and very fairly reproduced the congeries of tendencies which the matter combined it his life-work. Yet Taylor looked upon himself as an 'Edwardsian,' though in him the outcome of the long development received its first appropriate designation— the 'New Haven Divinity.' Its several successive phases were bound together by the no doubt external circumstance that they were taught in general by men who had received their training at New Haven.

The growth of the New Divinity to that dominance in the theological thought of New England from which it derives its claim to be called 'the New England Theology' was gradual, though somewhat rapid. Samuel Hopkins tells us that at the beginning—in 1766—there were not more than four or five who espoused the sentiments which since have been called 'Edwardsian' and 'New Divinity'; and since, after some improvement was made upon them, 'Hoppokianism' or 'Hopkimsonian sentiments.' The younger Edwards still spoke of them in 1777 as a small party. In 1787, Ezra Stiles, chafing under their growing influence and marking the increasing divergence of views among themselves, fancied he saw their end approaching.

2 Park, The Life of Hopkins, Boston, 1834, p. 23; Fisher, Discourses, etc., 80.
3 Ezra Stiles, ii. 527; Fisher, loc. cit.
It has been the Ten," he writes, "to direct Students of divinity these thirty years past or a generation to read the Bible, President Edwards', Dr. Bellamy's, and Mr. Hopkins' writings, and that was a good succession of reading. But now, 'the New Divinity gentlemen are getting into confusion and their own younger circle,' but yet in full vigor, suppose we see further than those Oracles, and are disposed to become Oracles themselves, and with Dr. Edwards and their offspring come into vogue. He thought these 'confusions' the beginning of the end.

In this he was mistaken: the New Divinity, in the person of Timothy Dwight, succeeded him as President of Yale College, and through a long series of years was infused into generation after generation of students. The 'confusions' Stiles observed were, however, real; or, rather, the progressive giving way of the so-called Edwardsians to those tendencies to thought to which they were originally set in opposition.

We note Hopkins already conscious of divergence from Edwards' teaching—a divergence which he calls an 'improvement' in Theology, and that which he was beginning to 'deny a real vicarious Suffering in Christ's Atonement,' and were 'generally giving up the Doctrine of Imputation both in Original Sin and in Justification'; and of some of them, 'receding from disinterested Benevolence, are giving themselves to the practice of it as terminating in personal happiness,'—"a very fair statement of the actual drift.

The Younger Edwards drew up a careful account of what he deemed the (ten) 'Improvements in Theology made by President Edwards and those who have followed his course of thought.' Three of the most cardinal of these he does not pretend were introduced by Edwards, attributing them simply to those whom he calls Edwards' 'followers.' These are the substitution of the Governmental (Grotian) for the Satisfaction doctrine of the Atonement, the 'a priori' view of which he himself, with partial forerunners in Bellamy and West, was the chief agent; the discarding of the doctrine of the imputation of sin in favour of the view that men are condemned for their own personal sin only—a contention which was made in an extreme form by Nathaniel Emmons, who confined all moral quality to acts of volition, and afterwards became a leading element in Nathaniel W. Taylor's system; and the perversion of Edwards' distinction between 'natural' and 'moral' inability so as to ground on the 'natural' ability of the regenerate, after the fashion introduced by Dwight. The history of the capacities and duties of men without the Spirit, which afterwards, in the hands of Nathaniel W. Taylor, became the core of a new Pelagianizing system.

The external victory of the New Divinity in New England was marked doubly by the election of Timothy Dwight to the Presidency of Yale College (1797); and certainly it could have found no one better fitted to commend it to moderate men; probably no written system of theology has ever enjoyed wider acceptance than Dwight's Sermons. But after Dwight came Taylor, and in the teaching of the latter the downward movement of the New Divinity ran out into a system which turned, as on its hinge, upon the Pelagianizing doctrines of the native sinlessness of the race, the plenary ability of the sinner to renovate his own soul, and the idea of the desire for happiness as the spring of all voluntary action. From this extreme some reaction was inevitable, and the history of the so-called 'New England Theology' closes with the moderate reaction of the teaching of Edwards A. Park.

The theological descent which came through Hopkins, Emmons, and Woods; but he sought to incorporate into his system all that seemed to him to be the results of New England thinking for the century which preceded him, not excluding the extreme positions of Taylor himself. Reverting so far from Taylor as to return to perhaps a somewhat more determinative doctrine of the will, he was able to rise above Taylor in his doctrines of election and regeneration, and to give the general type of thought which he represented a sense of life for another generation. But, with the death of Park in 1800, the history of 'New England Theology' seems to come to an end.

LITERATURE. (A) A list of Edwards' works is given by Dwight, L. 765 ff.; S. Miller, 254 ff., and Riddlebro, 327 ff. (op. cit. infra). A brief bibliography of Dwight, etc., p. 254, 1855.

BENJAMIN B. WARFIELD

EGO (a term [Lat. 1st personal pronoun 'I'] for 'self'; used in various languages) of the Ego is very perplexing. It is difficult to describe its content, and to discover a fundamental principle which will serve to distinguish it satisfactorily from the non-Ego. If, starting from its etymology, we say an Ego is a conscious being, one who knows himself and is able to say 'I,' and proceed to ask what the Ego so defined is, we get different answers. Descartes called it a
Thinking thing,' including, under the term 'thinking,' understanding, affirming, denying, willing, refusing, imagining, perceiving (Meditation II.). Thinking is a quality in qualities inhering in substances; for it cannot be that a quality is a quality of nothing. By substance is meant a thing existing in such a way as to stand in need of nothing else in order to its existence" (Principles, § 4). Everything is by definition independent of being, namely, God. A finite mind, however, is dependent on nothing but the 'concurrency of God.' It is not dependent on body; for, Descartes concludes, there can be no thought when the existence of body is doubted; and it does not need a place in order that it may exist. Its existence is involved in thinking—'as long as I think, I am' (Med. II.). Yet Descartes has to recognize that his two mental substances are so intimately related in man that some of the experiences of the Ego—pain, hunger, thirst, etc., which he calls confused modes of thinking—arise from this union. He thus turns to anal.

An examination of the content of self-consciousness, however, shows that the line drawn between the self and the not-self is not always drawn by Egos themselves in the way Descartes draws it. At all events, much of our intimate existence is from our conception of ourselves. We identify ourselves, e.g., with what we want to be, with the ideals we have taken as our own. When we forget these and act on other motives, we say that we have forgotten ourselves. At other times the body and even objects outside the body are included in the conception of self.

'Between what we call me and what he simply calls me the line is difficult to draw. We feel and act about certain things that are ours very much as we feel and act about our bodies, and yet they are not part of our hands, may be as dear to us as our bodies are, and arouse the same feelings and the same acts of repulsion if attacked. And our bodies themselves, are they simply ours, or are they me? Certainly men have been known to disown their very bodies, and to regard them as mere vestures, or even as prisons of clay from which they should some day be glad to escape.

'Ve see, then, that dealing with a fluctuating material, the same object being sometimes treated as a part of me, at other times as simply mine, and then again as if I had nothing to do with it at all. In its widest possible sense, however, a man's in the sum-total of all that he can call his, not only his body and clothes, his house, his home, his family, his wife and children, his ancestors and friends, his reputation and works, his lands and horses, and yacht and bank account. All things united in man.'

Philosophical reflection seems to confirm the conclusion from a psychological analysis of the content of self-consciousness. The self cannot be separated from what it knows, feels, and reacts upon, without being destroyed. If it knew nothing of the world, it would certainly be empty of content. It lives and grows by the dual process of appropriating all things related to it, and at once distinguishing itself from them. Its nature, as MacDougall expresses it, is very paradoxical.

'What does it include?' he asks. 'Everything of which it is conscious. What does it exclude? Equally—everything of which it is unconscious. What is it that we call it inside us? Nothing. What can it say nor is not outside it? A single abstraction. And say attempt to remove the paradox destroys the self. For the two sides are logically connected. We cannot make it if we think individual by separating it from all other things, it loses all content of which it can be conscious, and so loses the very individuality which we started by trying to preserve. If, on the other hand, we try to save its content by emphasizing the exclusion at the expense of the connection of the consciousness vanishes, and, since the self has no contents but the objects of which it is conscious, its contents vanish also. (Studies in Hegelian Cosmology, 1903, p. 27.)

Descartes' assertion that the Ego, as we know it now, is a thinking substance independent of its own and other's existence cannot therefore be justified by an appeal to immediate consciousness, psychological analysis, or philosophical reflection. That after death other objects take the place of bodies may, of course, be quite possible. But dependent relation to objects seems an inexplicable element of it. Whatever may be the true nature of themselves substantial existence is a question which will concern us again. At present we have to consider the question whether the Ego can be intelligibly called a substance. Substance is only Descartes as that in which qualities inheres. It is, in Locke's words, their 'unknown support.' We do not know, Locke says, what a substance is. It cannot be perceived by the outer or inner sense. There is nothing which can give no intelligible account of its relation to the qualities which it is supposed to support. Hence, to say that qualities inheres in substances is, according to Locke, to say nothing more than that they exist together. Why then, assume the existence of substances? Berkeley, following after Locke, asked this question regarding material substance, and denied its existence. Hume asked it of mental substance, and denied the existence of the Ego.

'...I have no immediate intimation of [matter],'' said Berkeley; '...we can be immediately from our sensations, ideas, notions, actions, or passions infer an unthinking, unperceiving, inactive Substance—either by probable deduction, or necessary consequence. The idea of Substance is a means of reasoning in our ideas (Third Dialogue between Hylas and Philemon).

'If my parents are dead, why, then, do I not call myself?' says Hume, 'when I live solely in what I call myself, I always stumble on some particular perception or other, of heat, cold, light, shade, love or hatred, pain or pleasure. If I step into water, I cannot perceive it, and never can observe anything but the perception.' A mind 'is nothing but a bundle or collection of different perceptions, which succeed each other with an inconceivable rapidity, and are in a perpetual flux and movement' (Human Nature, bk. i, sec. 6).

'The final result of Hume's reasoning,' says Huxley, 'comes to this: As we use the name body for the sum of the phenomena which make up our personal existence, so we employ the name of soul for the sum of the phenomena which constitute our mental existence; and we have no more reason, in the latter case, than in the former, to suppose that there is anything beyond the phenomena which answers to the name. In the case of the soul, the idea of substance is a mere fiction of the imagination. This conclusion is nothing but a rigorous application of Berkeley's reasoning concerning matter and mind, and it is fully adopted by Kant.'

'The last quotation represents Huxley's own opinion also. The individual mind is held to be a series of mental phenomena parallel with the series of material phenomena which compose the corresponding individual body. The series do not interact. In place of Descartes' dualism of substances we have a dualism of mental phenomena. (For an adverse criticism of this theory, see J. Ward, Naturalism and Agnosticism, 1903, vol. ii. pt. iii.; and McDougall, Body and Mind, 1911, ch. xiii.)

'Reflexion on Descartes' conception of substance led Spinoza also to deny the substantial existence of the Ego. His method was different from that of the English Empiricists. Emphasizing the idea that substance is conceived through itself and exists in itself, he concluded that there is only one Substance—God. Minds and bodies are but modes of its two attributes—thought and extension—respectively (Ethics, ii. prop. 10).

'The substantial nature of the Ego has been maintained by other thinkers holding more adequate notions of substance than that held by Descartes. The universe, according to Leibniz, consists entirely of indivisible, mutually exclusive substances, or 'monads,' as he calls them. The content of these monads consists of their perception of the universe. They differ according to their content of view to the clarity of their perceptions. The rank of a monad in the scale of being depends on the clarity of its perception, on the degree of adequacy with which it mirrors or reflects the universe. What appears to us as inert matter is an

fundamental described, form Leibniz or the
constituents of the universe consists of Egos. They are not mutually exclusive, as with-Leibniz. They are related to one another through inclusion in the one absolute Person, God. God is the only absolute Substance, but finite Egos have relative independence. They are not mere modes of the being of another, or of others, as material things are. The latter do not exist in themselves, because they do not exist for themselves. Only beings that exist for themselves have self-existence. What is essential for self-existence is feeling. Thought is not essential, although it is necessary in order to develop the full meaning of selfhood, to enable an Ego to know itself and to say 'I.' But whatever has a feeling of self, and is, e.g., a human being, has that fundamental characteristic on which substantial or self existence depends. For it 'undoubtedly distinguishes its own suffering from the rest of the world, though it can understand neither its own Ego nor the nature of the external world' (Microcosmus, Eng. tr., 1885, vol. I. bk. ii. ch. v. § 3). J. Ward develops a theory along lines suggested by Leibniz and Lotze (cf. his Realm of Ende, Cambridge, 1911, passim).

We have so far discussed the term 'Ego' as applied to the complete conscious individual, or to what psychologists call the 'total self.' But it has another application which is important. Since Kant wrote, many have recognized within the Ego so conceived a duality, variously described as a duality of subject and object, of subject-consciousness and object-consciousness, of the 'I' and the 'Me,' of the pure Ego and the empirical Ego—not a dualism of essentially different substances, but one understood, but a duality of such a nature as to form together one individual conscious being.

But of perceptions and sensations, a 'bundle of perceptions' or a 'sum of phenomena,' are capable of being analyzed, described, and related to one another. They are constituents of the Ego as object-consciousness, the Me, to speak in Leibniz's phrase, the only constituents of the object Ego. As already noted, a line cannot be drawn between what is included in the Ego and what is not. The body is often included by a man in his consciousness of himself, and even objects outside the body. A mystic may feel at one with the universe, or consciously identify himself with God.

But distinct from the self as known and possessed is the self or subject which knows and possesses it. Knowing implies two terms in relation. An idea or perception which is perceived by no one is a contradiction. The centrality and organization of experience is unintelligible apart from the synthetic act of an interested subject (Ward).

Simple ideas are not combined into complex ideas by mere association; a combination is necessary (James). The bundle of perceptions' or a 'sum of phenomena,' cannot know itself as a bundle or sum respectively. How is that which is, ex hypothesi, a series to know itself as a series? (J. S. Mill), experience is not a mere series of perceptions. It is a unity.

That the different kinds of empirical consciousness must be connected in one self-consciousness is the very first and synthetical foundation of all our thinking, whether of ourselves as individuals or of the world as systematically connected according to law. And the unity of self-consciousness depends on the synthetic activity of the Ego, the 'I think,' which accompanies each of its synthetic acts.

In Kant's philosophy three Egos may be distinguished—the pure Ego (the subject of knowledge), the empirical Ego (the succession of our conscious states), Hume's flux of perception, and the noumenal Ego (the subject of moral action). The first is needed to account for the objective unity and necessity of knowledge; the second is a verifiable fact; the third is postulated to make morality possible. The logical principle, and the source of all theoretical principles; the empirical Ego is a part of the order of Nature, and all its states are determined according to the scientific law of causation which, with other theoretical Egos, has its source in the pure Ego. The noumenal Ego does not belong to the world of sense, and is not subject to the order of Nature; it is free, and must be so if morality is to be possible. For morality implies the categorical imperative 'Thou oughtest,' and 'ought' implies 'can.' The categorical imperative is a command of the Practical Reason, or of reason in its practical application. Hence the freedom of the Ego is a postulate of the Practical Reason. And, since freedom is impossible in a world determined throughout according to the law of causation, as the world of sense-experience is thought by Kant to be, the ethical Ego belongs to the noumenal or intelligible world—a world which transcends the phenomenal. The ethical Ego is the same as the logical Ego, but its transcendent existence can be asserted only by the Practical Reason. For the theoretical reason the Ego is an utterly empty idea. Nothing more can be said about it than that it is self-consciousness in general, the bare form of consciousness—the 'I think' which accompanies every knowledge—within which is the possibility of the knowledge of objects, but which has itself no content to distinguish it, and is not separable from the consciousness of objects. One obvious objection to Kant's conception of the Ego in its logical and ethical form is that it is too abstract to account for the concrete unity and organization of experience. Sentience is excluded from it. Perceptions and sense-impulses must be assumed as somehow given. Kant made this assumption at first. He saw later that synthesis was implied in simple apprehension. But the conception of the Ego was not modified by him. He did much to overcome the opposition to the Ego, and sensibility and reason which had been developed by previous thinkers. One of his main purposes was to show that both were necessary for knowledge. But the dualism persists in his philosophy as two elements of opposite nature that had to be brought together. Later thinkers have carried out more thoroughly what Kant attempted. J. Ward maintains that the subject of sense-ex,

1. Cf. Deussen, The Philosophy of the Upanishads, Eng. tr., Edit. 1906, p. 39: Brashman, the 'eternal infinite divine power is identical with their sum, with that which after stripping off everything external, we discover in ourselves as our real most essential being, our individual self, the soul. This identity of the Brashman and the Atman, ... is the ultimate metaphysical thought of the entire doctrine of the Upanishads. It is briefly expressed by the later Hindu art thought 'I am Brashman.' To know self as Brashman is to achieve salvation.

4. Examination of the Hypothesis of a Mind, Philosophy, 1877, p. 248.

7. Critique of the Practical Reason, Abbot's tr., 1879, p. 121 f.

experience is one and continuous with the subject of knowledge. So also the subject of simple impulsive actions is one and continuous with that of purposive actions.

Because experience at all levels depends on active as well as on passive factors, and because the conception of an object without a subject is a contradiction, Ward believes that the duality of subject and object in unity is a fundamental and un-derivable reflective character, present alike in cognition, sensation, and feeling. It is true even of the experience of God—the Supreme Person. Other thinkers who recognize that experience shows this duality deny its fundamental character. Bradley, e.g., says that the distinction is derivative. There is no ground for asserting that it is true of experience at all levels—the highest and the lowest. The consciousness of activity is not primary. The perception of activity comes from the expansion of the self against the not-self. There is no consciousness of activity as distinguished from mere change apart from the idea of change. Moreover, subject and object have contents and are actual psychical groups. The contents of subject and object are interchangeable. Ideally, every conation and the most inner feelings may be made objects; we can, e.g., that the 'leaf of dung' of George Berkeley, *The Immortality of the Soul*, 1879, chs. ix. and x.; cf. also A. E. Taylor, *Elements of Metaphysics*, 1908, bk. iv. ch. iii.

Ward replies that Bradley confounds reality with experience. It is easy to agree with a reflective knowledge of it. The relation subject-object must exist before it can be perceived. To show how the idea of activity arose is not to show that the consciousness of activity itself is derivative. There is no evidence that the subject of the object, and is presupposed in the perception of it. The relation subject-object cannot be reduced to relation between presentations.

The strongest objection to Ward's theory is that based on the ability of the mind to reflect on its own conations and feelings, thus apparently transferring them to the object Ego. But a subject, it is argued, is identical with its own perceptions in its reflection. True. Is it, however, the same object? May there not be several Egos? W. James maintains that this is the case.

In the statement, 'I may represent as a stream, things which are known together are known in simple pulses of that stream. The pulse of the present moment is the real subject. It is enduring being; the subject lasts for a moment; its place is immediately taken by another which experiences only that which it is to act as the medium of unity. The subject for the time being knows and adopts its predecessors, and by so doing appropriates what its predecessors adopted,' it is this trick which the nascent thought has of immediately taking up the aspiring thought and adopting it which leads to the appropriation of most of the remainder constituents of the self. Who owns the last self owns the self before the last, for what possesses the possessed possesses the possessed' (*Text-book of Psychology*, 1903). 'If there were no passing states of consciousness, then indeed we might suppose an adding principle absolutely one with itself to be the consciousness thinker in each one of us. But, if states of consciousness be accorded as realities, no such 'substantial' identity of the thinker need be supposed. Yesterday's and today's states of consciousness have no substantial identity. For when one is here the other is irreversibly dead and gone. But they have a functional identity, for both know the same objects, and so far as the by-gone me is one of those objects they react upon it in an identical way. It is it and opposing it to it and opposing it to all the other things they know. This functional identity seems really the only sort of identity in the thinker which the facts require us to suppose. Successive thinkers numerically distinct, but all aware of the same past in the same way, form and share an identity as for all the experiences of personal unity and sameness which we actually have. And just such a stream of successive thinkers is the stream of mental states ...' (ib. 2011).

This theory is not open to the objection made to that of Ward. But another difficulty presents itself when we consider the relation between the Egos. Assuming that the present pulse of the stream is able to exercise all the functions attributed to the Ego at any moment, the question arises, How are we to account for its special characteristics, and for the selection made out of the total complex presented at any moment, and thus account for the concrete unity or unities then manifested? The present Ego, according to the account given, is not derived from its predecessors; it does not 'inherit' the past, but possesses it by an act of appropriation. An Ego is not continued in its successor, for it has no substantial identity with it. Each Ego is described as an isolated individual, which appears for a moment as a medium of unity, and then vanishes, leaving its complex object and conative and reactive accompaniments—why have these not vanished—to be appropriated by another, and this in turn gives place to still another which appropriates it.

Does this theory enable us to understand the relative permanence and unity of experience? Perhaps we should not take James's words too literally when he says that there is no substantial identity between yesterday's and to-day's states of consciousness. The words 'substantial' and 'identical' are ambiguous. James is here refuting the theory that the Ego is a stage of consciousness, which exists independently of what it knows, and remains one and the same over against the flux of experience. But his statements do not simply deny such a subject. They affirm also that the successive subjects are different beings, and that there is no continuity of existence between them; when one is here the other is irrecoverably dead and gone. That the past conditions the present subject, he would not assert: he says there is no identity between past and present states? And how can a past state which is irrecoverably dead and gone be known and welcomed by the subject as its own?

James seems to make too much of his metaphor. A stream is not adequate to represent conscious life. It emphasizes its contingency, and over-emphasizes its transitoriness. Our experience contains relatively permanent elements. The past endures in the present. A state of consciousness is not a momentary existence merely. As a passing phase, of course, it endures only for a moment. But its whole being is summed up in the passing phase. Experience is process; so is all else. *All things flow.* No state of the existence of a tree or stone ever, as such, recurs. But the stone or the tree does not cease to exist, and every moment it has assumed shows itself in a more or less permanent modification of being. A subject which knows a tree as an enduring thing must itself be a relatively permanent being.

But we are not obliged to attribute absolute unchanging permanence to the subject, and define it as a simple indivisible principle or entity. It must have at least as much concreteness and variety of character and as much complexity of structure, so to speak, as its objects. Moreover, the character of the Ego is a changing one. The fabric or material of experience is undergoing frequent transformation, and we cannot but suppose that the Ego is similarly transformed. Indeed, it is obvious that our capacity for knowing, feeling, and doing is being continually modified. What appeals to us and compels attention, what we choose and reject, our conception of the world and our estimation of the things we do change from day to day. The unity and identity of the subject cannot, therefore, exclude change. Why should a simple and indivisible element be asserted to exist in us? Perhaps the motive is that we are not demanded to fix Ego characteristics quite opposite to those.
Egoism

—from G. E. Moore, “Some Refutations of Subjective Idealism,” Mind, 1903

Egoism.—A distinction may be drawn between theoretical and practical egoism. (a) Theoretical egoism, usually called Subjective Idealism or Self-Centeredism, is the theory which maintains that the

mind to life = mere selfishness. A man is usually called egoistic or egoist in so far as his inclinations and purposes are immediately and exclusively directed towards himself (cf. Meredith's Egoist). Such egoism may be independent of any theory as to what is right and what is reasonable. It may be taught by a child or by a thoughtless man; and may take the form of choosing what is most agreeable or least painful at the time, without any thought of life as a whole. On the whole, it may be the result of cool deliberation and concentrated purpose. Thoroughgoing egoism of this kind is seldom or never met with. 'Selfishness' is not, indeed, a logical consequence of ethical egoism. It is not inconsistent with the latter to cultivate a 'disinterested' regard for others and for their welfare. For too great and direct regard for self-interest may lead to a narrowing of the scope of life which is incompatible with the greatest individual well-being. The hedonistic egoist who seeks his own happiness too keenly is in danger of defeating his own end.1 A man concerned to save his soul may attain his end most effectively by trying to save another's, and by former efforts a man has a soul to save; losing interest in himself, he finds himself. By dying he lives. Hence Ethical Egoism, or Egoism as a theory of the good or of what is right and reasonable, does not necessarily imply 'selfishness.'

Ethical egoists are generally dogmatists; i.e., they do not seek to justify the individual's right to make his own good the standard of life, or, in other words, to show that such a view is a reasonable one for him to take. Such justification is not, perhaps, thought to be necessary. The reasonableness of seeking our own good is taken granted. A reason is sought only to be needed for considering the good of others when inclination does not induce, or necessarily compel, a man to do so. Even Butler says 'that our ideas of happiness and misery are of all our ideas the nearest and most important to us ... that, though virtues or moral rectitude does indeed consist in affection to and pursuit of what is right and good, as much; yet, when we sit down in a cool hour, we can neither justify to ourselves this or any other pursuit, till we are convinced that it will be for our happiness, or at least not contrary to it' (Sermon xi).

That the egoist should seek his own good as one of his ends requires no justification. It is simply an extension of the appeal for his own good is to each one immediate, and it is intuitively evident that he should seek it. The appeal of the good of others is not so direct; nor is it so intense as the egoist evidences. He does not feel that he can promote it except when others are bound to him by such intimate ties as make their welfare interesting to him in the same way as his own. Consequently, when, from any cause, natural and social claims are weak or repudiated, egoistic theories of life tend to win recognition. The Cynics, e.g., lived during the decline of the Greek city-state, and Hobbes (1688-1679) during the social disorganization attending the Revolution in England. Spinoza was ostracized for his theological views; Schopenhauer and Nietzsche were constitutionally Islametees.

Egoism is based, explicitly or implicitly, on an 'atomistic' conception of society; every social whole is composed of individuals, the nature of each one of whom is to preserve his own life, to seek his own ends. This is the same as to satiate his own desires; and good and evil are relative to the individual. There is nothing good or evil absolutely. Both presuppositions are explicit in Hobbes.

1 See also W. E. Midgley, Methods of Ethics, 1893, p. 99.

EGOISM

Buddhist)

egoism is based on psychological egoism. For men aim consistently at their own good, to the extent that they have the virtue of self-control and of the nature of the good which will satisfy them. Ethics is the systematic study of this good; and its teaching will acquire scientific exactness only when the nature of the individual man in relation to his outside and the rest of the universe is clearly understood.

If the egoist's attitude is dogmatic, his ethics is fundamentally merely a statement of his own convictions, and cannot be regarded as a means of testing the truth. But when he tries to justify his conviction, he may be reasoned with, and, possibly, convinced of error. The egoist is trying to give a reasonable basis to his theory when he rests it on a psychological analysis of the nature of desire. His attempt is, as we have seen, not successful. He might yet maintain that he has an immediate and ultimate intuition that he should seek his own good whether he actually does or not. It may be safely said, in reply to this, that other men would not recognize the validity of the egoist's intuition, especially if his good is to be obtained at their expense.

Further, he ought consistently to admit that every other individual's good is an ultimate good for himself, and that it should be recognized as such by all. And, if this be admitted, does it not follow that the good of all should be respected by each, and that, therefore, a social contract is to be set up between egoists? The egoist's contention would then be qualified into the statement that he should seek his own good, but in such a way as not to interfere with similar self-seeking on the part of others.

Further, it may be urged that the atomistic conception of human life is false. Human societies are not mere aggregates. A man is not self-contained; no sharp line of division can be drawn between his life and interests and those of others (cf. art. Ego). He is a member of an organic whole. The complete good is the good of the whole of which he is a member. The full realization of his interests is at the same time the full realization of the interests of others. Hence his good is not a purely private and personal matter. It is true that sometimes there is an appearance of conflict. Whether the conflict is necessary is a large question which cannot be discussed here. In an ideal state, as H. Spencer (Data of Ethics, 1879, ch. xi.) points out, there would be no conflict. And even now men exist who seem to find that they more nearly realize their true good by renouncing what appears to be necessary and acting for the sake of others. They so identify themselves with their State or Church that they are content to die in order that the institution may live and flourish. If the surrender of life is not felt to be self-sacrifice but self-realization, and it is often made with no thought of recompense in a future life.

DAVID PHILLIPS.

EGOISM (Buddhist).—The inquiry whether the motives, sources, or springs of action are or are not exclusively egoistic, or self-interested, whether or not 'altruism' may rank as a twin in such springs, or whether there are yet other sources, is so characteristic of modern ethics that it appears of no importance whether a corresponding conception be found in early Buddhism, any more than in other early philosophical and religious traditions. Such discussions are the corollaries of a synthesis which belongs
more essentially to the past two centuries than to any others we can name that of individuals and of peoples as solidares one of another. They have sprung from a time, when, in George Elliot's words, "ideas were making fresh armies of themselves, and the universal kinship was a sense of the common pulsa when the soul of man was waking to pulses which had for centuries been beating in him unheared, until their full sun made a new life of terror or of joy" (Daniel Deronda).

Herein possibly lies a sounder basis of historical division in ethical theory than, with Martineau, to carry a psychological basis the tru dichotomizing principle of the ethical systems of pre-Christian and post-Christian thought. His generalization is sound only as long as we turn our head on not only one part of pre-Christian ethical thought, but on by far the most considerable part. In his strange statement, 'It is curious that psychological ethics are altogether peculiar to Christians' (italics his), the whole world of Oriental thought is ignored. To take India only: in Vedântist ethics, the ethical ideal, growing up with the evolution of thought, is emphatically subjective. The creative and presiding power of the universe is identified with the psychic principle in man; salvation lay in the personal recognition of this identity—'the finding self to be Atman' (Deussen)1; and the ethical value of actions was reckoned by their objective scale of utility than according to a subjective calculus of their significance, in cost and result, to the doer.2 Buddhist ethic is no less strongly and consciously psychological (see Desire [Buddhist]). Its views on the self were different from those of Vedântism. It denied any immanence, in the wholly and constantly changing living organism, physical and mental, of an eternal, unchanging, impassive (i.e. super-psychic) principle. The psychic agency was a convenient abstraction of thought, a convention of popular speech, as when we say 'it rains.' As a metaphysical, rather than an ethical, subject, but one of cardinal importance in Buddhist doctrine, the ego is dealt with under Self, Soul. Under the present title we are concerned with the attitude of its ethical doctrine towards that which, in theory or practice, is called 'egoism.' All the materials, in fact, for our modern ethical discussion of egoism and altruism are present in Buddhism; and, since the sources of those materials are still so imperfectly accessible, and so inadequately explained, it is hoped that we may yet discover, or come upon, such discussion.3 We may nevertheless affirm this much: that it forms no such predominant feature as is the case in modern ethical works. It is as if the pulses of that full and rich operation to which we have referred above were beating latent and unheard. The struggle of early culture was for the individual to 'find himself,' even as it is to-day. The intervening struggle has been to find one's brother.

1. We find in the Pâli Pitakas a definite theory with respect to the 'springs of action.' These are termed kàta (condition), kàsa (cause), or mîsa (root), or pátha (result). They are classified in number three being 'roots' of good, three of bad action.

And, though bad and good actions are so termed in virtue of the painful or pleasurable results they entail respectively on the agent, yet they are shown actually to consist in immoral and moral actions respectively—that is to say, in actions conceived as detached, love, and intelligence. In Pâli they read lobha, dosa, mîsa; akûhà, adosa, anûha. A frequent synonym for the first is rêga ('lust,' 'passion,' understood very generally); for the third, avijjà ('ignorance'); for the fifth, mîta ('love,' 'charity,' 'animity'); for the sixth, pâtta ('insight,' 'wisdom'). So radical and inclusive, as sources of all human faults and follies and consequent suffering, are the first three held to be, that the extinction of them, that is to say, letting action proceed solely from their three opposites, is one of the few positive definitions given of nibbàna (nirvàna [q.v.]).

No reduction is attempted of either triplet to any more ultimate ground of action. But the first-named of the three is the psychic principle in man: salvation lies in the personal recognition of this identity—'the finding self to be Atman' (Deussen); and the ethical value of actions was reckoned by their objective scale of utility than according to a subjective calculus of their significance, in cost and result, to the doer.2 Buddhist ethic is no less strongly and consciously psychological (see Desire [Buddhist]). Its views on the self were different from those of Vedântism. It denied any immanence, in the wholly and constantly changing living organism, physical and mental, of an eternal, unchanging, impassive (i.e. super-psychic) principle. The psychic agency was a convenient abstraction of thought, a convention of popular speech, as when we say 'it rains.' As a metaphysical, rather than an ethical, subject, but one of cardinal importance in Buddhist doctrine, the ego is dealt with under Self, Soul. Under the present title we are concerned with the attitude of its ethical doctrine towards that which, in theory or practice, is called 'egoism.' All the materials, in fact, for our modern ethical discussion of egoism and altruism are present in Buddhism: and, since the sources of those materials are still so imperfectly accessible, and so inadequately explained, it is hoped that we may yet discover, or come upon, such discussion.3 We may nevertheless affirm this much: that it forms no such predominant feature as is the case in modern ethical works. It is as if the pulses of that full and rich operation to which we have referred above were beating latent and unheard. The struggle of early culture was for the individual to 'find himself,' even as it is to-day. The intervening struggle has been to find one's brother.

In a brief provisional inquiry like the present, the best course suggesting itself is to indicate: (1) the presence in Buddhist scriptures of the materials aforesaid, or, let us say, of channels in ethical thought on the lines of the modern elevation; (2) any modification in that thought due to the a-psychic or anti-animistic standpoint; (3) any evolution in Buddhism with respect to egoistic and altruistic theory.}

1 Martineau, Types of Ethical Theory, Oxford, 1885, i. 14.
As related to moha, lobha, or lusting after false goods and ends, is aided by the errant groping and dim vision, denoted by the former term. Thus the verses ascribed to Mahâpajâpati (aunt and foster-mother of the Buddha) are:

11. 'Let no long wave drown all time,
Not knowing how and what things really were,
But never finding what I needed.
But now mine eyes have seen the Exalted One."
Now have I understood how all things come.

Crowning, the cause, in me is done.

(Therigatha, 157.)

2. Taking next the three causes of good or moral action, it is not possible to reduce them to simpler terms. * Those who understood Comte, the * enlightened * man, thought them at least as ultimate as condition, feeling, and cognition. * Alobha, or detachment, is not so negative as it sounds. Essentially a state of mind and heart which does not grasp at, or clinging to, it is the condition of all generous and disinterested action. * Such a state is likened to free mobility of a dewdrop on the glistening surface of a lotus-leaf. * Adora is sympathy, altruistic tenderness, care, and forbearance, the 6-dharma of St. Paul. * Amoha is the purity of mind affirmed in the foregoing verses. * And one of these three, according to the Pâtthâna, may condition, involve, and lead to the other two—* Because of alobha, [arises] adora, amoha.* etc. (Duka-patthâna, 1; but this is omitted).

We may trace self-interested and other-interested motives in acts conditioned by one or more of these six, but the six are not reducible to the one principle or the other. The good of self and that of others, as the end and means of action, are frequently met with in the Pitakas, but not as basic principles. For instance, the two form part of a fourfold cleavage in classifying human beings:

There are four classes of people in the world: those, namely, who live either for their own good, or for that of others; those who live for the good of others, not for their own good; those who live for their own good only; those who live for the good both of themselves and of others.

Of these four, the first are compared to a charred and rotten log, good for nothing. Of the rest, the self-interested, better is the first; the third, or egoist, is better than the altruist. The fourth, whom H. Sidgwick would have called a universalistic hedonist, is the best of all men, however, we must beware of the explanation of living for, or being concerned with, one's own and others' good shows that we are not dealing with egoists as we should understand them. The class who study their moral duties and do them, or do them not, and seek to extinguish râga, dosa, moha in themselves, do not habitually exhorts others to do the same. Those who study others' good only are such as exhort others to extirpate the conditions of bad acts, while not themselves trying to do so.

A similar distinction is drawn with respect to other modes of ethical endeavour, showing that the Dhamma contained no encouragement for unenlightened, worldly, or sensual self-interest.

Another classification in self and other-regard, occurring several times, is that of persons who inflict pain or hardship on self and their fellowmen. The same fourfold division is followed, but only the doubly negative class is commented. One who is mastered by greed, etc., devices what is injurious to himself, to others. One who has not cleared away the 'five hindrances'—sensual desire, ill will, ignorance, etc.—has too weak insight to know his own good, others' good, or both; he who has cleared them away 'knows what is the good of both even as it really is.' Generally speaking, the balance of ends is stated in such words as the verse, 'He seeketh both his own and others' good.'

2 and in the Buddha's words: 'Contemplating either one's own good, or that of others, or both, is sufficient motive for setting about it strenuously.' But, while the early Buddhists would that morality should be the result of all spiritual growth, and that benevolence was essential to the increase of one's own happiness, he did not, as Sidgwick says of Comte, 'seriously trouble himself to argue with egoism, or to weigh carefully the amount of happiness that might be generally attained by the satisfaction of egoistic propensities duly regulated' (History of Ethics, London, 1889, p. 257). Thus the Buddha is represented as giving ethical advice to questioners perplexed by rival doctrines, as follows:

'Let your verdict not be guided by tradition, precedent, custom, or dialectic. Test the doctrines, each for himself, whether they will conduce to happiness or the reverse. For you know well that the conduct conducive to happiness is the one to do, and conduct that is not so is to be avoided, by intelligence; and that the conduct conducive to sorrow is conditioned by greed, hate, and delusion. These impulses, therefore, the vile, the evil, unclean, unwise, and stupid others to do to the like. These impulses men to avoid doing these things.'

In more detailed exposition of ethical dispositions and conduct, the term nearest to our 'selfishness' is perhaps maccariya. The derivation is from a stem signifying madness or infatuation, but the dominant feature in the disposition so called seems to be meanness, the opposite of magnanimity, a grudging spirit. The content of the term is, however, expounded in part by other terms indicative of a selfish nature, of one that, extending itself to all or its own class:

'Now, Mine is, not another's, and of one that would hinder generosity in others. Another such ancillary term signifies a stigmatic or contracted state with regard to others' needs.'

Other aspects of egoism—self-interest, self-conceit, self-seeking, self-reference—are all represented in Buddhist doctrine. The term sadattha, one's own good, advantage, or interest, is used invariably; we believe, in the farther meaning of an enlightened self-interest, including personal salvation. Thus, in one of the usual descriptions of the elect or perfected, it is said:

'They who are arahants, who have destroyed the intoxicating desire, who have attained the life, have decided that which was to be done, have laid aside the burden, have won their own salvation (ussâyyathan) thus. Such others, says, Mine is, be not another's, and of one that would hinder generosity in others. Another such ancillary term signifies a stigmatic or contracted state with regard to others' needs.'

Self-conceit, or madda, is thus described:

'Conceit at the thought: ‘‘I am the better man’’—‘‘I am as good (as they)’’—‘‘I am lowly’’—all such fancies, overweening vanity, arrogance, pride, flaunting, assumption, desire of the heart for self-advertisement—this is called madda.'

Now, madda was quite incompatible with sadattha. Self-conceit did not arise in the bosom of him who had won his highest gain. As with some phases of evangelical Christianity, so with Buddhism, it was customary for one attaining to the consciousness of salvation to testify to the same. Two disciples thus attaining are related to have waited on the Buddha, and repeated the formula quoted above:

'Lord, he who is arahant, he who has . . . won salvation, who has utterly destroyed the letters of becoming (rebirth), who is by perfect knowledge emancipated, to him it does not occur—'

There is that better than 1, equal to me, inferior to me."

And, they saluting and passing out of the congregation, the latter added, '. . . the highest good,' and the former, '. . . the greatest' (gnosis) they tell of their salvation (atta), but they do not bring in the ego (atta).'
EGOSM (Buddhist)

testify in their talk to this contrast between saintship and self-reference. Ananda comments on Sāriputta’s beauty of expression and dexterity, and asks:

What have you been occupied with to-day? I have been doing apart, practicing phalas, brother, and there arise in me never the thought, “Is it I who attain or I who emerge.”

That is because all egotistic tendencies in the venerable Sāriputta have long been rooted out, responds Ananda.

Not only do we find this unobtrusion of the ego commented, but we also read of the Buddha, when the self had been obtained, did he arrive at the point of that ego to attribute to himself.

The story is told in the Udāna, a little manual of short episodes framing a metrical logion, how the king of Kosala and his wife dissecns the possibly current Védantist text, that the self, the immanent deity, is dearer than all else. It is possible that the metaphysic implied is more in line with that of the Christian text, that shall a man give in exchange for his soul? (Mt 10). Anyhow, the king mentions the conversation to the Buddha, who thereupon replies:

The whole wide world we traverse with our thought, North and south is more dear to each one to Self.

Since are so dear to Self to other men.

The Self, Self, the Self of other men.

The layman hurteth other lives, the sage

In self-restraint protecteth all lives.

He who doth never think “This mine!”

Nor “Others have gotten something,” blitheth thus:

There’s naught for me! no “mineless” (mamattam) being found.

For he hath no cause to suffer grief.

3. The first-named term of these derivatives, ahaṅkāra, undergoes an interesting evolution in Indian thought, but the ethical part it plays is slight. In older (Chāndogya) Upaniṣads, it is equivalent to the ātman, or soul conceived as the immanent Divinity. Put into our metaphysical idiom, the one passage referring to it runs thus:

Under the aspect of a phalas, the sum total of our perceptions is Self, is I-making.

In several later Upaniṣads the term recurs, but in the psychological sense attached to it in the Sākhyā philosophy. That is to say, it is a mental organ, or function, evolved from matter, and mediating between the material and the spiritual, or presenting external experience as so many “intellegibles” to the soul or self. Its occurrence in the Buddha’s system is contained practically to one phrase repeated in a few sutras of two Nikayas.

The meaning of the phrase is invariably that of the older Upaniṣads. It has two slightly varying forms: “mind involved in I-making, mind-making concept (matina),” and “the bias of I-making, mind-making concept.” The context is concerned with the problem of practical philosophy and religion; how, given the recipient organism and the world of its experiences, to attain spiritual freedom, and not to suffer the concept of self-reference to arise. All assumption of a self, soul or ego

(aṭṭa, ahaṅ, as any part of the organism or its impressions, is to be excluded.

It is possible that the function assigned to ahaṅkāra in animistic psychology was contemporous with the foregoing. But there is no allusion to it, as a psychological fallacy or otherwise, in Buddhist psychology.

But anti-egoistical teaching nowhere resolves itself into a positive doctrine of altruism. The solvents applied, in Buddhism, to the animistic creed of immortal, unchanging Divine soul within one body after the other have been described as the destruction of individuality. The object, however, was not expressly the breaking down of spiritual barriers between one individuality and those of its fellow-men. We may, again, apply to the Buddha Sidgwick’s description of Conie’s views (op. cit. p. 257):

A supreme unquestioning self-devotion, in which all personal calculations are suppressed, is an essential feature of his moral ideal.

The self-devotion, however, is not altruistic, but to the highest good, for self and others, as he conceived it: the good that lay in the perfecting and the perfection (and thereby the completion) of life. And this was ultimately a task to be carried out by each man for himself.

No other may accomplish aught for me.

On the other hand, the self is essentially a life in based on other-regarding virtues, and, in all cases where temperament or infirmities did not forbid, in ministering to the spiritual and temporal needs of others. Combined, moreover, with moral conduct and serenity was the altruistic side of the contemplative disciplines, on which considerable emphasis is laid. This consisted in a systematic irradiation or mental sufussion (phar-mas) of other thoughts, starting from one person or group and expanding the range, with love, then pity (or sympathy with sorrow and pain), then sympathy with the happy, finally equanimity, each emotion to be realized as practically elastic to an infinite degree.

Lastly, the rejection by the Buddha of all validity in rank, caste, or birth, as standards of personal value, was conducive to fraternity in general. A discourse on the altruistic duties of the layman has this peroration:

liberality, courtesy, benevolence, unselfishness, under all circumstances and towards all—these qualities are to the world what the lightning is to the rolling thunder.

And the fraternal affection among members of the Order is frequently mentioned.

One of the most elevated and best known of Pīsākan expressions of universal benevolence is that inculcating mother-love to all beings perhaps the finest outburst of altruism in all ancient literature:

Even as a mother watcheth over her child,

Her only child, as long as life doth last,

So let us, for all creatures, great or small,

Develop each and every being’s heart into a boundless home of love.

Ay, let us practise love for all the world,

Upward, and downward, yonder, hence,

Uncramped, free from ill will and enmity.

Those among modern Buddhists who call themselves Mahāyānists claim that, in developing and progressing the original Buddhist, altruistic sentiment of altruism as opposed to egoism takes a more prominent position in their teaching, notably in what is termed the Bodhisattva (q.v.) theory. Thus the goal of nirvāṇa becomes one not of personal salvation but of transferred
merit, saintly aspiration being for the salvation of all beings. Negatively, writes Daisetz Suzuki, nirvāṇa ‘is the annihilation of [the belief in] the indestructible essence of the individual, the death that arises from this erroneous conception. . . . Its positive side consists in universal love or sympathy for all beings.’

EGOTISM.—See VANTY.

EGYPTIAN RELIGION.—I. CONDITIONS.

1. Length of time.—The very long history of Egypt is traceable through more than 7000 years in writing, and it has a pre-history of which details can be recovered from 1000 or 2000 years before writing; hence the changes of religious thought can be followed over a wider range than in classical lands. In place of a very full account, covering a few centuries, as in Greece and Italy, we have a scattered and fragmentary account of as many thousand years of belief. Therefore, must be very different from that applied to other religions.

2. Character of the land.—The peculiar nature of the country, isolated in the recesses of the desert, as open all to the other interests of man. The continuous contrast of desert and of cultivation impressed the whole Egyptian character. It produced those contrasts which seem so contradictory—a people who had the reputation of gloomy sternness, and who yet covered their tombs with scenes of banquets, dancing, and gaiety: a people to whom the grandeur of the tomb was one of the great objects during life. The constant presence of the dead in the cliffs and desert overlooking the scenes of their lives, or, in later times, more familiarly kept surrounding the family life in the atrium of the house, preserved a sense of the continuity with the Other-world which made a far more contrasted life than we see elsewhere. As opposed to the luxuriance and fatness of the rich plain, there was always visible on either hand the desert, little known, dreaded, the region of malevolent gods, of strange monsters, of blinding, suffocating storms, of parching thirst and heat.

3. Form of the land.—The form of the country also acted on the religion by favouring isolated communities, which produced distinct beliefs. Not only was the long, narrow valley readily cut up into distinct principalities, which warré on one another and promoted separate forms of worship; but there was also that antipathy between the two sections of the population, east and west of the river. To this day a man of one side will dislike those just opposite to him more than those ten times as far away from his own side. The Nile valley not only holds a streak of population a hundred times as long as it is wide, but even two incomparable streaks side by side all the length of it. Thus there was every facility for the isolation of beliefs, for the evolution of its own Creeds, and out their neighbour’s sacred animal was the regular assertion of independence and vigour. Whatever antagonisms we now see remaining beneath the unification of Islam are mere shadows of the intense antagonism between the partisans of rival cults in ancient times.

4. Political rivalry and fusion.—Religion was thus essentially a part of politics. Fanatical fervour is the product of the political necessity of all union. Small bodies, which are liable to be broken up, need a test of true membership, and a moral consciousness that they are in the right and their enemies are in the wrong, foul, miserable, and despicable. All this is given by a religious antipathy of the degree in which the triumph of his followers is his triumph. Hence the mythic victories of the gods, one over another, are the records of the victories of their worshippers; and even the marriages of the gods are occasions of the expression of the marriages of the tribes who upheld them.

Besides the violent conquest of one god or tribe over another, there was the peaceful fusion of tribes, who became blended both in blood and in religion. This led to the fusion of gods who were alike, and who henceforward bore compound names, as Ptah-Sokar-Osiris, or Osiris-Khentamenti. This fusion led to the acceptance of several gods and the uniting of them in groups, triads, or enneads. Thus Horus was originally an independent god, known later as the ‘elder Horus’ or ‘greater Horus,’ son of Hathor, and not as the temple god, from whom Hor—, the dwelling of Horus,’ took her name. Isis ‘was an independent deity she had neither husband nor lover’ (Maspero, Denkbl., 131). Each of the three was compounded of the gods of three independent tribes, Osiris, Isis, and Horus, who were linked as a family when the tribes became fused together.

5. Resulting mixture.—Not only was the theology thus compounded by multiple names for a god, and forming groups of connected gods, but the fusion also led to the acceptance of incompatible beliefs, particularly about the future life. The interaction and combination of these formed a chaotic mass of contradictions, which were continually in flux, and accepted differently by each district, and even each person. There is no such thing as ‘the Egyptian Religion’; during thousands of years there were ever-varying mixtures of theologies and eschatologies in the land.

Such may exist even under the far more exclusive dominance of Christianity. The old Fleish Buche Gediden, or ‘bright spirit,’ is still named among us as ‘Puck,’ while the Buche Dhu, or ‘dark spirit,’ has become the familiar ‘Hogey No.’ If we even retain these in London at present, much more were they realities in the West towards; during years to be considered as totally incompatible with Christianity as one theology in Egypt was incompatible with another; yet here they have co-existed for each other has disappeared since days of Clement. Taken in the order of age, the materials may be classified, with the chief modern publications, thus:

4. NAMES OF PERSONS, SHOWING THE USUAL GODS AND IDEAS: same sources as for ‘Titles.’

6. TEMPLE SCENES OF RELIGIOUS SERVICE, AND TEMPLE
III. POPULAR RELIGION.—7. Pre-historic figures.—The popular religion is the earliest form that we can trace in the remains of the pre-historic ages. In the graves and town-rums are found various animal figures which seem to show the adoration of different species. The human figures of the same age seem to be distinctly servitors to satisfy the wants of the dead, and not to represent higher beings. The lion is the most usual of such animals, and the figures are distinguished from those of later ages by the tail turning up the back, with a small hook at the end. The bull's head was often carved, but rather of a small size, as an amulet. The sphinx—human body and animal head—represented the pharaonic or Graecyptish form. Dr. Erman, Egyy Religion, Eng. tr., London, 1897, pp. 318-327.

8. Magic.—Magic apparently began in the pre-historic age. A small box was found containing three little flat carvings in slate tied together, and two carved ivory tusks, none of which had any use for work. Such ivory tusks were carved with a human head at the pointed end, and kept in pairs, one solid, one hollow. They are probably connected with the present African belief in charming a man's soul into a tusk. Many small amulets were in use—not only the figures of sacred animals, but also such as a fly, a cat, a slave, or a horse.

In the early historic age magic appears as the basis of the popular tales: the forming of a crocodile of wax and then throwing it into the water to pursue a victim; the bringing together the head and body of a decapitated goat and restoring it to life; the turning back of the waters and descending to the river-bed to find a lost jewel—such are the pivots of the earliest tales. There appear to have been at this period a belief in the virtue of words: a word coined to the word the Creator, as among the Hebrews and other nations and languages, having given the word without a name the power to exist. In the case of Moses there is a protest against its translation into Greek: 'out of the solemn, strong, energetic speech of names . . . we do not use words, but we use sounds full filled with deeds.' In the later magic writings and inscriptions, names—generally corrupted and mistaken—are the magic power expressed. In Ptolemaic times a conspiracy turned upon making wax figures, and sending them into the harim, to compass the death of the king. The latest tales, of the 19th century, are not different upon the use of magic. It seems not too much to say that an Egyptian was dominated throughout his life by the belief in the magical control exercised upon the gods, upon spirits in life and in death, and upon material objects. Cf. MAGIC (Egypt.).

9. Domestic worship.—The customs of domestic worship can only be gleaned from some occasional remains. In the pre-historic age the larger disks, carved with a coiled serpent, are pierced with a hole for suspension, showing that they were probably hung up in the houses; and in the 1st dynasty the usual border to the heath was a potter's fender in the form of a serpent, doublet, and serpent sculptured from the clay, or at dawn covered with ashes for the sake of warmth. In the XVIIIth dynasty there was usually a recess in the hall of the house, coloured red; and in one case it is preserved, where it had a scene of adoration of the tree-goddess above it. This was, doubtless, the focus of the domestic worship, probably having different deities painted or it according to the devotion of the master. On reaching Roman times, we have many interesting details preserved by the terra-cotta figures which were then so widely developed. The domestic shrine is represented as a wooden cupboard, a board containing the figure of the household god, with a lamp burning before it. For poorer families, figures were made to hang up by a hole in the back to fit on a nail in the wall. The figure often had at its feet a small lamp, made all in one piece. Such figures are found by the thousand in towns of the Roman age, showing that they were probably in use in every house, or every room, like figures of saints at present among Roman Catholic populations. Of the prayers to the gods there is evidence in the epitaphs of Amen, 'who cometh quickly to him who calls on him;' and of Ptah, 'who hears petitions;' and whose tablets have ears carved on them.

10. Birth, marriage, and death.—The ceremonies at birth have not been recorded; but, as the names are often compounded from those of gods, it is probable that some religious ceremony attended the naming of the child, as in Egypt (see BIRTH and CIRCUMCISION (Egypt.). Of marriages we know scarcely any more. The settlements of the XIXth dynasty are purely business documents. The domestic magic-contracts are without any religious reference. The terms in the XXVIth dynasty agreed on for divorce by the man are confirmation to the wife of her marriage portion, and control of her children's share of patrilineal property, also a third of all property acquired by the pair during marriage; but in one case the divorce terms were five times the marriage gift. For divorce by the woman, she must return one-half of the marriage portion given to her in marriage (see BIRTH and CIRCUMCISION (Egypt.). In Copitic times the terms were very similar. The only trace of religious terms is the belief in the clause by swearing by Amen and Ankh (Griffith, Demotic Poppy, Kyklands, London, 1909, p. 115). In Copitic times it is said: 'Since God willeth that we should unite one with the other'; but either party could divorce freely on paying seven times the marriage gift, and no provision was stipulated.
for the children. The religious sanction of marriage seems, therefore, unknown in the pagan and scarcely named in the Christian contracts, which accord with the temporary aspect of the deed, and the constant provision for divorce.

The great religious event to an Egyptian was his death. There is no trace of spiritual preparation or viaticum. The body was simply handed to the embalmers, and they prepared it without the slightest reverence or sentiment. After the seventy days came the greatest ceremony of private life—the funeral; the procession, the wailers, the reciting, and the interment, the mummification of the body, and the burial, the ritual service of funeral offerings, for which endowments were left, like those for masses in Europe. See, further, art. DEATH (Egyptian).

11. Dancing. Another development of popular religion was dancing. In the earliest royal monuments the dance of men in the festival of Osirisification of the king is represented; this took place, apparently, in an enclosure formed by cloth hangings placed on poles, and the conventional figure of this was represented behind the prince, down to the latest times. Dances of the servants are often represented in the tombs of the Pyramid age; but solemn and not only joyous, not religiously.

In the XIth dynasty the princesses are described as dancing with their ornaments before the king, and singing his praises. The sculptures and paintings of the XVIIth–XXth dynasties show many scenes of funeral dances; usually one woman held a tambourine aloft and beat out a rhythm on it, while others danced round. Exactly this dance may be seen now when parties of women go up to the cemetery a fortnight or a month after the funeral; an old negro is often the drummer, and the party stop every few hundred yards along the road for a dance. The dances are mentioned by Herodotus (ii. 60) among the parties going to the great festival at Buhaetis. Dancing was a considerable part of the public worship of the ascetic Therapeutae in the Roman age. At their great gatherings, held every seven weeks, they 'keep the holy all-night festival . . . one kind bearing time to the answering chant of the other; dancing to its music . . . turning and returning in the dance' (Philo, de Vita Contemplativa; see G. R. S. Mead, Osiris and Osiris, London 1900, p. 80 f.). This must have been much like an orgiastic modern zibar, only performed by men and women in opposite companies. That so scrupulous and ascetic a community, generally devoted to solitude, should make religious dancing so important and so mixed points to a much freer use of dancing by the unrestrained public.

12. Wayside shrines. The individual worship took place not only in the house, but also in the wayside shrines. The open-air shrines common now in Italy are represented in Egypt by covered shrines, where shelter from the heat may be enjoyed by the devotee. These shrines, or uge, at present abound in Egypt, being small conical chambers of brick covered with a domed roof, and usually containing a cenotaph of some local holy man. The native passing them will utter a short ejaculation, and stop to pay his respects, or, further, will walk round the cenotaph either inside or outside of the building. Similar shrines are frequently reproduced in the Roman terra-cotta figures, and were evidently as familiar in ancient times as now. They are placed against the inner face of the little entrance on one side, enclosing a square; a column placed at each corner supported an arched roof over it. A similar form, entirely of wood, was mounted on wheels for the purpose of carrying an image. The more solid shrines were built up in brickwork on all sides, with lattice windows, and covered by a double-sloping roof, with gable in front. When a village or town extended round an earlier shrine, and enveloped it, the little sanctuary became rich, and needed a dwelling for the priest and a storeroom. But the site could not be enlarged around; so the building was carried upward, as shown by another model. Here the open shrine was raised by two or three steps, and lamps burned on either side of it; but without the slightest reverence or sentiment. After the seventy days came the greatest ceremony of private life—the funeral; the procession, the wailers, the reciting, and the interment, the mummification of the body, and the burial, the ritual service of funeral offerings, for which endowments were left, like those for masses in Europe. See, further, art. DEATH (Egyptian).

13. Festivals of fertility and harvest. The popular worship on a collective scale was seen in the great festivals. How large and important they might be, we know from the size of the gathering at the festivals of the present day. The great feast at Tanta is estimated to attract 200,000 people. That it is an occasion for general licence to the loose-living part of the population doubtless descends from the customs of the ancient festivals, as shown by the acrostics of Horus. The two great festivals kept everywhere were the fertility feast and the harvest feast. At the first the 'gardens of Osiris,' like the 'gardens of Adonis' in Syria, ornamented the house. These are sometimes found preserved, as bowls full of Nile mud, and pierced with the holes left by innumerable sprouts of corn. Another method was to make clay figures of Osiris, stuffed with corn, as sometimes found; on wetting these, the corn would sprout from the body of the god. Still larger figures are represented, doubtless from the official feast, where the statue of Osiris is lying on a bier surrounded by acclamations (see Herodotus, London 1900, p. 80 f.). The following method of the planting in Upper Egypt is stated in the calendar to begin on the 14th Oct., millet on the 18th, and barley on the 19th; this feast of the growing corn was probably that named on the 21st Oct. (Choiak 11) in the Skylitir calendar as the 'day of the panegyric of Osiris at Abidos'; the following day was the 'day when he transformed himself into a bezen bird,' probably a bird liberated from the green couch of Osiris to represent his resurrection.

The second general festival—that of harvest—fell during April, as the harvest is reckoned to begin with this month in the south, and end with it in the north. This was celebrated by offerings to Ramnut, the serpent-god of harvest. After the threshing the grain was pilled up, as it may now be seen in immense heaps lying in the open air at the large stores; the winnowing shovels were stuck in the heap, with the handles turned in the heap, the tossing boards or scoop were held on high before it, the corn-measure crowned the heap, and Ramnut was adored (stele in Bologna Museum).

14. Great temple feasts. The details of provision for the great temple feasts have been preserved to us in the Harris papyrus (see Petrie, Hist. Studies, London, 1911). From that we gather the details of a festival of 20 days in March, and another of 27 days in August. In the March feast 10,000 persons were present on the great day, and 4000 on other days; in the August
feast 4800 on the great day, and 100 on others. The temple façade was decorated with tamarisk branches, Reed-grass, and hundreds of bunches and chains of flowers. Tables of provisions of meat and cakes were set out for the priesthood and the nobles. Large quantities of food were provided for the people, mainly various breads, cakes, and fruit. Flowers for each person, to be offered by each, were supplied. Thus was the general character of the great temple-festivals in honor of the local gods.

The festival of the New Year has a remarkable feature in the appointing of a mock king and his being sacrificed. This is not referred to in the ancient calendars, as it was a particular rather than a religious anniversary; but, happily, an account of the survival of it has been preserved. Knunziger records (Upper Egypt, Eng. tr., 1878, p. 184):

"For those days it is all up with the rule of the Turks; every little town chooses for itself... a ruler who has a towering fool’s-cap set upon his head, and a long spectral beard of false hair tied to his chest, and a yellow floral garment, and is clothed in a black bow.... With a long sceptre in his hand... he promenaded... Every house was decorated, and the door was arranged by the governor of the province... lets himself be stoned, while the new dignitary seats himself on his throne, that is, his corpse, is burned in death by burning, and from the ashes creeps out the slavish Pasha."

The modern copy of the crown of Upper Egypt, which bears upon its top the sceptre to the descent of this custom.

15. ‘Sed’ festival.—In connexion with this should be noticed the great Sed festival. It appears to have been normally celebrated every 30 years, and to have been on the occasion of the king being deified as Osiris, and the Crown Prince being appointed and married to the heiress of the king. It was to be the amelioration of a custom of killing the king after a fixed interval, in order that his royal maintenance of the public life and prosperity should not deteriorate. Such a custom of king-killing was usual in Ethiopia, until abolished in the 3rd cent. B.C. It is still practised by the Shilluk in the Sudan; also in Unyoro, in Kihanga, in Sofala, and formerly among the Zulus. Thus it is strongly an African custom. Nor is it peculiar to Africa, as it occurred in Prusia, and at fixed intervals of 12 years in Southern India. There is thus abundant parallel for such a feast in pre-historic Egypt; but, before the use of records, this custom gave place to the deification of the king, who lived on with his successor. The king became Osiris, was clad as the god, held the Divine emblems, and was enthroned in a shrine at the top of a flight of steps. Before him danced the Crown Prince, and at a different point in the ceremony the assembled men danced in the same enclosure of hangings upon poles. Sacred standards were carried in procession. In some connexion with the festival there is the record of 400,000 oxen, 1,422,000 goats, and 120,000 captives. These numbers show the national character of the ceremony, whether the figures were exaggerated or not. In the late times of the XIXth dynasty this festival of Osirification was performed much oftener, and after his 30th year Ramses II. repeated it every third year (Petrie, Stud. Hist., iii. 69). See, further, art. Festivals and Fasts (Egyptian).

16. Religious calendar.—The religious calendar of Egypt has never been studied, or even collected together. The materials are: (1) early lists of feasts, which are so much the same as to do not exceed half a dozen occasions for minor offerings; (2) the Ramesside papyrus Sallier iv., of which two-thirds of the year remains, stating the lack of recorded mythical or legendary events of each day (F. Chabas, Le Calendrier, Paris, 1857); (3) the Ptolemaic temple-calendars of Edin, Eshen, Denderah, etc., translated by Brugsch (Drei Fest-Kalender, Leipzig, 1872); (4) a few feasts noted by Ptolomarch (de Is. et Osr.); and (5) the modern Coptic calendar (published by R. N. L. Michell and E. Tissolet. Cf. art. Calendar (Egyptian).

The ancient calendars are still used, those of the temples referring mainly to the festivals held in the temples on which they were recorded. On comparing the lists of Edin and Eshen, which were of the same age and region, we find but six feasts identical in the two calendars. When we try to connect calendars of different periods, the shifting of the month-names through all the seasons presents the first difficulty. Owing to not observing leap-year, the nominal calendar rotated through the year in about 1460 years. Hence the question arises, which of the religious anniversaries were attached to the nominal month and day, and which to a day in the fixed year, both classes being named in inscriptions. The seasonal anniversaries must necessarily belong to the fixed year. On comparing the Sallier papyrus (of the age of Ramses II. or a little earlier) with the Ptolemaic lists, we find not a single festival or event attached to the same day in these earlier and later calendars.

That the festivals were attached to the fixed year is shown by six entries in the earlier and later calendars. We here divide the months by Roman numerals, I. to XII. for Thoth to Meseor, so as to read the intervals more readily:

<table>
<thead>
<tr>
<th>Month</th>
<th>Sallier</th>
<th>Ptolemaic</th>
</tr>
</thead>
<tbody>
<tr>
<td>I.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>II.</td>

<tr>
<td>XII.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Excepting in Plutarch, who wrote later than the Ptolemaic calendars, the interval between the early and late lists is 304 days; and this shift of the calendar on the seasons would occupy about 1256 years. The date on which the Eshen calendar was compiled is fixed by the New Year feast, of the fixed year by Sothis, falling on 26 X., which occurred in 138 B.C. The date of the Sallier calendar is, therefore, 1255 years earlier, or 1308 B.C.; and this agrees well with its having the name of Ramses II. scribbled on the back of it, as he began to reign 1390 B.C. Hence for any connected view of the calendar it is needless to compare the dates of the shifting months into fixed days of the year, corresponding with the epoch of the calendar. To compile a detailed religious calendar would be beyond the scope of this article, but the principle of fixed dates is here stated, as it has not yet been published.

We will now state the nature of the religious events which were notified in the calendars. The principal classes are:

<table>

17. Lucky and unlucky days.—Personal directions are given only in the Sallier papyrus. Originally every day was noted as favourable, auspicious, or cautionary, or some days of mixed character. Of these 223 remain, and there are also applied to these days 96 general directions as to going out or beholding things, 54 specific directions as to acts, and 15 prognostications of the course of life in manner of death, from birth on a given day. As Chabas shows, these direc-
tions are similar to the directions for action on different days of the month given by Hesiód, the list of unlucky ‘Egyptian days’ observed in Rome in the time of Constantine—25 in all—and the list of unlucky Jewish days stated by Sallustius—24 in all. It might be expected that the bad ‘Egyptian days’ of the Romans would be the same as among the Egyptians. On a comparison of the lists, the only adjustment of calendars which yields a continuous connexion is from 18 Makhir to 25 Pharramthi, coinciding with the unlucky days 25th Feb. to 3rd May. This also is exactly the connexion between the calendars of Ramses and those of Constantine. The break between Paganism and Christianity has swept away nearly all traces of connexion. The Coptic calendar is mainly seasonal, and very seldom mentions the luck of a day. There are, however, a few days which remained fixed, and the Christian calendar has retained both the Ramesside and the Coptic calendars; and the intervals between these appear to be connected.

As these days in the Sallier calendar are connected with other evil events, they must have belonged to the fixed year, like the rest; hence it is difficult to see how a shifting calendar could have transported them 220 days. If it be so, then, these fixed seasons must have become attached to the shifting calendar in 434 B.C. and have been carried on with it till its arrest in 30 B.C.; since then they have been shifted and the difference between old and new style. The dates mentioned in the myth of Horus of Edfû do not in any way agree with the Edû or other calendars.

18. General feasts.—The seasonal dates of the feasts which are found in any two calendars, and which were, therefore, general, may be taken as within a day of the following:

| Feat of Sokar | Jan. 15 |
| Feast of the Dead | Jan. 19 |
| Feast of the Strong | Mar. 11 |
| Feast of Ptah | Apr. 9 |
| Feast of Horus | Apr. 11 |
| Birth of Horus | May 23 |
| Going forth of Isis | Oct. 1 |
| Feast of Shu | Nov. 13 |
| Feast of Osiris | Nov. 27 |
| Isis and Nebthu weeping | Dec. 8 |

IV. FUNERARY RELIGION.—19. Cause of its prominence.—The funerary branch of the religion has become better known than any other, owing to the prominence of the tombs among the other remains. This is merely a casual prominence due to the Nile deposits. The laying down of ten to twenty feet of mud over the river-valley since the flourishing days of the town has covered the remains of daily life almost entirely; only a few small towns on the desert, or the later parts of the cities which were built high up on their mounds, have remained exposed. By far the greater part of the dwellings and buildings have passed under the Nile soil and the advancing water-level, while the cemeteries, being on the desert edge, have most of them disappeared as well as all. Hence the disproportion in which we view the Egyptians, as being more concerned with death than with life. Probably the Egyptian saw and thought much less about his forefathers' graves, miles away, than the modern rustic does who walks through the graveyard every Sunday.

20. Its importance.—The tomb was essentially the house of the dead, where the soul would live; and the intrinsic fact which has made the Egyptian tombs so important to us is the custom of representing the ordinary course of life in sculpture and painting on the walls of the funerary chapel, in order to gratify the deceased with the pleasures of life. No other people except the Etruscans and the early Chinese have thus recorded their civilizations. This significance of some of this work must not, however, be put down as entirely for the dead. The great halls cut in the rock which astonish us at Syut or Beni Hasan were already in use as early as the 7th dynasty, when houses were built over tombs, and the first pyramid at Saqqâra dates from the 6th dynasty. The earlier pyramids were enclosed, and were covered with a great stone chosen to build the palaces of the living down in the Nile plain. It needed but little labour and device to cut the quarry so as to serve for the tomb, and the painting of its walls was a trilling work compared with the excavation.

21. Reason of offerings.—An essential question is whether the provision for the dead depended on fear or on love; was it for to prevent the ghost's returning or to gratify it? Both; for we view Egyptian customs as akin to those of the Troglodytes, who bound the body round from neck to legs, and then threw stones on it with laughter and rejoicing (Strabo, vi. 4. 17). On the contrary, as we see, from the 7th dynasty onward, that weapons were placed by the dead, which would arm them if they attacked the living; we find in the pre-historic times the skull frequently removed and subsequently placed with honour in the grave, as if it had been kept with affection, as it is among some races at present; the successors frequently visited the tomb and held feasts there; in Roman times the mummies were kept around the hall of the house; and to this day a widow may be seen going to her husband's tomb, removing a tile, and talking down a hole into the chamber. The treatment of the body, and the provision for it, all show no trace of repugnance or fear, but rather a continued respect and affection. We are bound, therefore, to look at the other offerings, of food and drink, of model houses and furniture, of ornaments and slaves, as equally dictated by a wish for the future happiness of the deceased.

22. Pre-historic ritual.—In the pre-historic age there was a fixed ritual of burial, which implies an equally fixed spread of belief. The use and efficacy of the funerary provision. The body was placed in a contracted position on the left side, the hips and knees bent, with the hands together before the face. The direction of the head to the south and the face to the west. The main classes of provision had each their regular place. The weapons were usually behind the back; the bag of meal and the slate and pebble for grinding it to paint the face, were before the face; the wavy-handled jar of ointment was at the head end; a small pointed jar stood at the feet; at either end of the grave beyond the body, or in a niche in its new life; Can we view Egyptian customs as akin to those of the Troglodytes, who bound the body round from neck to legs, and then threw stones on it with laughter and rejoicing (Strabo, vi. 4. 17). On the contrary, as we see, from the 7th dynasty onward, that weapons were placed by the dead, which would arm them if they attacked the living; we find in the pre-historic times the skull frequently removed and subsequently placed with honour in the grave, as if it had been kept with affection, as it is among some races at present; the successors frequently visited the tomb and held feasts there; in Roman times the mummies were kept around the hall of the house; and to this day a widow may be seen going to her husband's tomb, removing a tile, and talking down a hole into the chamber. The treatment of the body, and the provision for it, all show no trace of repugnance or fear, but rather a continued respect and affection. We are bound, therefore, to look at the other offerings, of food and drink, of model houses and furniture, of ornaments and slaves, as equally dictated by a wish for the future happiness of the deceased.

There was also an entirely different treatment of the body, often referred to in the oldest religions formulas of the Dynast, the mummy. The head was removed, the flesh taken off, the bones separated and cleaned, and then re-composed in right order, and the whole body put together again. This was supposed to purify the dead, and be fit to associate with the gods (see Gérèz, the Labyrinth, and Macquhench, 1912). The traces of these customs, which probably belonged to the Osirian worshippers at very remote times, are also found in a small ordination of the desert in historic times. The latest clear group, in the Vth dynasty, had one-third of the bodies partly dis-
membered, with the hands and feet cut off and laid on the stomach beneath the swathing of the body. The earliest graves were pits roofed over with poles and bushwood, so as to leave a chamber. Later a recess was made in the side of the pit to hold the body, and fenced across, as a tomb is. In the early dynasties a rock chamber was usual, later a brick shaft with a chamber at one side of it. Only in Christian times does the chamber seem to have been abandoned, and the open grave preferred. Under Isian, the chamber, with room for the corpse to sit up in it, is considered essential. Cf. artt. ANCESTROR-WORSHIP (Egyptian) and DEATH AND DISPOSAL OF THE DEAD (Egyptian).

23. The ‘ka.’—Before we can follow the different views of the future life, we must look at the beliefs on the nature of man. The earliest tombstones, those of the 1st dynasty, show the khu bird-like, that is to say, without the bird-like soul was then recognized the kha, the ‘glorious’ or ‘shining’ intelligence, as dwelling in the kau, the activities of sense and perception; both of these were the immediate centre of the soul, or material body. The idea of the kau is difficult to explain, as we have no equivalent. It was closely associated with the material body, as it had parts and feelings like the body. All funeral offerings were made to the kau. If any of the funerals in life were missed or neglected, it was said to be grievous to the kau; also the kau must not be needlessly annoyed. Here it seems to stand for the bodily perceptions and pleasures of the animal nature; it was the least physical force after death, although it retained consciousness and could visit other kau and converse with them. The kau could also enjoy the offerings and objects of life in representation; hence the great variety of funeral offerings, and the detail of the sculptures and paintings representing all the actions of daily life, the hunting in the desert, fishing on the river, beholding all the farm-yard, and the service of retainers, dancers, and musicians. A recent discovery adds to the complexity. Not only is the kau of the king represented as born as an infant at the same time, before the divinities of satisfaction in life were conceived, but the king holding a standard of ‘the king’s kau,’ but we even see the kau holding the feather fan and following the king on his throne. This suggests that the king’s kau may have had a separate physical body; and, as the Egyptian believed in horoscopes, so a child born at the same hour as the king would have the same fate, partake of the same soul, and was perhaps selected to accompany the king as his double and serve for life. One being might have many kau; Râ had 14 kau, Tahutemis I. was the first king to have more than one kau, and Ramses II. had 30. The kau being so far separate could be taken by the Semitic mind as the equivalent of the Semitic guardian angel—an idea entirely foreign to the Egyptian; and thus it comes that we find the Semitic king Khyan with the ‘goat’ as the beloved title by which he was addressed. Later this dedication of the kau proceeded, and on the sarcophagus of Panhemisis we read, ‘Thy kau is thy god, be parted not from thee, and so thy soul lived eternally’ (Bissing, Versuch . . . der Kau’s, 1911). It may be that the kau is the counterpart of the soul, the kau dwelling, and saving the soul. This comes fully into touch with the doctrine of the Logos in its development; they possess Logos only and not Mind (Peters, Rec. ii., London, 1880, p. 52) is the stage of the purely human soul as the kau.

Next, ‘Thou art being purified for the articulation of the Logos’ shows the Logos as a saving or Divine principle or the Logos, and not of the kau (ib. 93). The later growth was ‘The Logos is God’s likeness,’ and ‘The Logos that appeared from Mind is Son of God.’

24. The ‘ba.’ An entirely different pneumatology is that of the ba, which is the disembodied soul figured as a human-headed bird. This is associated with the tree-goddess of the cemetery; out of her great sycamore tree she pours drink and a food to feed the soul. In the early dynasties a rock chamber was usual, later a brick shaft with a chamber at one side of it. Only in Christian times does the chamber seem to have been abandoned, and the open grave preferred. Under Isian, the chamber, with room for the corpse to sit up in it, is considered essential. Cf. artt. ANCESTROR-WORSHIP (Egyptian) and DEATH AND DISPOSAL OF THE DEAD (Egyptian).

25. The ‘ab.’—Other concepts were also associated with man, though seldom with any further religious views. The most important of these was the ab, the will, and many Egyptian deities could not resist the least physical force after death, although it retained consciousness and could visit other kau and converse with them. The kau could also enjoy the offerings and objects of life in representation; hence the great variety of funeral offerings, and the detail of the sculptures and paintings representing all the actions of daily life, the hunting in the desert, fishing on the river, beholding all the farm-yard, and the service of retainers, dancers, and musicians. A recent discovery adds to the complexity. Not only is the kau of the king represented as born as an infant at the same time, before the divinities of satisfaction in life were conceived, but the king holding a standard of ‘the king’s kau,’ but we even see the kau holding the feather fan and following the king on his throne. This suggests that the king’s kau may have had a separate physical body; and, as the Egyptian believed in horoscopes, so a child born at the same hour as the king would have the same fate, partake of the same soul, and was perhaps selected to accompany the king as his double and serve for life. One being might have many kau; Râ had 14 kau, Tahutemis I. was the first king to have more than one kau, and Ramses II. had 30. The kau being so far separate could be taken by the Semitic mind as the equivalent of the Semitic guardian angel—an idea entirely foreign to the Egyptian; and thus it comes that we find the Semitic king Khyan with the ‘goat’ as the beloved title by which he was addressed. Later this dedication of the kau proceeded, and on the sarcophagus of Panhemisis we read, ‘Thy kau is thy god, be parted not from thee, and so thy soul lived eternally’ (Bissing, Versuch . . . der Kau’s, 1911). It may be that the kau is the counterpart of the soul, the kau dwelling, and saving the soul. This comes fully into touch with the doctrine of the Logos in its development; they possess Logos only and not Mind (Peters, Rec. ii., London, 1880, p. 52) is the stage of the purely human soul as the kau.

The ruling power of man, decision and determination, was separated by the theologians, who multiplied these divisions, and was called sekhem, the sign for which was a baton or sceptre. The shadow was also named a khouhet, for which the sign was a large fan used to shade the head.

26. The ‘ran.’—The essence of a name (ran) was very important, being the essential for true existence, both for animate and inanimate bodies. To possess the true name of a person gave power over its owner; without the name no magic or spell could affect him. A great myth, found in New Zealand as well as Egypt, is the gaining of the true name of the sun-god by stratagem, and so compelling him. Isis thus gained the two eyes of Ra—the sun and moon—for her son Horus. This importance of the name led in Egypt, as elsewhere, to the real name being avoided, the scribe giving some trivial name was currently used. On monuments it is usual, especially in the IVth and XXVIth dynasties, to find the ‘great name’ given, and also the common or ‘little name,’ the great name is often formed from that of a god or a king.
so as to place the person under divine protection in his future life.

27. The under-world.—The under world (Ermann, *Egyp. Rel.*, London, 1907, pp. 109-114), through which the soul had to pass, was divided into the twelve hours of night, so entirely was it associated with the sun's course. These twelve spaces or variously called fields or caverns, the latter idea of which will probably have been the sense of the sun going under the solid earth. Each space has a large population of gods, of spirits, and of the dead. The special goddess of each hour acted as guide, through that hour, to the tomb and company of gods. The first hour is said to be 800 miles long, till Ra reaches the gods of the under-world. The second hour is 2600 miles long. The third is as long, and here Osiris and his followers dwell. In the fourth and fifth hours dwells the ancient god of the dead, Sokar, and his darkness cannot be broken by Ra, the later god. 'Ra does not see who is therein.' Ra has his boat changed into a serpent, to crawl through the delitigible night sixth hour is the body of Osiris. In the seventh is the great serpent Apap—a tradition of the boa-constrictor. The flesh of Osiris is here enthroned, and his enemies lie beheaded or bound before him. Here also are the burial passages or the gods' and goddess' of the sun, Shed, and Tefnut, and others. In the ninth hour the rowers of the sun-boat land and rest. In the tenth a beetle alights by Ra. In the eleventh hour the ship's rope becomes a serpent, and the ship is dragged through a serpent nearly half a mile long, and, as it emerges, Ra becomes the beetle, the god of the morning—Khepera. It is notable that the Egyptian had even an exaggerated idea of the size of the earth, as that only 100 miles to each hour on the equator, while the hours of the under-world are reckoned as 2600 miles each. Another version of these ideas imposed great gates between the hours, each guarded by watchers and fiery serpents. Another form was that of the fields of Aalu, which had 18 or 21 gates, each guarded by evil genii, with long knives in their hands (Petrie, *Gizeh and Rifeh*, 1897, pls. xxxvi, D, E, F). Yet another idea was that of a great variety of roads, which had to be known to the soul, and for which an account of sixteen roads was placed upon the sarcophagus. Another chapter concerns elephants nets or snakes which have to be avenged. There was also a chapter for ensuring that the head should be restored to the body after it had been cut off in the early dismemberment usage. The text of this chapter is in the VIth dynasty (see Petrie, *Denderah*, 57 f.).

28. The 'ba' in the cemetery.—The Egyptian beliefs regarding the future life were very incongruous, and various elements were mingled, regardless of their consistency or relative possibility. Many of these beliefs still survive in Egypt, in spite of Christianity and Islam. In Middle Egypt there is still a custom of placing jars of water and plates of food in the tomb, though it is considered as likely that only by casual inquiry can this be learned. In one case a mattress was put beneath the dead; but it was said that on no account was any metal put in the tomb. This survival of the belief in the resurrection shows us how easily it continued to be held throughout Egypt, with the later dogmas of the kingdom of Osiris and company of Ra.

The soul then was thought of as a human-headed bird, the ba, flying in and out of the tomb. It required access to the food provided for it, which was stored in, or around, the chamber. In the pre-historic times, graves were placed close round the body. When the larger tombs of the earliest kings were developed, the body was enclosed in a wooden chamber of beams, and the offerings were placed round the body. The periods subdivided into a line of store chambers, which were later built of brick. Jars of wine, water, corn, grapes, and other food were provided by the hundred; hoardens and heads of oxen, trussed geese, cakes, dates, pomegranates, all abounded; chambers full of knives and weapons, for hunting and for fighting, succeeded to the flint-knife and mace-head of the earlier years; while finely wrought stone dishes and bowls of the most beautiful materials, including also the rare copper, were stored for the table service. The servitors were all quickly buried to go with their king to the underworld; the body in the tomb-chambers to dry before they were sacrificed and placed in rows around the great tomb.

The soul required a way of access to its provision and to the outer air. In some large tombs of the IVth dynasty, Khepera, Shu, and Shed, the ground surface was overlaid by the mastaba; in this was placed a row of model granaries of mud, extending for ten or fifteen feet, and a little passage a few inches square led from the tomb-pit to this gallery of provisions. In tombs of the Vth dynasty a similar little opening is provided from the tomb-shaft out to the funeral chapel. In later times other provision was portrayed, though the idea was probably older than that described. The great shady acamore trees which stood over the cemetery were looked on as the house of a kindly goddess, who was later identified as a Hathor. She provided food and drink for the wandering souls, and is shown looking out of her tree, pouring from her vase and dropping cakes from her tray to feed the ba before her.

29. The 'ka' and its imagery.—A different and less material view of the soul arose, and in place of a human-headed bird it was thought of as the ka, or will and consciousness of the person, coinciding with the sensations of the body, and therefore filling exactly the same form, but incorporeal. As the body had a ka, so all animals had kæs, as they also felt; but everything that existed was by a feeling of Animism endowed likewise with a ka. Proceeding from this, it is fæs world, and it is to be contained, and in the full sense a duplicate of the corporeal world in which it resided. Hence the ka could enjoy the models of food which contained the kæs of the food; it could enjoy the figures of men and animals, as it had enjoyed the corporeal forms when in the body. A whole world of imagery could thus be provided for the life of the ka; and that it was intended for this conception is shown by every part of it being to be for the ka of so-and-so. The life-like statues were for the ka to dwell in, that it might not wander disembodied; the more closely like life, and the more the clear eye glitteretl and the mouth seemed ready to speak, the happier the ka. The same was in the wider doctrine of the ka was, therefore, the great inspiration of Egyptian art.

Both of these views of the future life are so entirely founded on the immediate touch, or connexion with any god, that it seems difficult to suppose that they arose along with belief in any great Divinity. They seem to belong entirely to an animistic world, and to be, therefore, the belief older than any of the theories which entered Egypt. The idea of the immortality of the soul seems older than any belief in a Superior Being
To accompany women there are sometimes pottery figures of girls without clothing, in forms like those of men, but nude. These have an older woman robed to oversee them, as the male figures have often an overseer dressed in a waistcloth or robe. The number of the figures varies, but in the most complete tombs of the Saites and 400 was the regular supply; sometimes there is one overseer to each ten workers. The name *ubabti* is usually understood as an ‘answerer’ who responds to the need; it is difficult to explain, in the shorter form *ubati*, as referring to the figures being made of sycamore wood. The history of the changes of form and material hardly belongs to the religion.

In Greek times, after these figures ceased to be made, it was usual to write that a deceased man had ‘gone to Osiris’ in such a year of his age.

33. The fellowship of *Rā*—Another complete theology of the future was connected with the sun-worship of *Rā* and the gods associated with him. This was bound up with the soul’s going to the west, and probably Khentamenti, ‘he who in the west,’ was a god of the dead in this system. Certainly in the fifteenth dynasty Osiris was worshipped there, and Abydos was the place specially where the desert valley in the west led to the abode of the dead. In the dark world of the dead there were no sky, sun, moon, stars or trees; but the necessity protection could be avoided; and the necessary protection could be obtained by joining the boat of the sun, and so being safely led through the successive gates of the hours guarded by the evil spirits. The dead is figured sometimes as just entering the boat and approaching the company of the gods who sail with *Rā* through the hours of day and night. In order to enable the dead to reach the boat of the sun, it was needful that he had been provided with food, drink, and одежда and interceded in its daily round. Hence a model boat with a crew upon it was provided in the tomb, especially in the Vth-XXIst dynasties. It had all the fittings—a sail for going up the Nile, and oars for rowing down—or sometimes two boats were differently rigged according to their direction; a peg for tying up at the shore, a mallet to drive the peg, and a landing plank were also provided.

34. The mummy and amulets.—In none of these views—of the *bt*, the *ka*, the Osirian or the Rā company—has the material body any part. These views were probably all formed before historic times, and even in later Osirian systems, arising about the end of the IIIrd dynasty, a system of mummifying. Before that the body was often perfectly dried in the soil, but not artificially dried. This embalming; therefore, was apart from all the views which we have described. It developed another system—that of protective amulets. In the Vth dynasty we find strings of amulets of carnelian or ivory placed around the wrists and the neck. The most usual forms are the jackal head, lion head, frog, bee, clenched hand, open hand, leg, *wzj* eye, and scarab. After this age the amuletes diminished, and in the XVIIIth-XXIst dynasties only one or two glazed figures of gods were used. With the XXVIIth dynasty there burst out an enormous development of the system. Figures of the gods in glazed pottery or faience, *uzj* eyes, and scarabs in all stones and materials, rarely gold *bt* birds with inlaid wings, and gold seal rings, were arranged in rows upon the body, often fifty or more figures in all. By Ptolemiac times the amuletes were larger and coarsely made in blue pottery, and they seem to have been entirely before Roman times (cf. art. CHARMS AND AMULETS [Egyptian]).

This elaborate armoury of amulets was designed to preserve the body from being attacked or broken down, and to ensure that it should remain complete for the habitation of the *ka*. This preservation of...
the body led to an entire reversal of the older ideas. In all the dynastic ages the construction of a costly tomb for the dead was quite as needful as the preparation of the corpse. In the Roman age however, the coffin was enamelled and very elaborately wrapped, often with a portrait over the face, and then kept for many years in the house, after which it was roughly buried, without any care, in the cemetery.

V. THEOLOGY. — 35. Animal-worship. — In considering the worship of the gods, we shall endeavour to separate the successive stages which have ruled in Egypt. Maspero has pointed out how the jackal-worship predominated at Thinis before the rise of the jackal-headed Khentamenti, or the still later Osiris-worship, at Abydos. He notes also how the Osirian conception of the fields of Aaru is earlier than the solar view in the Book of Knowing Duet, or the under world. From such traces of the growth of the theology, and the proofs of independence of the sources of the gods, shown by their compounded names, we arrive at the historical view of the successive strata of the theology. We have: (1) the pure animal-worship; (2) the animal-headed gods with human bodies; (3) the human gods of the Osiris cycle; (4) the cosmic gods of the Ra cycle; (5) the god-worship (deified); (6) the gods brought in from foreign sources, and not originally belonging to a part of the Egyptian population.

The animal-worship is based on two main ideas: (1) The sanctity of one species of animal to one tribe; (2) the sacramental eating of an example of the sacred animal at stated intervals. That the whole of a species was sacred among a tribe is shown by the penalties for killing any animal of the species, by the wholesale burial and even the mumification of every example; and by the plural form of the names of the gods who were later connected with the animals, such as Heka, ‘hawks’; Khnum, ‘rams’; Hau, ‘birds’.

The sacramental slaying or eating is known in the case of the bull at Memphis (Mariette, Le Strapathe de Memphis, Paris, 1882, pp. 11, 14, 16) and the ram at Thebes (Herodotus, ii. 42). From that appears to have sprung the keeping of an example of the sacred animal. It is well known that, in countries where human sacrifices were offered, it was usual as a compensatory measure to keep the victim for a long time—for such as a year—in the greatest indulgence and luxury, and to deny him no pleasures. This principle naturally resulted in keeping the sacred animal which was destined to be sacramentally eaten, and feeding and honouring it as a god. The keeping of a sacred animal will not account for its being consumed, rather the contrary; but the intended sacrament on the animal will be ample reason for keeping it with all honour. Hence we seem bound to accept the sacrament as the primary idea: the tribe needed at intervals to unify itself with its sacred species by absorbing the animal as a whole, like the Norse burial of portions of a king in the fields to ensure their prosperity and fertility.

36. Sacred animals. — The sacred animals whose local worship is known have obvious qualities for them they might have been selected; but whether those qualities were the sole cause of their celebrity or whether the tribe had a totemistic belief in its connexion with the animals is difficult to determine. The only species which was honoured by one tribe does not prove a belief in a connexion, because the earliest stage of totemic belief has similarly only one god for one tribe. So far as this evidence goes, the animal species was just as much the later god to the tribe. Nor does the use of the figure of an animal as a standard prove a totemistic connexion, as many of the names had standards which were revered—such as the crook and flail at Heliopolis, or the mace at Memphis—but which could hardly be regarded as gods of the people. The principle of reverence sufficiently accounts for the standards without supposing any closer connexion in some cases.

The baboon was adored as the emblem of wisdom, and of Tahuti, the god of wisdom. The appearance and ways of the baboon naturally originated this belief. Four baboons were kept as sacred in the temple at Hermopolis; they are often represented as adored, from their habit of chattering at sunrise. Figures of the baboon abound in the 1st dynasty at Abydos.

The lion and lioness are found in the pre-historic figures, and in later amulets, but are not shown on monuments or with names. Their goddesses with the head of a lioness are named as Sekhmet of Memphis and Nubia; Bast of Bubastis, Leontopolis, Tell el-Yehmilyeh, and Letopolis; Maex of Nubia; and Tatenen, or Elephantine, and Nubia. The spirit of the peak of Thebes—or Mert-seker—is also said to ‘strike as a fascinating lion.’ The destructive power of Ra, the sun, was personified as the lioness of Sekhmet, who comes from the Herakleopolis to Heliopolis, at the bidding of Ra.

The lesser felidæ were also reverenced. In Sini the chestah and serval are figured as being sacred to Hathor. The cat was sacred to Bast, especially at Bubastis and Speos Antonidus, where Bast was equated with Artemis the hunter. The cat was also sacred to Mut, probably reverenced as a maternal emblem, at Thebes. The intensity of the popular veneration of animals, even in the latest times, is shown by the well-known story of the fanatical mob tearing a Roman soldier to pieces for killing a cat.

The bull was worshipped mainly in the Delta, where four nomes used it as a standard. The four bull-gods most recorded are: (1) Hapi, or Apis, of Memphis, whose temple lay south of that of Ptah; (2) Urmor, or Mnevis, of Heliopolis, which was a more massive breed; (3) Ka-nub, or Ramose, from whom the city was named; and (4) Bakis, or Bakh, of Hermomithis. These bulls were later connected with the gods who were worshipped at those cities. In the incarnation of Ptah, and also of Osiris as Osir-hapi; Ra was incarnate in Mnevis, and Mentu in Bakis; but these are evidently syncretic adaptations of rival worship.

The cow was apparently not as venerated (in India) except as an emblem of Hathor. Probably from her source as the cow-goddess, the horned Ashatroth, the Ishtar of Semitic origin.

The ram was also worshipped as a procreative god; at Memphis in the Delta he was later identified with Osiris; both there and at Herakleopolis he became Hershefi—the chief chief; at Thebes he became Amon, and was specially the emblem of Amon. Of all the castrated deities, Amon was Khnum the creator. This diversity of connexion of the ram proves how his earlier worship was independent of the later gods. The burial-places and sarcophagi of the sacred rams have been found at Memphis and at Elephantine.

The Hippopotamus was called ‘the great one,’ Taurt, and always remained an entirely animal-god, never partly humanized. She was the patroness of the sanctuary of the Egyptian ‘great one’ appears in connexion with Set, probably from its devastation of crops, and thus it was theogonized as Taurt, wife of Set. No local worship or temple of Taurt is known.

The jackal was the god of the dead, owing to his haunting the cemeteries and the Western desert where the soul was supposed to pass. At
Memphis he was described as 'on his hill' of the desert, and received later the name of Anpu, and a place in the Osirian family. At Asyut he was regarded as the god of flowers in the desert, for the jackal-paths are the best guides, avoiding the valleys and precipices; thus he could guide the soul to the blessed West, and was called the 'opening ways of the West'. Opo-tef, and later on Osiris, was entitled 'the who is in the Osis'. At Abydos he was called 'he who is in the West,' Khentamenti; and is later shown as a jackal-headed human figure seated on the judgment-seat of the future world. There is preserved in the pre-historic age, buried with the dead, and sometimes in special tombs of dogs; but we cannot say how far this was a part of the general canine worship, which was later confined to the wild species.

The ichneumon, or mongoose, was sacred at Herakleopolis; and was in antagonism to the neighbouring worship of the Fayyum crocodile, as it fed on the beast's eggs.

The shen-mouse was sacred at Buto and Athribis, and also embalmed at Thebes.

Of birds, the hawk was that mainly adored, almost entirely in Upper Egypt. The hawk Bubastis, worshiped at Sais, another hawk at Hierakopolis near el-Kab; two hawks were the standard of Koptos, and the names of Hierakopolis just south of Thebes and opposite Asyut show. The vulture was later identified with Horus and with Ra, who are shown in that form. The hawk was also a god of the dead in a mummiﬁed form, as the god Sokar of Memphis. It is shown in a boat which is rowed by human hands; these may perhaps be the deceased kings, as the king's soul was believed to fly up as a hawk to heaven (Sanchebat). The mummy hawk was also venerated in the region of Snef, being the emblem of Sopte, god of the East, found in Goshen and in Sinai.

The vulture was the emblem of maternity, worshipped mainly at Thebes, where the idea was later embodied as a mother-goddess, Mut. The vulture head-dress was worn by the queen-mother; and the vulture is represented spread out for protection over the king, and across the passages of the tombs to protect the soul. The vulture Nebheb was also the goddess of the southern kingdom, centred at Hierakopolis, and was used to the latest times as the emblem of the southern dominion, as the serpent of Uazet was of the northern.

The crocodile was often adored to be adored at Thebes down to the XVIIIth dynasty, as is shown on tablets; the goose was then connected with Amon.

The isis was identiﬁed with Tahuti, the god of wisdom, at Hermopolis, probably from its habit of searching and examining the ground for food. It was also mummiﬁed at Memphis, Abydos, and Thebes.

The crocodile ﬂourished especially in the marshy levels of the great lake of the Fayyum, and was worshipped as the god of the province. In later times it was here united with Osiris and with Ra. It was also worshipped at Onophas in the Delta, and at Nubti, or Onub, where it was united with Set. The men of the neighbouring city of Tentyra carried on a tribal warfare against this god of the next-nest, as depicted by an emblem (Stt. xv. 25 ff.).

The frog was an emblem of multifarious or reproduction, and of Heqet, the goddess who assisted at birth; but there is no trace of its being worshipped, though it was a frequent amulet in the pre-historic and early historic periods.

The cobra serpent was much reverenced in pre-historic times, when it appears coiled up as a house amulet to hang up, or as a necklace amulet, or coiled round a stick, or in pairs twisted together, or curled round the heath or a pottery fender. The great pyramids are shown in the mythological serpent Apep, and combined in the serpent-necked crocodile. For the desert, the cobra-headed god Apop was entitled 'the who is in the Osis.' The uraeus, or cobra with expanded hood, became the emblem of judgment and death, and appears on the cornice of the judgment-hall and on the royal head-dress. Uazet was later the uraeus, or cobra with expanded hood, which was the uraeus, or cobra with expanded hood, became the emblem of the temple of Anthropos in the XVIIIth dynasty. Serpents were commonly mummiﬁed, and even a bone or two were encased in bronze, with a future ﬁgure of the top, in the XXVth-XXXth dynasties. The serpent was looked on as the 'Agathodaimon' of the house of Ptolomaic and Gnostic beliefs. Serapis and Isis were identiﬁed with serpents, and bracelets or ringers ending in two uraei were common ornaments. Serapis also is ﬁgured as a human-headed uraeus on the popular terra-cottas for domestic use. Three goddesses were in the form of the uraeus: Uazet, worshipped at Buto in the Delta, and the symbol of the northern kingdom; Mert-saeker, 'the lover of silence,' the goddess of the dead at Thebes, supposed to reside on the peak of Thebes; and Renenut, the harvest-goddess, daughter of Ptah, was shown in the left in the last patch of corn in the harvest-ﬁeld.

Several gods were sacred: the Ozyrhynchus at the city named after it, now Beheima; the es, or Thugres, at Padies, and above; the Lepidotis at Nekhebt; the Lepidotis at Lopolis; the Lepidotis at various places.

37. Animal-headed gods.—The animal-headed gods form a distinct class, as—with the exception of Horus—they are found only in this form and never with human heads. They appear to belong to the earliest theologic stage, when gods with human qualities were introduced, and blended with the earlier animal-worship. The habit of combination of forms was already usual in the close of the pre-historic age, before any ﬁgures of gods that we know. On the slate plates are compounded animal ﬁgures and human-animal ﬁgures, with habitual symbolism of standards of tribes acting as the tribes, in ﬁghting or holding captives. The animal-headed gods are less violent in symbolism than the ﬁgures which were already usual. The earliest ﬁgure of such a god is on the seals of the IVth dynasty.

Khuemu, the creator, bears the head of the ram; and the long twisted horns of the ram are often attached to the head-dress of the kings who became Osiris, as showing their creative functions. Khuemu was especially the god of the eunuch; he is represented seated as a potter and framing man on the potter's wheel. Besides his local importance he was greatly thought of in later times, when the amulets of his standing ﬁgure are often found on mummies.

Hershefi, another ram-headed god, was purely local, and is not found outside the region of Herakleopolis, except at Mendes.

Sekhmet, the lioness-goddess, represented the fierceness of the sun's heat; she is the agent of the wrath of Ra in the myth of the destruction of mankind. Her statues are common, especially at Thebes, where hundreds of them adorned the temples. She was worshipped at Memphis, where she became the consort of Pah. Bubastis had a female cat-god; but it is diﬃcult, without names, to distinguish her ﬁgures from Sekhmet. She represented the ardor not of heat, but of animal passion, and her festivals at her city of Bubastis were celebrated in the VIIIth dynasty.

Her name is found in prie-sthalls of the early Pyramid age, but her great period was during the political ascendancy of her city under the Shishakk. As a cat-goddess, she was also the patroness of hunt-
ing, and so became identified by the Greeks with Artemis. 

Anpu, or Anubis, was the jackal-guardian of the cemetery, and the guide of the dead. His figures when acting are always human, with a jackal head, and he is sometimes shown entering the dead into the judgment of Osiris, or bending over the bier attending to the mummy. His statuettes were often placed on mummies. On the other hand, not all mummies were entitled to Anubis any known; but he passed into the Roman adaptations from Egypt, and is figured on the Gnostic gems.

Set, or Sekh, was the god of the prehistoric inhabitants, and probably one with the Asiatic god who appears as Sutekh of the Hittites—an illustration of the Asiatic origin of the second prehistoric culture in Egypt. He is shown in the Hittite dynasty and at various later times in an entirely animal form, but, when associated with other gods, in a human figure with animal head. What animal is intended is uncertain; the body form is most like a greyhound, but the peculiar upright tail with a tuft at the end is like that of the wart-hog. We have the okapi, etc., also been made. Possibly the original form was lost to the Egyptians, and conventional changes hide it. At first the god of the Fayyum was represented as a crocodile, later as the baboon, after a long struggle, by the followers of Horus. Set yet retained some adoration in the Book of the Dead and in calendrical feasts. The two were worshipped on an equal footing by the last king of the Hittite dynasty. After suppression, Set appears again favoured in the early XVIIIth dynasty; and in the XIXth the kings Seti I and II were even named after him. In later times the great popularity of Horus led to Set being entirely suppressed, and looked on solely as the evil spirit. Sekh, or Sobk, or Souchis, rarely appears, being only a local god. Statues of the human figure with a crocodile head were in the Labyrinth of the Fayyum in the XIIth dynasty. Rarely the converse is shown, and a crocodile with a human head, as Sekhot-Osiris, appears as the Fayyum god of the dead.

Seti, or Thoth, appears with the head of the ibis, never that of the baboon; but both animals were equally used as his emblems in all periods. He is seldom figured alone, but is usual in groups of gods as the herald of the judgment, and as performing rites over the body of the deceased. He was especially the patron of scribes, but was not worshipped in temples, except at his cities of Hermopolis in Upper Egypt and in the Delta.

Men'et was the hawk-god of the region from Kns to Gebalayn, but was later restricted to Hermouthis when Amon became the god of Thebes.

Hor, or Horus, was the hawk-god of Upper Egypt, especially of Edfu and Hierakonpolis. This form, with a human body and hawk head, was that of the concomber of Set; the entire hawk form is not found associated with other gods, and the purely human form appears only as the son of Isis. The hawk-herons with the head of the crocodile, etc., have also been made. By the followers of Horus, is so represented as a Roman warrior on horseback slaying a dragon—the prototype of St. George. The figure of Hor, or Horus, from the Osirian cycle is that of Hor-ur, Horus the elder, as a tribal god before being merged in the Osirian family.

The human gods belong to two great groups—the Osirian family and the Amon family, besides the goddess Neith. These are marked off by not adopting animal forms, or being cosmic or Nature gods, or representing single abstract ideas.

(a) Aset, or Osiris, though so familiar to us, is mainly known from late sources, which were modified by other ideas. In the Book of the Dead, the Osirian portions are earlier than the solar portions, yet both are so early that they are mingled in the Pyramid texts. We cannot doubt that the Osiris worship arose in the pre-historic age; the oldest evidence of Osiris, however, is in the Nineteenth Dynasty. In the early Pyramid age, Anubis only is named in the funeral-formula, but in the Vth dynasty Osiris takes his place. In the earlier dynasties only kings were entitled to Anubis as a god; in the New Kingdom, in the Sed festival; but in the XVIIIth dynasty, and later, every deceased person was entitled the 'Osiris,' as having been united to the god. Neither at Abydos nor at Philae is Osiris named on the earlier monuments, although in later times he was especially the god of both places. It seems that the extent of Osiris-worship was growing throughout the historic period; this may be due to Osiris gradually regaining an earlier position, from which he had been ousted by the new gods of invaders.

The myth of Osiris is preserved in its late form by Ptolemy; the main outlines, which may be primitive, are as follows. Osiris was a civilizing king of Egypt, as priest, until in Roman times his Set and seventy-two conspirators. Isis, his wife, found the coffin of Osiris at Byblos in Syria, and brought it to Egypt. Set tore up the body of Osiris and scattered it, and Isis restored it, and built a shrine over each of them. Isis and Horus then attacked Set and drove him from Egypt, and finally drove the Red Sea.

Another view of Osiris is that of a god of fertility (see Frazer, Anat. Attis, Osiris, 1897, p. 283). He is represented as lying surrounded with green plants and sprouting corn, and his figures were made full of corn. This was probably a view resulting from Isis being the ever-living god of the dead, who might be regarded as the source of returning life. The division of his body into fourteen or more parts, each buried in a different nome, appears to belong to the idea of dividing a body of a king or great man, and burying portions in various places to ensure the fertility of the land. For lists of the Osirises and places, see Petrie, Historical Studies, pl. vii.

Aset, or Isis, was originally an independent goddess, but by political changes she became united with the Osiris myth, as the sister and wife of Osiris. Her worship was far more popular than that of Osiris. Persons were more often named after her, and as a god of learning, he was specially the patron of scribes, but was not worshipped in temples, except at his cities of Hermopolis in Upper Egypt and in the Delta.

Nebhath, or Nephthys, is placed as the sister of Osiris and Isis, but is figured as only a complementary second to Isis. Yet she was worshipped at Letopolis, Edfu, Diosopolis Parva, Denderah, and the Iseum. This worship and her name—Neb-hath, or Neb-het, or Neb-hetet, or Neb-het—seem to show that she was originally a more important consort of Osiris, who was pushed aside by the amalgamation of the Isis-worship in the group. She usually appears opposite to Isis, in the same attitude, mourning over Osiris.
Horus, or Heru, Herus, is a most complex divinity, in the various worship which were united together, and in the different aspects under which he became popular. The different alliances of tribes at various times led to three human forms: (1) the greater Horus, i.e., that Horus who is the god of Leviticus, portrayed the older than the rest of the group; (2) Horus, son of Osiris, avenger of his father; (3) Horus, the child, Har-pekhty, Harpocrates, son of Isis.

(1) Her-nw was the son of Hathor, whose name, the child of Horus, was Horus, that she bears her position largely from her son. He was specially the god of Lotetopolis, north of Memphis, also worshipped at an upper centre of Hathor-cult, the cities of Denderah, Qas, and Nubti, and in the Fayyum. (2) Horus, son of Osiris, the 'avenger of his father, usually hawk-headed, spearing the evil crocodile, trampling on Set, driving his party out of Egypt, establishing smithies of his band of shemu, or followers, and, lastly, attendant on Osiris in the judgment. He was also Hor-sam-taui, 'Horus, master of both lands,' as conquering Egypt, from the Set party. (3) The most popular form of Horus is as a child, seated, with long golden hair, of Isis and Horus are known from the IVth dynasty, but the great spread of this form was in the later times of the XXVIIth dynasty, and on to Christian times. We find Horus, in the stereotyped figures of Isis and Horus, as representing the god, as a child, seated in Indian attitudes, point to a connexion. Horus, as an infant carried by Isis, or being suckled by her, is the most general late type, continued till the 4th or 5th century. The absorption of this type, as an entirely new motif, into Christian art and thought took place under the influence of Cyril of Alexandria, by whom Mary was proclaimed as Mother of God in A.D. 431. Henceforward these figures are not of Isis and Horus, but of the Madonna and Child.

(b) The Theban triad were also entirely human, without any animal connexion until later times. Amon was the local god of Karnak. He was probably closely connected with the god of the neighbouring desert of Koptos; and a late legend points to Min being the earlier and Amon being a variant, as Isis is said to have divided the legs of Amon, who could not walk before, but had his legs welded together. (Ptolemy, xxxii. 120.) Min is always shown with the legs joined, Amon with the legs parted. Moreover, Amon is often shown in the Ibyphallic form of Min. Had the princes of Thebes not risen to general dominion, probably Amon would have been as little known as many other local gods; but the rise of the XIth and XIIth dynasties brought Amon forward as a national god; and the XVIIIth dynasty from Nebia, holding Thebes as its capital, entailed that Amon became the great god of the most important age of Egypt—the XXVIIth—XXVIIIth dynasties. He thus became united with Ptah of Heliopolis, the greatest god of the Delta; and Min is the motif because the figure-head of Egyptian religion, king of the gods, and 'lord of the thrones of the earth.' Important as Amon was, he was never intruded upon the machinery of the Egyptian temple. He was not a god of the desert, nor in Nubia. A special feature of his worship was the devotion of the queens of the XXVIIth dynasty and onward to the XXVIIIth. The queen was his high priestess; and, as such, Amon (personated by the king) was her husband, and father of her children, who were consecrated from birth by this divine paternity. The temple of Deir el-Bahri portrays the divine consort of Horus. Her name was Luqoser the divine birth of Amonhotep III. The family of high priests next married the royal heiress, and became the priest-kings of the XXIst dynasty. In the XXVIIth dynasty, the line of high priestesses of the Ethiopian family was in possession of Thebes, but the Memphis kings never married them, but required them to adopt a daughter of the king. Thus the high priesthood was carried on in a fictitious line. In Ethiopia, where Amon was the national god, the high priestess was always the daughter of one king, and wife of the next in unbroken female succession; during the Ethiopian rule of Egypt, a second high priestess also ruled at Thebes. The ram, which was the sacred animal of Thebes, was worshipped in combination with Amon by the Ethiopians, and Amon appears with a ram's head at Napata and Naga.

The ram was also used in the Ethiopian dynasty (XXVth), and ram-headed scarabs are usual at that time. Mut was the goddess of Thebes, probably even before Amon rose to the front; before Amon was, the god Horus, trampling on crocodiles, and grasping serpents, scorpions, and noxious animals. This was a type commonly carved in relief on tablets to be placed as annulets in the house, and covered with long golden hair. The infant Horus also appears seated on a lotus-flower; but it is doubtful if this arose in Egypt before the type of Buddha, jewel in the lotus, might have been imported. Figures of Horus the child, seated in Indian attitudes, point to a connexion. Horus, as an infant carried by Isis, or being suckled by her, is the most general late type, continued till the 4th or 5th century. The absorption of this type, as an entirely new motif, into Christian art and thought took place under the influence of Cyril of Alexandria, by whom Mary was proclaimed as Mother of God in A.D. 431. Henceforward these figures are not of Isis and Horus, but of the Madonna and Child.

(c) Neit.—This goddess was always represented in entirely human form, holding bow and arrows, and bearing up the head closed arrows or shuttle. There is, however, no trace of her being connected with weaving, and it has been supposed that the shuttle was only a mistake of the Egyptians in later times, the primitive form being a long package crossed by two arrows (see Petrie, Egyptian Tombs, 1900, i. front.). The package might well be the skin of an animal rolled up, as in the sign shed, and so the whole might belong to a goddess of hunting. In later times the shuttle with thread upon it is clearly used for the name of the god. Neit was the most popular divinity in the 1st dynasty, queen being named Neit-hetep and Mer-neit, and many private persons also used the name. She was probably a goddess of the earliest Libyan population, and was the special divinity of the later Libyan invaders of the XXVIIth dynasty at their capital Sais. During the Pyramid period the priesthood of her temple was most usual; and the XIXth dynasty her emblem is shown as the tatu mark on the Libyan figures. She was worshipped only in the Delta, at Sais Athis Phara and Zar (Slenenmyctos), except in the Ptolemaic temple of Esne.
Aten, the sun-god, was specially worshipped at Heliopolis, and, when that older centre rose again above the invasion of the earlier dynasties and the mystery of the star, each king took a name upon accession which embodied a quality of Ra, in much the same Semitic style as the 99 names of Allah. Every king of Egypt afterwards had a Ra-name, such as Ra-nes-hen-k, 'Ra establishes the kow'; Ra-achet-pab, 'Ra satisfies the heart'; Ra-neb-nant, 'Ra is the lord of truth.' Ra was thus more constantly recognized than any other god, yet he has no temples in the great centres; beyond his own city of Heliopolis he is named only in connexion with Babylon in the same nome, at Xos in the Delta, and at Edfu, owing to his union with the hawk-god. He was, however, united with Amon, as the compound god Amon-Ra, in universal honour; and thus shared in the great worship of Amon. The need of uniting these two names shows that these gods originally belonged to different races.

Ra, not Amon, was supposed to have been the original of Heliopolis, as the worship of another sun-god, Atum, underlay that of Ra. The collateral facts point to Ra having come in as the god of Asiaites; the title of the god when he was Ra was Amon. The cosmic scene is later through the Semitic invaders; the kow sceptre was the sacred treasure of the temple; the 'spirits of Heliopolis' are more akin to Babylon than to Egypt; and the city was always a centre of literary learning. The obelisk of the sun seems connected with the Syrian worship of conical stones and stone pillars; and the 'city of the sun,' Baalbek, shows a similar worship.

Ra is shown as a purely human figure—as in his union with Amon—or as a hawk-headed figure owing to his union with the hawk-god of Edfu; or simply as the disk of the sun, especially when in his boat for floating on the celestial ocean. The disk has various emblems usually associated with it: the cobra in front, as king of the gods; two cobras, one on each side, which may refer to the double kingdom of day and night, or both banks of the Nile; two ram's horns as the creation-god; two vulture wings as the protecting god, or sometimes only one. The disk is often placed on the head of the hawk-god or the hawk-headed human figure.

Atum, or Tum, was the god of the Eastern Delta, from Heliopolis round to the gulf of Suez. Whether he was a sun-god originally, or only became so by union with Ra, is not known. He is always shown in his boat in a very special form. He was either setting sun, in some connexion with the Semitic origin of his name, the 'completed, or finished, or closed.' His special place was Pa'tum (Pithom, the city of Hamites).

Khepera is the rising sun, 'he who becomes or arrives'; only secondarily, from this name written with the scarab, was the sun represented as a scarab. He is shown mainly about the Xlith dynasty, and was already very little known.

Aten was the radiant disk of the sun, entirely separate from the theology of Ra. It is never represented by any human or animal figure, and the worship of Aten was promulgated by the devotees of Aten. The object of worship was not so much the disk of the sun as its rays, or radiant energies; these are shown each ending in hands, which give life and dominion and accept offerings. This worship was restricted within half a century or less, traces of it appearing at Amenhotep III., the full development under his son Akhenaten, and the end of it under Tut-an-kh-amon. As it appears when Syrian influence was at its height, the connexion of the name with that of Aten ('Lord') seems clear, especially as Adonis was worshipped in Syria. From the hymns to the

Aten, the worship appears to be that of the solar energy, and to have been a scientific idea apart from the usual type of Egyptian religion. Aten was regarded as the sun; he was not tolerant any other worship or figure of a divinity. Aten is the source of all life and action; all lands and peoples are subject to it, and owe to it their existence and allegiance. Aaker, 'he who leads heaven,' was the god of Thinis in Upper Egypt and Sebennytos in the Delta. He is always in human form, and carries a sceptre. His name shows that he was a sun-god, and he was later identified with Shu, son of Ra. He does not appear to have been regarded at all beyond his own centres of worship.

Sopdu was identified with the cone of light of the zodiacal glow, which is very clearly seen in Egypt. He represented the light before the rising sun, and was specially worshipped in the eastern desert, at Goshen, and Serabit in Sinai.

Nut was the embodiment of heaven, represented as a female figure, generally as a dappled lioness. She was said to dwell at Diopolis Parva and near Heliopolis, but there are no temples to her, and she is usually not worshipped but grouped in a larger figure. The sceptre and wings of Nut are usually supported by Shu, the god of space, on his uplifted hands; below lies the earth, Seb, as a man. This seems to show the lifting of heaven from the embrace of the earth by the power of space.

Seb, or Geb, was the embodiment of the earth. He is called 'the prince of the gods,' as going before all the later gods. He is thus analogous to Cuth, or, and like him, double gods. Seb and Nut belong to a primitive cosmic theology earlier than any other in Egypt. Seb is called the 'great cackler,' and the goose is placed upon his head. There seems in this the idea of the egg (named in Book of the Dead, liv.) of the sun being produced from the horizon by the earth. He is called 'lord of food,' as being provided by the earth. He was honoured at Memphis and Heliopolis, but no temples of his are known. It seems that Seb, Nut, Shu, and Tefnut remained as the cosmogony of Egypt, but had long ceased to be worshipped or to have any offerings or temples in their honour.

Shu, the god of space, was symbolized by an ostrich feather, the lightest object for its bulk that was known. His function was the lifting of the heaven from the earth; and as a separate figure he is usually shown kneeling on one knee with uplifted arms, regarded as the thunderbolt of Egypt, at Pœulis, Bighe, Enneh, and Denderah, and also at Memphis; but no temples were built to him. Shu is often grouped with his sister Tefnut, and sometimes both appear together as lions.

Tefnut was also honoured in the South, in Nubia, Elephantine, el-Kab, Erment, and Denderah, as well as at Memphis. She appears in human form, like Shu, but is often lion-headed. She was the mother of the pharaohs.

After the sun-, sky-, and earth-gods must be added the Nile-god, Hapi. He is always known by human form, a man, but with female breasts, and often barred all over with wavy lines, as regarded as the Tiber. Owing to the Upper and Lower Egypt, the Nile was similarly divided into two entities. Figures of the Upper and Lower Nile, distinguished by papyrus and lotus plants, are commonly shown as holding the sceptre of the Nile, as an emblem of the union of the whole country. Hapi was worshipped at Nilopolis and at the 106 little river-side shrines which marked the towing-stages of the Nile. The dates of inscription (Sonnenkron) are not found to refer to the festivals, except that of Merenptah on 5 Paophi, = 19 July, in 1250 B.C.
which might be at the rising of the Nile. A long
by the banks, but the chief interest of the
the river (IBP iv. 107).

40. Abstract gods: Ptah, Min, etc.—The
abstract gods stand quite apart in character from tho\nse whom we have noticed. They have no
history or legends like Osiris and Râ; and, as
abstractions, they stand at a higher level than the
Nature-gods of the simpler ages. There are no
god-cults connected with them, or any
customary celebrations. Some were probably
tribal gods, but on a different plane from those
already noticed, and seem to be of a late and
advanced character.

Ptah was the great god of Memphis, and became
the head of the Memphite triad, and later of the
ennamed. He has two apparently contradictory
characters—that of the creator acting by moulding
everything from primeval mud, and that of the
mummiform god. Whether these are not two
separate beliefs fused together we cannot yet
discern. The mummy form strongly implies a de-
ified body. From this he became the head of the
dynastic race, as all the earlier peoples buried in a contracted
position. There is also the duplicate belief of
Ptah creating by the spoken word. A further
complexion arises from his identification with the
ancient animal worship of the bull Apis at
Memphis. He was also united to the primitive
Memphite god of the dead, Sokar, in the form of a
mummified hawk; and was likewise associated
with the later human god of the dead, Osiris,
appearing as Ptah Sokar-Osiris. As a further
complication, the late figures of this fused god as
a sandy-legged dwarf are entirely different from
the mummiform Ptah and from the figures of the
other two gods. If we were to analyze these
incongruities so far as our present information
goes, they might be arranged thus:

Sokar, hawk-god of dead—primitive.
+ Osiris, god of dead—pre-historic.
+ Ptah, therefore a mummy—dynastic.
later + pataisoi of Phoenicia—dwarf.

Apis, the bull creator—primitive.

Ptah, creator by the word—dynastic.

Khmunu, the ram creator—primitive.

Ptah, creator by moulding, as Khmunu at Denderah
and Ekhmin.

Hence Ptah the artificer was simply a creator-god
of the dynastic race, who became assimilated to
the earlier gods of various kinds. It is impossible
to dissociate from Ptah the pataisoi, dwarf figures
which were introduced by the Phenician sailors
(Herod. iii. 37), identified with Ptah, and given the
same name. These, again, have some relation to
the sandy-legged or lame god of artificers,
Hephaestos. Ptah was worshipped mainly at
Memphis, and also at the next nome, Lotopolis, as
well as at Bubastis and Mendes.

Min, or Amun, as the name is sometimes trans-
literated, was the abstract father-god. He appears
as we have shown, to be the earlier form of Amun.
Like Ptah, he is enveloped in bandages; and, as
Ptah has his hands projecting and holding a sceptre,
so Min has his right arm raised holding a flail,
and his left hand holding the phallic. The origin of
this god is indicated in a late text, where the
form of a sanctuary in the land of Punt is exactly
that associated with the god (Athribis, s.viii, xx.
Though here is a god called Min, those of Punt,
and the god has a black face (Deir el-Bahari,
19x-1xxi). These details point to Min having
been introduced by immigrants from there. The
oldest figures of Punt are three blocks of limestone
found in the bottom level of the temple of Koptos,
with designs upon them, including Red Sea shells

and sword-fish, agreeing with the source stated
above. He was particularly the god of the desert,
worshipped at Hammanat, at the end of the
desert road at Koptos; at Ekhnaton, which was
probably the end of the other desert road from
Mynos to Elfin, which Haremheb opened and
ended at Edfu, Thbes, and Saqqareh. His figures are
common in the XIth and XIIth dynasties; in the
XIXth he was united with Amnon-Râ, but in
Ptolemaic times he again became important.

Hathor was also artificer, and is probably introduced as a correlative deity with Min. Her
head is seen on the column in front of the shrine of
Min (Athribis, xxiii). Her peculiar position, as
being worshipped over the whole country and
identified with other goddesses, points to her
belonging to the latest immigrants. The myth of
Horus striking off the head of his mother Isis, and
replacing it by a cow's head, points to the Horus
cult acceptance of Hathor of the dynastic people
and uniting her with Isis. Hathor's head appears as
the favourite emblem of the dynastic people
(pedette of Narmer, top, and kilt of king [Hier-
koepolis, xxvii],高三, of Hathor and the
love of Hathor are often named in the early
dynasties. The Hathor head appears as a capital
to columns at Deir el-Bahari, and in Nubia in the
XVIIIth dynasty. It formed the wig-wag, or
sistrum used in her worship, and the whole sis-
trum and head were used as the model for capitals
of columns in the XXIVth dynasty down to Ptole-
maic times (see esp. Denderah). Hathor was fused
with other deities, particularly Isis as the mother,
and she appears in most sites of Egypt. The fates
presiding over birth and destiny were called the
seven Hathors.

Maat was the goddess of truth. She had no
temples, and received no offerings. On the con-
trary, the image of Maat is often shown as being
offered to the other gods by the king. There is
also a double form, the two Maats presiding over
justice and truth (Maspero, Down, 187). These
were shown usually one at each end of the shrines
of the gods; and they appear to be the source of the
erubic figures, one at each end of the mercy-
seat, known apparently as 'Mercy' and 'Truth'
(1 P. 25' 61' 85' 80' 1 P. 31' 14' 19' 20'P). Maat
appears in the judgment scenes of weighing the
heart, as a pledge of truth, and she is linked with
Râ and Thoth. She is especially with Ptah, who is
'the lord of truth.' So little personality was
attached to this abstraction of 'truth' that, when
Akenaten proscribed the names of all the gods
in favour of the Aten, he still kept the name of
Maat 'associated with his own' in placing his
motto after his name, ankh en maat, 'living in
truth.'

Akerfem is a youthful god in human form,
with a lotus flower on his head. He appears to be
a god of vegetation and growth, and was associated
as son of Ptah and Sekhmet at Memphis. He
appears only from the XXIVth dynasty onwards,
when some statues of him and relief figures on
situs are common. No temple of his is
known, or any offerings to him.

Safekh was the goddess of writing. She is
named as early as the Pyramid times, and often
appears in the XIXth dynasty recording the festi-
vals of the king, and holding a scribe's outfit.
Her emblem was a pointet-shaped star on the
head, with a pair of horns inverted above it. This
has some connexion with the 'seven,' and the
seven-pointed star which appears as one of the
earliest emblems of divinity (Hierakonpolis, xxvi
B. 3, C. xxix). The group may well read up safekh,
'she who has the seven upon her head'; if so, she
was an early goddess marked by the seven sign
of divinity, and hence 'crowned with the seven' came
to be her title. Her true name thus appears to be lost.

Cosmogonic pairs of elemental gods were venerated at Hermopolis, sometimes by a nude (with frog heads) and by one (with serpent heads); the male names were Iteh, 'eternity'; Kuku, 'darkness'; Nu, 'the heavenly ocean'; Nem, 'the inundation.' The female names were merely the feminine of those. Manetho regards them as the equal of Seb and Nut, Osiris and Isis, Shu and Tefnut, Set and Nephthys, respectively (Dawson, 149). There are various views of the meaning of the eight; but their names seem to harmonize with the 'majesty of light,' the succession of ages, the water used in modelling creation, named in the Kere Kosmou, the earliest of the Hermetic books, which retains most of Egyptian thought. These elements were called 'the eight,' Khmnnu; and Tehnti made the ninth, the god who dominated the elements. They gave the name to the city Khmnu, now modified to Esnehneyn.

Other abstractions are occasionally named, the more usual of which are Her, the god of taste, and Sr, the god of perception. The rarer abstractions remind us of the Roman personifications of Pavor, Pulmon, etc.

42. Foreign gods. The foreign gods are those which were brought into Egypt apart from an immigration of their worshippers, and which always remained exotic. Bês, or Biter, was originally a dancing figure of Sudanesé type, dressed in the skin of the bêb antilope, the Cycnæhurus gattatus. He is often shown beating a tambourine. How such a figure came to be associated with the protection of infants and with birth is not known; but this connexion with the birth of Set in the XVIIIth dynasty (Deir el-Bahari, II) and on to the Ptolemaic age (birth-house, Dendera), The earliest example of the figure is female, in the XIXth dynasty (Prieur, Xabes, VIII, 14, 27); it is male in later times, but in the Roman age a female Bês appears as a consort. Bês had no temples or offerings, but in Roman times there was an oracle of Bêsa at Abydos. A curious intimation of this worship by the Phœnicians is the figure of Bêsa on the coins of Al-besa, 'the island of Bessa,' the modern Tripa.

Dedun was another African god, worshipped in Nubia. He was apparently a creation-god, since he was fused with Ptah, the combination Ptah-Dedun being often worshipped in the XIXth dynasty. He is always in human form.

Set have been depicted as gods of a tribe at the cataract. She is similar to Hathor, with cow's horns, and was called the queen of the gods.

Agnet was the local goddess of Seheyl, the island in the cataract, and is shown wearing a high crown of feathers.

Turning now to the Asiatic gods, the principal one was Sutekh, who may originally have been one with the Set or Seth of the Egyptians, but the separation was post-historic. When we meet with Sutekh in the XIXth dynasty, he is the national god of the Kheta, and has many cities devoted to him on the Upper Euphrates in Armenia (Petrice, Student's History, iii. 86). The Egyptians represent him with a tall pointed cap bearing two horns projecting in front and a long streamer from the peak descending to his heels (Petrice, Sima, fig. 134). Similar figures of Sutekh, standing on the head, are found on the scarabs.

Beal was also sometimes identified with Set, or combined with Mentu as a war-god. Names compounded with Baal are sometimes found, as Beal-Ahathe (Hasten, 'Baal'), the Punie Maharab (Lap. jud. ii. 1, 5-6).

Reshpu, or Rezep, appears on some steles, wearing a pointed cap with a gazelle head bound on in front. He was a god of war, armed with spear and shield in the left hand, brandishing a battle-axe, and with a full quiver on his back (Wilkinson, Antiquities, ii. 5-6).

Anû, or Amanis, was a goddess of the Kheta (the Arjan Amantta, imported like Mitra and Varuna), represented as seated on a throne or on horseback, holding a spear and shield. Brandishing a battle-axe, she appears in that of a favourite daughter of Raûses II., Bânt-antba, 'daughter of Anûtis.'

Ashurthû, or Ashtarthû (Ishtar), was worshipped at Memphis, where is the tomb of a priestess of Ishtar. She is represented at Eden as lion-headed and driving a chariot. Rames called a son Menasrot, 'lover of Ashtaroth.'

Qadek appears as a nude goddess standing on a lion, her hair like the wig of Hathor, and lotus-flowers and serpents in her hands. She is placed with Min, and therefore seems to be a form of the Mother-god or Hathor; she has no weapons like Anûtis and Ishtar.

43. Tribal history in the myths.—Owing to the early age at which sculpture and writing began in Egypt, it is possible to trace the tribal history passing into religious myth. The worshipers of Horus expelling those of Set was recorded as history, and places retained the name ramâd as 'united to the Hûd' or Behdûtih, hawk-god of Eden, allies of the Horus tribe. Yet the whole of this also appears as mythology—Hermes warring on Set and driving him out of Egypt. As we see, on the earliest slate carvings, the standards of the tribes represented acting as the emblem of the tribe, breaking down fortresses, holding the bonds of captives, or driving the prisoners, so, by the same habit of symbolism, the god of a tribe was said to conquer another god when his tribe overcame another tribe. The contest of Poseidon with Athene for Attica and Troezene, with Helios for Corinth, with Hera for Argolis, with Zeus for Agrina, with Dionysos for Naxos, and with Apollo for Delphi, seems equally to mark the yielding of the worshippers of Poseidon to the followers of the other gods. This is an important principle for the understanding of religious myths, but it belongs to history rather than to the present subject.

44. Nature of the gods.—The nature of divinity was perhaps even more limited in the Egyptian mind than it was to the Greek. The gods were not immortal: Hâ grew old and decrepit; Osiris was slain. In the Pyrânid texts, Orion is stated to hunt and slay gods and to quench serpents. The gods can suffer, for Hâ was in torment from the bite of a magic serpent. The gods are not omniscient; they walk on earth to see what is done; it takes time for them to learn what has happened; Thoth has to inform Iâ about what he has heard, and cannot punish men without Hâ's permission. Nor can a god act directly on earth; he sends 'a power from heaven' to do his bidding.

The gods, therefore, have no divine superiority over man in conditions or limitations; they can be described only as pre-existent, as acting intelligence, with scarcely greater powers than man might hope to gain by magic and witchcraft of his own (cf. art. God, Egyptian).

See also art. Worship (Egyptian).

Literature.—The literature is given throughout the article, especially in § 6.

W. M. Flanders Petrie.

Elamites.—Introductory.—Elam, in Gû 10th, is said to have been the eldest son of Shem. The tract occupied by the nation descended from him is a portion of the mountainous country separating the Mesopotamian plain from the high country of Iran, including the fertile country at the foot of the hills. It is the Susis or Sussiana of classical
geographers (Strabo, xv. 3, § 12; Ptolemy, iii. 3, etc.), and was successively held by Assyrians, Babylonians, and Elamites. According to some Sumerian texts, Su-sin was the spiritual ruler of the Sumerian state.
Hodad (Assyr. Adad, Bab. Addu, also called Ramudanu or Rimmon) seems to have been known to the Elamites chiefly by his Mitannian (Hittite) name of Teshup, but the Assyr. list (Ona, Texts, xxiv. 40, 1, 4) gives the Elam. Nippur, equivalent to Kunzibani, compared by Scheil with the Bab. Kuzibu or Kuzibu, "abundant," or the like. With the Assyro-Babylonians he was not only the god of wind, adorer, and lightning, but also of fertilizing rain. Another Elamite name given by the same text is Sū ḫ iḫ išiṭ (ib. pl. 17, obv. 40).

Hunamun, Hunun, Ununum. As this is a very common deity in the composition of men's names, he must have been one of the most popular of the Elamite pantheon. According to Scheil, this name is, like others, of Sem.-Bab. origin, being composed of the name ḫ unu, and bar (from bānu, "to form or create")—i.e., a creator.1 Hamil of Aiapir speaks of "Hūban the great, god of the gods" (Scheil, iii. 103), and the same inscription has the divine name ḫ unananünkī, "Hūban the king." The Elamite Simut is identified by Scheil with Sumer, who appears first on the list given by Assurbanipal of Assyria, and is immediately followed by Lagamaru. As Nin-urrē is the name of Inuru, and is immediately followed by Lagamaru, Assyro-Babylonians. As two names are given in the same text, it is possible that both are the same. However, it is generally accepted that the two names are identical. At the time when the inscription was written, the Elamite god Napratip, who is mentioned in the inscription as a god of wind, adorer, and lightning, was known to the Assyrians as the god Adad, or Assur, the god of thunder. The Elamite god Simut, who is mentioned in the inscription as a god of wind, adorer, and lightning, was known to the Assyrians as the god Assur, or Assur, the god of thunder.

1. Noteworthy among the goddesses is Belūdua, who, as Scheil points out, is the Bēlūdua of Ashurbanipal, vi. 41. She is possibly the Bēlūdua of WAI ii. 60, l. 27, where the city which stands opposite her name is Uṣub. The nearest name in Sumer.-Bab. is Belīlī or Belīlī-alam, spouse of Āštīla or Aštīla-alam, the name of the male and female personifications of the heavens (Ann and Anatu). Belīlī appears as the sister of the sun-god Tammu, who was probably well known to the Elamites as to the Babylonians.

2. The Elamite name for "god" was nap, which was borrowed, to all appearance, by the Assyro-Babylonians. Whether there is any significance in the fact that nap is the character for "god" doubles, is uncertain, but, if admitted, its fundamental principle would seem to be dualistic—probably male and female. In Cun. Texts, xxiv. pl. 39, 1. 10, nap, as the name of a deity, is explained as anu šemū, "Enil of the heavens," the name of Enil being written with the character for "old"—as though the ancient.

Whether this root has anything to do with the Nāpiṭi, a group of deities (Scheil) to whom a temple was attached by Uri-Sagges, is uncertain. Scheil regards Nāpiṭi as being the Nāpiṭi of Assurbanipal, vi. 43, and prefers a Sem. etymology, namely, nāpi, "covering," "protecting," or "the little." The occurrence of Nāpirin, in the same text with Simu, "(protecting) mountain—" names which he quotes—seems to bear upon the Median mountain of Nīpur, where the ark was regarded as having rested, and suggests a reason for the temple named E-kura, "the house of the mountain," in the Bab. Nippur, as well as the similar list of native and foreign deities (WAI iii. 60, rev. 106) the apparently Elamite Nēpirī occurs, and is immediately followed by "Nergal of Ḫubud,"

3. Noteworthy among the figures of deities derived from Elam are the relics on the Babylonian boundary-stones of the Kassite period, by means of which the emblems on those monuments have been identified. It is now known that the emblem of Merodach was a spear—perhaps that with which he slew the dragon of Chaos; that Naksu was represented by a lighted lamp, similar to the Roman; that a stock terminating in an eagle's head was the god Zagrām (Zannum); that a seated female figure represented Gula; and that a thunderbolt stood for Addu or Hodad. A variant showing Merodach's spear-head surmounting a kind of house is the symbol of the god of the sun-god, Assur, as was嘘 presumed, apparently, with the name of the god GAN, confirming what has been said (p. 251) as to the identification of these two deities. The above, with other emblems, were probably used by the Elamites as well as by the Assyrians.

4. Concerning the Elamite gods, Assurbanipal, the Assyrian king, in his cylinder-inscription above quoted (tib. 1, col. vi.线条 27 ff.), gives some interesting details. The Nāpiṭi, or temple-tower, of Susa was built of enamelled brick imitating lapis-lazuli, the sacred stone of the Assyrian-Babylonians, and evidently also of the Elamites. This his soldiers destroyed, as well as the pinacles of bright green of the temple of the sun-god, Š zīnu, of the temple of the sun-god, Š zīnu, in which the god of the oracles dwelt (he states) in a secret place, and no one ever saw the work (workmanship, form) of his divinity. Six deities, Sumudu, Lagamaru, Partikira, Amman-kašpiar, Udurum, and Sapsk, were worshipped only by the Elamite kings, and (the statues of these, together with 12 others—Bagih, Sungum-sarā, Karsa, Kir-sams, Sulānu, Anapsa, Bīlālā, Panir-timmri, Sīla-gārā, Nāpās, Nāpirtu, and Kinkadarkār—were consecrated to the sun-god, Tammuz, as was probably well known to the Elamites as to the Babylonians.

Elders (Buddhist).—Certain members of the Buddhist Order took rank as elders, and, as such, had considerable weight in the management of its business, and in the preservation of the doctrine.

1. The term "elder" (therī) is occasionally used in its ordinary sense of such members of the Order as were of lowest standing in it (Aggutera, i. 78, 247). For qualifications of the term, see above (p. 253), and cf. the "Elam," in "HDB and EBD."
elders (Agg. ii. 22; no. 4 in this list, it should be noted, is the description of an arahant). The number of those who were thus entitled to be called elders is not given as very large. There is a frequently repeated short list of the most distinguished among them, the ‘elders’ or theras (therà-sīvaka). The full number is twelve, and their names usually follow one another in the same order. They are (1) Sāriputta, (2) Moggal- kimia, (3) Kassapa, (4) Kaccāna, (5) Khotițha, (6) Kāse, (7) Chāra, (8) Revata, (9) Uppali, (10) Ananda, (11) Itthaka. But the lists are not consistent. Sometimes one, sometimes another name, especially of those at the bottom of the list, is omitted; and there are slight variations in the order. It is quite clear that neither the number nor the names were fixed at the time of the earliest tradition (Viṇaya, i. 534-55, ii. 15, iv. 66; Agg. iii. 200; cf. Moggallāna, i. 212, 482).

In one passage (Agg. i. 22-25) we have a much longer and very interesting list of those members of the Order who were disciples (bhikkhū sīvaka), specifying after each name the good quality or meaning to which each seemed to have been pre-eminent. Forty-seven men and thirteen women are mentioned, and Buddhaghosa (q.v.), in his commentary on the passage, calls them all ‘elders’ or theras. Of course this may not recur in this list, and are said to be pre-eminent respectively in the following ways—that is, according to the order of the names given above: (1) in great wisdom; (2) in the powers of iddhi (q.v.); (3) in discussions as to extra-optional duties; (4) in power of expanding that which has been stated concisely; (5) in the fourfold knowledge of the texts—their philological meaning, the doctrine they contain, of the derivation of words and ideas, and, finally, in the power of extemporary exposition of them; (6) in ability in exhorting the brethren; (7) not mentioned; (8) in inward vision; (9) pre-eminent among those who dwell in the forest; (10) the best of those who knew the canon law; (11) the most distinguished among those who learned the texts, who were self-possessed, whose conduct was right, who had moral courage, and who were of service to others; (12) the best among those of the brethren who were willing to learn.

There is a touch of historical probability in the fact that twenty of these are members of the local Order at Kappāna, whose list of the title is found for no. 12, who was the Buddha’s own son, than he was willing to learn. And, when we notice that only one or two of the whole sixty in this list were among the first disciples to be admitted to the Order, it is manifest that to be a senior to them, we must conclude that the title ‘elder’ was more dependent on other qualities—such qualities as are given in the list, and in the passage quoted above—than on the mere fact of seniority in the community. Even in the Viṇaya (the Rules of the Order), in which, as a general rule, so much weight is laid on precedence by seniority, we find the word ‘elder’ (therā) used in this technical sense (Viṇaya Texts, i. 228, ii. 17, 61, 237 [SBE xii., xvii.]).

It is sufficiently clear how this happened. In the ordinary meetings of the local chapters administration of the Order, the senior bhikkhu present (reckoning not by age, but by the date of ordination) presided, and the members present were seated in order of such seniority. But, when it came to talking over questions of ethics and philo-
sophy, or discussing details in the system of self-training based on psychology and ethics, something more than seniority was required. A certain number of the brethren became acknowledged as leaders and masters in these subjects. Their brethren called them ‘elders’ and gave them a special title. For a formal appointment by the Order itself, or by any external authority; nor is there any evidence that a bhikkhu became a therā merely by age, or by seniority in the Order.

So far had this secondary and special meaning of ‘elder’ driven out the etymological meaning that it is the only one dealt with in Dhammapāla’s exposition of the word at the beginning of his commentary on the Thāṇā-gathā; and the unknown commentator on the Dhammapāda, in his explanation of the word at verse 261 (see above, note 1), actually derives therā, by a fanciful and exegetical, not philological, argument, from dīrava in the sense of ‘having moral courage.’ The canonical Bud-
dhism contained in the Pañta texts was called, in the tradition, the Therā-vāda, that is, ‘the opinion of the theras,’ where the word is again used in the secondary sense, and refers especially to the theras who held the First Council (see Childe, Pāli Dict., 1875, s.v. ‘Vāda’).

In one passage we find the phrase Saṅgha-therā, ‘the Order’s elders.’ Since, as we have seen, the writer has translated this (Viṇaya Texts, iii. 404) by ‘the eldest Therā (then alive) in the world,’ this is probably right, as the number of years of his standing in the Order is immediately added.

But it may also mean ‘the most distinguished and venerable of the then living theras.’ The Buddhist elders had no more authority in the Order than such as followed from the natural deference paid them for their character and accomplishments; and they had no other authority over laymen. Such slight discipline as was customary was carried out, not by the theras, but by the local chapters (see Discipline [Buddhist]). The theras, as such, had no special duties or privileges in connexion with the temporalities of the Order.

In medieval and modern times, the kings of Ceylon, Burma, and Siam have from time to time recognized some distinguished bhikkhus as Saṅgha-therā; and quite recently the English Government in Burma has followed their precedent, though it left the choice of the bhikkhu to be so distinguished to them, who were admitted senior to the other theras. It is still used, in those three countries, of any bhikkhu of distinction. There is still, as in olden times, no formal grant of the title. In other Bud-
dhist countries it has fallen out of use, and even in these three it is used mainly, though not exclu-
sively, when writing or speaking in Pāli. The modern native languages have other terms, such as nāyika, ‘leader,’ which tend to take its place.

ELDER (Semitic).—1. Connotation of the term. The importance of the ‘old men’ or ‘elders’ was a natural development of the authority of the head of the family, and of the reverence felt for parents and for the aged, primitive and primitive. Note the position assigned to Abraham, Isaac, and Jacob in all the documents of the Hoxanach. The reverence due to parents and to the aged is a favourite theme of both the OT and the NT (see e.g., Ephesians the Temanite is confident, because ‘with us are both the grayheaded and very aged men’ (Job 15:16); and in Sir 38:4 He that honoureth his father maketh atonement for the transgressions of the sons, etc.).

1 The same difficulty was felt when the theras presiding as a chapter had to recite the Pāṭimokkha. If he could not do so a junior bhikkhu, who could, took his place (Viṇaya Texts, i. 25).

2 So at Dhammapāda, verse 261, an elder is described as a man in whom is truth and religion, kindness, self-command, and training.

3 There is an anthology of verses ascribed to elders, both men and women, beginning in the case of the Therā-Sīvaka. It contains poems of 303 male and 74 female poets. There are also often mentioned in the various episodes in the other books, but most of them occur among the above 237.

T. W. RHYS DAVIDS.
Similarly in the Code of Hammurabi (e.g. § 195) severe penalties are prescribed for those who fail in respect and duty towards parents.

However, we have one of the many cases where a word in common use acquires a technical meaning while its ordinary meaning still persists, so that a difficulty may arise as to whether it simply means an old man or an 'elder' in the technical sense. Very early there must have been many old men who were not 'elders,' although all 'elders' would be old. Later on, an 'elder' came to be used to designate a chief usually mature or elderly, not necessarily old. There might be 'sheikhs,' just as there are aldermen, in the prime of life; Presbyterian elders are not always old.

Amongst the nomad Arabs there is one supreme shaykh for a tribe, but there is also a Dinw, or council of shaykhs. In the OT, the 'elders' almost always, if not invariably, appear as a group or council; and the Heb. term zakān in the technical sense is used in the plural.1 Is 29:9 are not a technical exception even if zakān means 'elders' in these passages, for the word in each case is collective. Gn 24 (cf. below) seems a real exception; but possibly zakān here means 'senior' and not 'elder.' Ga 3:16 calls them your father, the shaykh, but this is unlikely in view of the stress laid in 44:9 etc. on the advanced age of Jacob.

In primitive society the head of a family or clan, like the captain of a ship, would discharge many functions which are assigned to separate individuals in a more advanced civilization. He would be leader in war and peace, priest, judge, often the repository of, and chief authority on, tribal tradition, and possibly doctor. It is natural, therefore, that, as society developed, the title 'elder' or 'shaykh' was sometimes borne by various people in authority and by the members of different professions. Thus in the OT we read not only of elders of cities, tribes, etc., but also of elder of the 'elder' of Abraham's household (Gn 24:), of the elders of Pharaoh's household (Gen 50:), of the elders of David's household (2 S 12:4), of the elders of the priests (2 K 19:3, 1 S 22:17, Jer 19:). In later Judaism, zakān is a scholar or teacher of Rabbinical law, and the synonym šibh is used in the same sense.2 Amongst the modern Arabs 'shaykh,' or 'elder,' is used with a wide variety of meaning.3 It has, of course, the familiar meaning of leader of a tribe; the name is also applied to the heads of the great Muslim sects, to the magistrates set over districts of a city, and to the chiefs of various towns and industries, and even of thieves. A professional devotee, or 'saint,' is also called a shaykh, and the title is also borne by priests and schoolmasters, the title 'shaykh' being given to a female teacher.4

Thus the 'elders' or 'shaykhs' would be of very different degrees of importance. In the OT, where we nearly always find them acting in groups, and not as individuals, we have the elders of a district or city (2 K 21:), or of a tribe (Gilead, Jg 11:); Judah (2 S 19:4, 2 K 23:), and of Israel (1 S 4: etc.). If we may regard Soco as typical, the elders of a country town were fairly numerous, and probably included the heads of all families of any standing, for we read that in Soco there were 77 princes and elders (Jg 8:4).

Both the name and the institution of 'elder' or 'shaykh' were wide-spread; we find them not only in Israel, but with the Canaanites (Jos 13:4); Moabites and Midianites (Nu 22:); and at the Phenician town of Gebal (Ezk 27:). According to Winckler, one of the Amarna letters is from Itrakta, a Phenician city, and its elders.5 The available evidence suggests that the quasi-patriarchal authority or influence associated with the term is to be regarded as an early stage of social development. Robertson Smith, for instance, speaks of the senators of elders found in the ancient states of Semite and Aryan antiquity alike.6 Probably in some cases persons corresponding to elders or shaykhs bore titles not derived from a root meaning 'old,' more especially later, when 'elder' had become a technical term equivalent to 'chief' or 'counsellor.'7 Thus it is often suggested that the Cannanite noble, met with in Egyptian inscriptions, and referred to as marna, our lord, corresponded to the Israelite elder.

Nevertheless, the title 'elder' for a person of authority, learning, or other distinction continues to this day. The Ger. ye'el, seen in the OT, is still used by the Jews in Palestine, and is still used by the Jews in Palestine, and is still found in priests, prophets, and elders; and modern Semites still have their sheikhs.

On the other hand, it seems probable that various other titles are synonyms of 'elder'; we have already referred to the Syr. marna, and may note also the N. Sem. mlkh (see below). In Hebrew there are many titles more or less synonymous with zakān, and hence the interchange of terms in the narratives of Gideon and of the relief of Jabez-Gideon by Saul suggests that šēk in the sense of 'householder' or 'head of a family' may be such a synonym. Amongst the Arabs, heads of the clans (Nn 3:34); the 'prince' or 'captain,' nāṣir, the head of the tribe (Nu 24:); the chiefs or, lit., 'corner-stones,' of the people, panāth kālim (Jg 29:1, 1 S 140); and, in Ex 24:1 only, the 'qāta, 'nobles,' of the Israelites. Other terms for chiefs, rulers, officials, such as sārin, hōrām, sāgin, seem sometimes equivalent to 'elders.' Zikān is also coupled with šākūhim, 'heads,' šāqū'īm, 'judges,' šākū'im, 'officers,' to make up a description of the leaders (Dt 29:13, 1 S 30:). Probably these terms are partly synonymous.

But 'father' in such phrases as 'father of Tekoa' (1 Ch 29:4) means 'founder' rather than 'chief.'

2. History of the institution.—In early times, e.g., in Israel in the nomadic and pre-monarchical periods, the position of the elder corresponded with that of the sheik amongst the modern Bedawin. He was the head, or one of the heads, of his family, clan, village, or district; the leader in war; the chief counsellor in war and peace; the arbiter in disputes; but his power was moral, and depended on the respect of his personality; he could advise but not command, persuade but not coerce.8 As Doughty says, 'The sheikh of a nomad tribe is no tyrant'; 'the dignity of a sheik in free Arabia is commended by more than his authority.'9 According to Doughty, the office of supreme sheikh descends by inheritance. McCarney, however, quotes authorities to show that the office was rather elective, seldom remaining in the same family.

ELDER (Semitic) 265

family for four generations. No doubt customs differed; the application of the hereditary principle would depend upon the qualifications of the heir, and it would sometimes be modified by election within a given circle. Thus, amongst primitive nomads, the elders or sheikhs represented three different kinds of influence or authority: that of the fathers or head of the family—paternal; that of age or reputed wisdom—personal; that of a legitimate government—official. These three were not necessarily modified in the same persons in the more advanced and complex social order of agricultural and city life; the title 'elder' attached itself often to the office apart from age or hereditary right. At the same time, the status and character of the elders were not always or altogether changed by the abandonment of nomad life. McCurdy states 1 that the habits and relations of the old patriarchal life were not discarded in the permanent institutions of the fixed settlements. The influence of the patriarchal system can be traced in the establishment and regulation of the Semitic cities; and we may find there a reproduction in type, if not in detail, of the essential elements of the old tribal organization. Through what N. J. N. N. 2 has termed the simple constitution of the city or State included a head, malik—a name corresponding with the Heb. melēk, 'king'; a circle of nobles or 'great men,' and a general body of the common people. The malik and the 'great men' were usually hereditary. As the word malik in Aramaic is lit. 'counsellor,' McCurdy suggests that the malik was originally the chief elder of the clan which founded the settlement. We have already pointed out that the title 'elder' persisted through the whole course of Jewish history; and it is a familiar fact that, within certain limits, the patrimonial authority was equally persistent.

Nevertheless, the changed conditions gradually modified the social life. The family remained the unit, but the group of families, the kindred, the clan more or less gave place to the community of the district, village, or town. 3 The fixed home, the regular cycle of agriculture, involved a more stereotyped social life, a greater authority on the part of the local chiefs. In Israel, for instance, as we have said, the elders appear in groups, each group forming the ruling council of a district, city, tribe, or even of the nation. Apparently, local government always went hand in hand with the elders of the community. Whether, with the development of society, there was a differentiation of offices; and other notables—priests, judges, military leaders—shared the authority of the elders. In Arabia, there is sometimes the bālūṭ, or judge, side by side with the sheikh.

The rise and increase of the royal power further limited the authority of the elders, by the interference of the financial, military, and judicial activity of the king, his ministers and representatives. We may summarize what can be gathered from the earlier documents as to the elders in Israel under the 'judges' and the monarchy.

In the history of the Exodus in J, 4 we frequently meet with the 'elders of Israel' or 'of the people,' as associated with Moses in the leadership of the people, or as intermediaries between him and the people (Ex 3:16; 18:22; 19:3; 19:19 etc.). In Ex 18:20 [E], Moses, Aaron, and all the elders of Israel entertain Jethro; and Moses by his advice appoints heads over the people, rulers of thousands, rulers of hundreds, rulers of fifties, and rulers of tens. It is not clear how far we have here an organization and supplementing of the elders, or how far this is meant to be a more expedient, partial, and perhaps, in Nu 11:15-20. 5 (from an early source not certainly identified), seventy elders are associated with Moses in his prophetic inspiration. There is no mention of elders in E's code, the Book of the Covenant (Ex 20:19-20), but they are 'judges' (Ex 18:25-26) associated with the 'elders of Israel' or 'of Judah' at intervals throughout the history (Jos 7:2; 1 Sam 4:1; 1 K 8:1). In D, Dt 27:1; Ezk 14:3 during the Exile, Ezr 6:8-14, 1 Mac 12:54, and 18:25-27, we have them connected with the high priest (cf. Mt 21:24). The members of the Sanhedrin were called 'elders,' z'kenim. 6

This body of 'elders of Israel' exercised great influence in the early monarchy; they command the army (1 S 4:4), demand a king from Samuel (8), and confer the kingdom (2 S 5). They are less prominent in the later monarchy, power falling more and more into the hands of the royal ministers and officials (1 K 4), but become important again in and after the Exile; and, finally, the Sanhedrin claimed to represent the 'elders of Israel,' more especially the 'seventy elders' associated with Moses. In the 3rd cent. A.D., N. Jobanan says that the members of the Sanhedrin, the Beth-din, must be 'tall, of imposing appearance, and of advanced age; and they must be learned, and must understand foreign languages as well as their own.'

We have seen that, over against the 'elders of Israel,' we have the local elders of a city or district, who are the local authorities of whom we have heard. For instance, the elders act on behalf of Suceoth (Jos 8:31) and Gilad (11). In the legislation of D the elders are prominent as the local authorities; they deliver up the murderer for punishment (Dt 19:5); they represent their city in the ritual for the exportation of a wayfarer by an unknown hand (21:22); the disobedient son, the wife charged with inidelity, and the man who refuses to marry his deceased brother's widow are brought before them (21:18-20; 25:7). After the Exile we have the 'elders of every city,' in Ezr 10:4.

On many points we have no express information as to the elders. We are told nothing as to their qualifications, and very little as to their rights, privileges, authority, or duties. Probably throughout the history the local elders were the heads of the leading families; but it is not clear who the 'elders of Israel' 7 were. 'Elders of Israel' may have implied a gathering of all the local elders, and in practice a gathering of such as were able or inclined to be present on a given occasion. If so, the elders of a district would usually be represented in proportion to their proximity to the place of meeting. If we read anywhere of the elder or sheikh of a town or district, we might think of the 'elders of Israel' as being made up of such district elders, but the latter do not appear in our documents. It is, nevertheless, possible that the 'elders of Israel' formed a national council with a comparatively small number of members, each with a definite official status, acquired by inheritance, or some principle of selection or election.

As to number, the Sanhedrin (q.v.) comprised about seventy, perhaps because seventy elders are mentioned in the account of the Exodus; but these are seventy out of the elders (Ex 18:20); implying that the total was much greater (Ex 24:1, Nu 11:18). Seventy-seven 'princes' and 'elders' are mentioned at Succoth. 8

Probably the authority of the body of elders, whether local or national, was largely of the same undefined character as that of the sheikh of an

**ELECTION**

Arab tribe (see above). It was liable to be set aside by that of the king or any leader of an armed force, and it depended largely on the personality of the elders and the extent to which they represented public feeling.

A combination of our various pieces of evidence, Babylonian, Israelite, Arab, etc., suggests lines of development which are probably typical for the Semitic people generally. We have first the shaikh or shalikhs of a nomad tribe, then the elders of a town or district in a settled community. These furnish in some way a council of elders for an entire State. In a more advanced stage of social development, the influence of the elder is subordinated to that of royal and other officials, but the elders long persist as a local institution, and recover much of their importance in such crises as the Captivity of Israel. On the other hand, the term 'elder' or 'shaikh' sometimes lost its original meaning, and came to be used for a chief of any kind.

**ELEATICS.—See PHILOSOPHY (Greek).**

**ELECTION.**—1. Definition.—Election is a purely religious idea, originating in an interior necessity of the spiritual life, as the natural explanation of the source of Its saving impulses. The movement in the soul against sin is directly traced to a cause supernatural to the sinner. Righteousness is never an ordinary thing, or a common privilege that may be ranked beside others. It is laid to the responsibility of God, whose peculiar work it is. And, as it is of His inception, its continuance and successful fruition likewise are by His agency. It began with Him, and He will perfect it, by that faithfulness which, if it be too strong to describe it as 'irresistible grace'—the compulsion of sovereign might—is indeed the pertinacity of unwearied love, of strong, wise, unerring Fatherhood over erring, weak, and foolish childhood. This is the very nerve of the doctrine of election. The stages of its working are identical. The free return of man to God springs from the passionate communication of God to man. Election is the antecedent to revelation. Election is the opposite of predestination (q.v.), with which it is at times confused. The terms are not synonymous (for election, Heb. עָבָּד, Gr. ἀπολύτης; for predestination, עָבָּד, עָבָּד, ὀπολυτῆς), nor is their connotation identical. The idea of predestination runs through Scripture, if that idea be understood in the sense of the all-controlling, all-creating activity of God over and in and through all things, but it is in no respect so central and essential to the revelation of His redemptive purpose as the idea of election. They are, however, closely related. Predestination has reference to the all-embracing, comprehensive design of the Divine in all its work—creation, providence, salvation; election refers to the special application in redemption. Again, while predestination and election embrace speculative and religious contents, they retain them in different proportions; predestination is the more speculative, election the more religious. The problems of the former arise first in the reflecting stages of religious development, when an answer is required to the question, 'How is the human soul related to the universe?' Election is not due to the philosophical instinct; it is an affirmation of the religious consciousness, expressing its certitude of the Divine, and therefore objectively valid, foundation of its religious experience. It meets the interior anxieties of the soul for saving assurance. The discussion of predestination belongs to theodicy, of election to dogmatics. Further, the doctrine of election is Biblical and theistic. It occupies a foremost place among the works of God in the OT and the NT. It derives its meaning and force solely from the system of revelation they record. It is grounded in the insistent conviction of the saved soul that salvation is derived from God. It is inconsistent with assumptions, which deny His personal agency, and which denies His personality and the beneficent character of His relation to men. It implies the reality of man's alienation from God, His sinfulness, His inability to work out his own salvation, and looks to the mercy of God to manifest a way of escape from sin and of return to Himself in reconciliation. It is thus also the presupposition of His gracious operation in the hearts of those who believe and clasp holding Him as their Rock.

2. Systematic statement.—(a) The systematic presentation of election may begin with its source in the Divine love. God is Love. Love is His nature. It is to be viewed not so much as one of His attributes—it is the one quality concerning which it is predicated of God that He is (1 Jn 4:8)—but rather as the Divine constitution in which all the attributes are combined. It is the substance of His character, regulating the relationships within the Godhead. It is also regulative of His relation towards His creatures, including mankind. It is possible to trace God's righteousness, faithfulness, mercy, and justice to love as their foundation and essence. Wherever this is the case in the Divine nature appears unending and love is viewed as an attribute, all other attributes must be regarded as reconcilable with love. Whether essence or attribute, the love of God is the fountain of His electing grace. On the former hypothesis, it is more manifestly so; on the latter, God's love is liable to be subordinated to His glory identified with His righteousness or holiness, and a moral severity, inspired by ideas most arbitrarily sovereignty, justice, and mercy, is infused into His gracious acts, so absolute as to rob them of tenderness, compassion, and beneficent efficacy. Where this procedure is followed, the election is, as a rule, that of the Divine sovereignty—the Calvinist tendency.

Although, under stress of criticism, every suggestion of caprice or arbitration is properly excluded from the idea of sovereignty, and its exercise is asserted to be conditioned by the Divine Attributes, it is, nevertheless, the case that love is considered by Calvinists, the more speculative, election the more religious. The problems of the former arise first in the reflecting stages of religious development, when an answer is required to the question, 'How is the human soul related to the universe?' Election is not due to the philosophical instinct; it is an affirmation of the religious consciousness, expressing its certitude of the Divine, and therefore objectively valid, foundation of its religious experience. It meets the interior anxieties of the soul for saving assurance. The discussion of predestination belongs to theodicy, of election to dogmatics. Further, the doctrine of election is Biblical and theistic. It occupies a foremost place among the works of God in the OT and the NT. It derives its meaning and force solely from the system of revelation they record. It is grounded in the insistent conviction of the saved soul that salvation is derived from God. It is inconsistent with assumptions, which deny His personal agency, and which denies His personality and the beneficent character of His relation to men. It implies the reality of man's alienation from God, His sinfulness, His inability to work out his own salvation, and looks to the mercy of God to manifest a way of escape from sin and of return to Himself in reconciliation. It is thus also the presupposition of His gracious operation in the hearts of those who believe and clasp holding Him as their Rock.

*This is usually regarded as the genuine reading.*

1. Calvin's phrase, as it was Augustinian's.

eighty is more judicial and retrenchive than gracious and salutary, on this view, as Calvinism yet offered an adequate rationale of the origin of election. It seeks refuge in the nature of God to look for God's universals reasons for His acts in a sphere inapposable to human understanding—... He has sufficient reasons secret to us. Doubtless; but that is reasoning on abstract principles, and not on actual precedent, His manifested nature and character. The Scriptures give its reasonings of the nature and whiteness of God is exhibited as revealed in its highest exemplification in redemption, wherein He seeks to win sinners from their depredity to His holiness and happiness; and Himself supplies the means whereby they attain those blessed ends. In that work mankind is called to exalt the power and wisdom and goodness of God, and to our advantage. They are not merely the institutions of the electing and the reprobating powers; the new reformation were to be traced to the name of Jahweh (Ex 34). Israel's God was never a reflection of the national spirit; the national spirit received its impress from His image. Jahweh was the framer of Israel, and the mould in which He casit was that of His own nature. Its institutions had little in them that was personal; what gave them meaning, transfiguring them and rendering them serviceable media for conveying Israel's formative influence, was anterior to them—the revealed name of their God. Corresponding to Jahweh must be a judicious estimate of the holds the existence of a soul to continue. His ascension is the due consequence of His resurrection. It provides the means enabling God to surrender His resentment. It leads to His self-sacrificing effort to regain men, and through His own effects, a better state of man's heart. The desire issues from love. That love is conditioned by nothing in the object or its relations; it is a universal, unerring in operation. Holiness is its content. But holiness enters in to hold it to the right thought of what is to be imparted, and to the right means of imparting it. The Divinity and right of expresseness are not antitheses, and need no reconciliation; they spring from the same root. In the Divine love, Calvinism has high merit in having vindicated God's love, as the source of election, against the claims of man's works or faith; for grace is God's gift. All alike inordinate gift of God's love is met. But Calvinism falls in its analysis of the Divine nature. Modern theology here abandons the idea of the sinless and sinning seen in the dispensation of grace something higher than a dispensation of justice; and, in the glory of God for which it works, the good of His creatures; and of course personal and fundamental content, a holy compassion, whose most imperious necessity is to seek the salvation of all mankind (2).

(b) The idea of election is progressively unfolded in the history of redemption. It includes both the history and the prophecy of OT. The story of the Hebrews is the story of Divine grace striving against human sin. It begins with the promise of restoration made to primitive man after his fall (Gen 49). The solemn occasion of Abel's sacrifice over Cain's (4), and the rescue of Noah from the Flood (ch. 6). It takes more definite shape in the calling of the patriarchs, Abraham (12-13), Isaac (33-36), Jacob (46), and Joseph (45-46)....

A fresh stage was introduced by Moses. He laid the foundations of a civic and religious polity, creatory of a sense of corporate or national individuality, based on the election of Jahweh by His chosen people. A new covenant was established, with the objects of life established by a new and a more exalted conception of God's name. The ritual and moral ordinances were designed to educate this consciousness. They imparted a unity of feeling and sense of benefit and of responsibility—beneath and within themselves, for they were merely the institutions of the electing and the reprobating powers; the new reformation were to be traced to the name of Jahweh (Ex 34). Israel's God was never a reflection of the national spirit; the national spirit received its impress from His image. Jahweh was the framer of Israel, and the mould in which He casit was that of His own nature. Its institutions had little in them that was personal; what gave them meaning, transfiguring them and rendering them serviceable media for conveying Israel's formative influence, was anterior to them—the revealed name of their God. Corresponding to Jahweh must be a judicious estimate of the holds the existence of a soul to continue. His ascension is the due consequence of His resurrection. It provides the means enabling God to surrender His resentment. It leads to His self-sacrificing effort to regain men, and through His own effects, a better state of man's heart. The desire issues from love. That love is conditioned by nothing in the object or its relations; it is a universal, unerring in operation. Holiness is its content. But holiness enters in to hold it to the right thought of what is to be imparted, and to the right means of imparting it. The Divinity and right of expresseness are not antitheses, and need no reconciliation; they spring from the same root. In the Divine love, Calvinism has high merit in having vindicated God's love, as the source of election, against the claims of man's works or faith; for grace is God's gift. All alike inordinate gift of God's love is met. But Calvinism falls in its analysis of the Divine nature. Modern theology here abandons the idea of the sinless and sinning seen in the dispensation of grace something higher than a dispensation of justice; and, in the glory of God for which it works, the good of His creatures; and of course personal and fundamental content, a holy compassion, whose most imperious necessity is to seek the salvation of all mankind (2).

1 Cf. Fairbam, Christ in Mod. Theol. 3, 1894, p. 400: "the essential gradation of His Being and the necessary graces of all His acts."
the hope of earthly prosperity is transformed into yearning for the blessings of the inner life of love and faith. 

ELECTION

The hope of earthly prosperity is transformed into yearning for the blessings of the inner life of love and faith. 

Election comes to its perfect expression in Christ. Historical in Israel, it becomes personal in Christ. The NT teaching derives its special features from His, and Its teaching founds itself on the OT development. We may summarize it so: 

1. Election was God's choice of Israel as His people. 
2. Election was purely of His grace (De 32, Ps 106). 
3. Election was extended to all people. 
4. Election was the basis of the Church's present and future existence. 

The nature of election is in conformity with the nature of the Kingdom, viz., election into a common life under one rule. It is a universal Kingdom; the choice is made by God, not by man. 

Election is in conformity with the nature of the Kingdom, viz., election into a common life under one rule. It is a universal Kingdom; the choice is made by God, not by man. 

Election is the pattern and exemplar of it. 

He is the Elect One (Lk 6:22), with whom, He is the Elect One (Lk 6:22), with whom, 

He is the Servant of the Lord, He is the Servant of the Lord, 

He is the Elect of God (Lk 4:25), and He is the Elect of God (Lk 4:25), and 

Those who are the true elect (elected, electo), for whom the Kingdom was prepared from before the foundation of the world (25:30); for God knew the sufferings of the last times; whose prayers He hears, whom He knows, and who are to rejoice because their names are written in heaven. 

To give the Kingdom to them is the Father's good pleasure. They prove themselves the elect of God, that they are obedient to the call of Christ. 

The origin of their faith is carried back to the eternal counsel of God. 

This faith itself originates not so much in their own receptivity as in the work of God and power of God. The process of their election is their continuous discipleship, referred, like its inception, to the will of God, not only in purpose, but in fact, these are in election. 

In all the foregoing no attempt is made to solve the implicit difficulties; the knots are there, not for solution, but for understanding. The future of St. James, by finding the result of Christ's work is due to Divine cause: those come whom the Father gives, those who do not come to Christ are the children of the devil. Again, those who come are those who love the truth and those who do not love darkness. All, i.e., that happens here happens in human freedom, yet under Divine causality. According to St. Peter, election fulfills itself in sanctification of spirit (1 P 1:21); in 1 P 1:28 representation seems indicated; the ethical condition of disobedience is not to be excluded). St. James sees Christians to be what they are by God's election, begetting by the word of truth, and working in them faith, love, hope (1 Th 1:2-3; 2 Th 1:2-5). 

The kernel of the Apostle's teaching is to be found in Ro 5:20 (rather than in 8:11), where election is the strongest assertion of assurance. Amid the anxieties of the age, the believer is not to be dismayed, since to those whom God loves, and who are His elect, all things work together for good—His elect, all things work together for good—

the deepest thoughts of God, who foreknows and foreordains; and whom He foreknows and foreordains He calls, justifies, and glorifies. It is a pure triumph-song of faith, declaring its own eternal salvation for its own comfort and strengthening. 

In the other locus classicus, Eph 1:4, the ground of election is God's good pleasure and free grace; its aim the holiness of the elect and their standing in the adoption of children. According to Eph 4; election accomplishes itself by incorporation into the one body, the believing community, which is effected by the acceptance of the Gospel. In the Pastoral the Apostolate is ordained to work faith in the elect. In other Epistles the assurance of election is confirmed in the conceptions of it as a prophetens eris alhers, and as being bound up with the world-plan. The ideas throughout are moral, not theoretical, the call of God, the human response to it, the statement of present experience and undeniable personal conviction that the action of God, the protection of God, and the purpose of God are upon the believer, within him, and around him, going before him and preparing him into the eternal issue. It is a thought in entire harmony with the general doctrine of the NT. 

Humanity is fallen, incapable of saving itself by its own forces, and can be redded not only by the power of grace, but salvation is offered to all. Its determining cause is the free decision of the individual. Its condition is faith in the gospel. God confers on man the power of the work of Christ, believing this presentation. Unbelief arises from neglect of the use of the means of grace. There is, at this point, a moment of determinism in the Pauline doctrine.
ELECTION

Man is so fast in the bondage of sin, so turned towards evil, that God's Spirit must accompany the word to produce saving faith. The Apostle thus asserts both election and man's liberty. He makes no attempt to reconcile them. Was the message urged in its higher reaches of his thought. The religious life to him was, in its last analysis, a rhythm of life within life, in which desire determined the flow of gifts from the including greater to the included because God meets man in the many phases of his shadowed mind, and gives Himself or what is like as man will receive; and, as He gives, the inner springs of man's self are touched, yielding the secrets of freedom and faith. The God-possessed life is the self-possessing life. Of the mechanism of the soul that sets itself against God, St. Paul had no experience: he could not describe it. Still less could he posit a decree of reprobation to explain it. In the case of the sole rejection he knew— that of the Jews—the casting away was temporary, and to be wrought against. Even so it might fare with evil, when its meaning should be taken up into the meaning of the whole. This is his history, while playing a real part, should be known as but an episode in the history of good.

From the foregoing we deduce these three assured points: (1) God's ideal Son, who is the Mediator of the Divine life, the bestower of the Divine Spirit, the express image of the Divine Person; (2) the ideal community, the elect race, the chosen body, which is to exhibit the virtues and graces of the Son; (3) Jesus, preordained in the eternal counsel to be the agent of its election, its Head, Lord, and Christ, through whom God calls, begots, and sanctifies the elect. In the Person, Work, and Church of Christ the many-sided forebodings and hopes of the OT find fulfilment. The correspondence of the fulfilment with the prophecy is not forced. We see the great lines of thought of the history and prophecy proceeding to an unknown, unimaginable end, and in the NT meeting in Christ in a wholly new combination, the spring of fresh forces and larger hopes for mankind. It is the consummation in Life of what was prepared in the OT.

If the Divine purpose is to be read in the light of its evolution, can we justly speak of non-elect? The term has no warrant in Scripture. Has the import of the following considerations may be deemed relevant: (1) Election is always of the universal many; (2) Election is neither in the OT nor in the NT rigorously restricted to the elect body; other nations besides Israel do work for Jehovah in the execution of His redemptive purpose—as, e.g., Egypt, Cyrus, etc.; similarly in the NT in every nation he that feareth God (Acts 10) and 'all nations of men on all the face of the earth,' concerning whom God 'hath determined the times before appointed, that they should seek the Lord, in the days of his power, that by grace you might be justified and have your sins remitted.' (2) The Christian hope is universal, 'not for us only, but also for the whole world' (1 John 2:2, cf. Tit 3:11, Tit 2:13). (3) The Christian hope is the only hope of men, all the face of the earth, concerning whom God 'hath determined the times before appointed, that they should seek the Lord, in the days of his power, that by grace you might be justified and have your sins remitted.' (2) The Christian hope is universal, 'not for us only, but also for the whole world' (1 John 2:2, Tit 3:11, Tit 2:13). (4) The prophecy of 'a dispensation of the fullness of the times' (Ephesians 1:22) is not limited to the church, but ultimately shall be reconciled to God, is an idea including the redemption of physical nature, with the destruction of suffering and death; the redemption of human nature, with the destruction of sin; and the redemption of the world of angels, with the destruction of the spiritual forces opposing themselves now to the Kingdom. (5) Although there is a limited to absolute universality of salvation, the case of many in Christ, not in God's counsel. Intimations of impossibilities occur, but these are not referred back to God's ordination; they arise from the condition of the spirit of men themselves. To the wicked God shows mercy—giving time and place for repentance. All shall be made alive who can be. If it should be that God's judgments pass from a disciplinary stage to a penal stage in the history of those who are the subjects of them. A degree of non-election is unthought of (in Rom 8, Eph 1, the reference is to believers only). Election is to life. And the life of the elect is the life of faith, but all are not receptive; what then? The problem is not solved. God wills all men to be saved. But all are not saved. Is the Divine will then frustrated? An intractable residuum in human nature is contemplated. Before it does God's resourcefulness fail? There will be a restitution of all things. Can it tolerate on its borders a queenless Gehenna? The antimony is left—a position acceptable perhaps to the practical religious mind, but perplexing to the reason. The final relation between the elect and the reprobate, and between the reprobate and God, is unknown. There is no experiential material on which to construct; and God's process is unassimilable. Conscience, not intellect, adjusts the problem.

The well-known chapters 9-11 of Romans are best understood as a parenthesis, touching of a very special kind of thought. The theme was a burning problem to the Apostle, hence the length at which he treats it. Its argument is wholly apart from his general experience, in line with the problem of election in the Christian teaching. It reminds us of St. Paul was a Jew, 'learned in the traditions'—as an apostle was a Christian. His arguments are these: (1) The recognition of the absolute sovereignty of God; the Jews who rejected Christ and those who accepted Him both made their respective choices in subjection to the Divine appointment. (2) This Divine election was for a certain definite purpose; the believing Jews, whom God, it was thought, the Gentiles might obtain the salvation that was through Christ. (3) The blinding thus inflicted upon a portion of the Jews was temporary, and the Gentiles for which this Divine appointment had been made, the ban would be removed; through the ministry of the Gentile Christians the unbelieving Jews would be converted to the true faith and all Israel would be saved. The absolute result was sure; if any it was because they did not make their calling sure. That this line of thought on election had its exponents in the Jewish schools may be felt in the Book of Wisdom (cf. the interesting essay by Einar Grafe in Theod. Abhandlungen Carl von Weizsacker curtus, Freiburg, 1893). "Double predetermination" is affirmed, but whether in the Augustinian or in the Calvinistic sense is another question. The Apostle's object is to set forth a wider election-doctrine than that of the Pharisees (cf. Corr. Romans, 99, Is; Sandy-Hoadlam, 'Romans,' in ICC, 1896, ad loc.), and to reduce every notion of national pride. He has not in view either the relation of God's election to freedom or the "double predetermination." 3

3. Subsequent theological reflexion.—Until the time of St. Augustine this is neither profound nor precise. Patristic thought is unspeculative. It is pervaded by a strong practical sense which shrinks from theoretical problems suggested, but not solved, by the Apostolic teaching. The mental attitude of the Fathers is determined by a close adherence to the received sacred pronouncements, and by the endeavour to repel whatever in contemporary culture appeared plainly contrary to them. In their view the unit of election tends to be the individual destiny, but the redeemed race. Again, their point of departure is not the decree of God, but the believing experience of the saved. Moreover, personal election being a matter of personal faith—faith's assurance of its own eternal worth—it cannot conjoin with itself any assertion of reprobation, since that can be no element of faith. That Jesus, in other words, has no other object than the election of His Church, that the Church lives to bring the world to God—these are the primary contents. Both the Greek and Latin doctors maintain the Divine sovereignty, man's liberty, and the reconciliation of both in God's foreknowledge. Differences first appear in the meaning attached to those doctrines; and the

1 Not necessarily understanding of man's merit. The question was not seriously discussed.
meanings emerge in their particular cast from alien prepossessions, e.g. in the East from philosophy, in the West from law. The Greek divines, influenced by the universalist strain in St. Paul's teaching, formulate a more genial concept of the world than the Latin adhering to his determinist strain, dominate man's will by God's sovereignty.

Tertullian is an exception. He unites with the Alexandrians in a view of the will which elevates it into an independent faculty, having 'freedom in both directions,' knowing both good and evil, and able to choose between them. This is not St. Paul's doctrine; he asserts of the will simply freedom from conflicting motives. East and West alike inculcate a doctrine of synergy according, to which the renewal of the soul is the result of two factors—Divine grace and man's freedom. But what is the part taken by each factor? Does the mercy of God take the initiative, or the will of man? Does the exertion of man's will precede the Divine aid? In what sense is the will free? In creating the world the East enlarges the range of human freedom, and accords saving merit to man's effort. In harmony with such positions, election is a pre-ordination of blessings and rewards for such as are foreseen to be obedient. There is no foreknowledge of sin, although there is foreknowledge of it. Justin Martyr is strenuous in repudiating Stoic fatalism. Men, he affirms, have it in their power to cast off sin by exerting their will. With Irenæus sin in men and angels is a free act. Why some fall and others do not is a mystery. There is no interference with human freedom. The blindness in those who reject the Gospel is the result of their own will, and is the usual expression less in relation to the Apostle's system of doctrine than under personal predilections.

With Augustine the whole subject assumed new and far more complex forms. His doctrine has little historical background. It was mostly a new creation from a new standpoint, drawn not from earlier Christian sources, but from the ideas he had imbulfed from his philosophical studies operating on the convictions of an intensely awakened conscience. The secret of Augustine lies in his inner growth. To appreciate aright his contribution to Christian philosophy, two considerations must be kept in view—the peculiar spiritual discipline, and the subordination of his reason to his faith. His philosophy, if he has one, is ancillary to his religion, which is real, positive, and profounding in its own way, on a level, as such, as in the monistic and antitheistic, offers unceasing suggestion, and is to be interpreted in its spirit and method rather than in its immediate content. The self-consuming, self-encircling, and confusion which resulted from his doubts and despondency, and from the secular catastrophes of his age, there were two truths that continued to cast an unceasing weight on his mind—a conviction that the human mind—Amissa in the universe, and that a Divine mind embraced the whole in an all-seeing vision. How reconcile this inarticulate perversity of a world with the being of God? The two foci of his 'system' are a monistic doctrine of unity and the theory of original or Adam's sin. The world is but the manifestation of God; God's own immediate will is the sole cause of all things. In the view of God's eternal knowledge the natural man is evil, wholly depraved, morally insufficient, and helpless, from the identity of the race and Adam (so tremendous an effect is attributed to the Fall): 'the will has power indeed for evil but not for good, except as helped by the Infinite Good.' Original sin is the basis of predestinating election. The whole human mass was so justly condemned in the apostate root that, were none rescued from that damnation, none could blame God's justice. Those who are rescued are rescued gratuitously; those who are not only show what the whole lump, even the rescued themselves, deserved, had not undeserved mercy succoured them (Enchirition, 99; cf. Ep. exciv. 6, 8). If the will of man turns to good, that is due to gracious Divine efficaciously predestining man. The regeneration is purely the work of grace. Grace is efficacious and irresistible; its action on the soul is the result of direct Divine agency. Only those predestinated to eternal life are regenerated; they are also endowed with the freedom of grace which is indestructible. They are the elect. The elect are few in comparison with the non-elect (a doctrine attributed to Scripture, and confirmed by observation); yet those thus disposed are to be considered the benefit of the former. Election is not grounded on foreknowledge of human faith or conduct; no account is given as to why some are elected and others not; there must be two classes to manifest the Divine grace; the elect are predestined, not the non-elect, the latter are in the process of corruption there passed two acts of the will of God—an act of favour and grace, choosing part to be partakers of everlasting glory; and an act of justice, forsaking the rest and adjudging them to endless perdition; these, vessels of wrath, those, of mercy.' There was no positive and efficient decree of any to eternal death; the decree of God was simply to leave the wicked in the state of perdition to which they had come. Augustine teaches preterition.

The Augustinian doctrine depressed several positions hitherto unexamined and initiated a controversy of unequalled influence throughout the medieval period, and which at the Reformation still interested the intellectual world. God as Will, an act of grace and an act of justice, a cause and not inalienable in its own constitution; grace as controlling, sanctifying, human effort; and the logical sequences of the concepts of absolutism in God and determinism in man—these ideas fill the horizon of the Middle Ages, partly by way of attraction, partly by repulsion. The strict Augustinian argument is well sustained by such theologians as Gockel, Aquinas, Bradwardine, and others, who stress the Divine grace, and at times teach the twofold predestination. The doctrine of merit is represented in such commanding minds as Iohannes Mercator, John Scotus, Etgenus, Duns Scotus, etc. The dominant point of view, however, is seen in Aquinas, who founded upon merit in the strict sense of the term as the effect of grace, and grace as the effect of predestination. He argues with Augustine that the reason why grace is rejected is man's own fault—not so much the ground of the existence of sin's guilt, but on account of his disinclination to grace by reason of original sin. The rejection in the faculty will of the race and not in the choice of the individual.

Throughout the period the controversy shifts its base from the sound facts of experience, and its net results are a less value for the idea of election than for that of predestination. Logical considerations are the determining factors. Little of practical import accrues. The modern world tacitly settled down to an absolute view of original sin; the doctrine of predestination is not reexposed, but on account of his disinclination to grace by reason of original sin. The rejection in the faculty will of the race and not in the choice of the individual.

Various hypotheses as to the connection of electing grace and man's free will have been ad-

The phrase 'liberum arbitrium' is due to Tertullian.

2 As, e.g., 'Whom he did foreknow he also did predestinate' (Rom. vii, 22); 'Whom he will he will hardeneth' (Is.); 'Jacob have I loved, Esau have I hated' (Gb).
vanced by Roman divines, and only those of the Jansenists have been condemned. The general current of opinion has been against unconditional election, in favour of synergism. In the Reformation against the Gargantuan tempests, the要不要二十一; at first more faithfully with Luther and the Lutheran Church in its subjective view. The present is more than both Lutherans and Reformed unconditional election has been abandoned. Yet synergism has not won fresh credit. Pelagianism, it is universally felt, has been finally refuted. God is sovereign, and man is free; both truths are to be retained, as Augustine blunderingly argued. The path to their reconciliations, according to modern thought, is to be found in a less juristic and more moral conception of Divine sovereignty, and in a less indistinct and more determinate theory of the human will. Present-day mental science, even with the help of the doctrines of heredity and environment, has not succeeded in rendering more determinism cogent to the modern mind. In so far it helps to confirm the belief of the bulk of the Christian Church in all ages that man's destiny is in his own hands. It prevents us equally from any ascription of predestination in its extreme, personal sense. Election in the sense of our circumstances and surroundings being made for us and not by us—this is simple and obvious enough. But if that is not the necessary result of our circumstances and surroundings the plain testimony of our conscious life. That conscious life which speaks saying, 'Thou oughtest,' makes a no less certain echo within, which says, 'Because I ought, I can.' That 'can' aside and is not constant ever, however enfeebled it may become. The social pressure may as a matter of fact be made subservient to its increase: since social coercion, if it be reasonable, is a condition of moral robustness. Similarly man's independence is secured in dependence on God. The essence of freedom is self-surrender to the Divine will.

LITERATURE.—There is a very large literature on the subject, in the majority part of which 'election' and 'predestination' are used interchangeably. A copious bibliography will be found at the end of the following treatise, The Doctrine of Predestination, Election, and Grace. London, 1889. Every modern writer on NT theology and every commentator on 'Romans' and 'Ephesians' deals with the subject—largely by way of simple exposition. The two most notable writings of the modern period are Thomas Emerson, The Doctrine of Election, London, 1877, and Schiefler, Lehrte von der Erwählung, Berlin, 1886. A. S. MAEITIN.

ELEMENT.—See ATOMIC THEORY.

ELEPHANTA.—Elephants are an island on the W. coast of India; lat. 18° 56' N.; long. 73° E.; about 6 miles from the city of Bombay, and 4 from the mainland. The native name of the island is Ghārāpurī, which has been interpreted to mean 'city of purification,' or, in the form Gārāpurī, 'city of purgation.' The Portuguese gave it the name of Elephanta, from a life-sized figure of an elephant, hewn from an isolated mass of trap-rock, which formerly stood in the lower part of the island, not far from the usual landing-place. This figure fell down many years ago, and was supposed to have disappeared; but it was discovered in 1864, and was removed to the Victoria Gardens, Bombay, where it remains in a poor condition. The elephant had originally a small figure on its back, called by some a young elephant, by others a tiger (Yule-Burnell, Anglo-Indian Gloss., s.v. 'Elephanta'). Another image, that of a horse, which once stood S.E. of the Great Cave, has disappeared. The island is famous for a splendid series of rock-cut temples. Their design is from being influenced by local tradition, were excavated by the Pāṇḍava heroes of the Mahābhārata epic, while a still wider legend attributes them to Alexander the Great, to whom some of them, as belonging to a great and ancient structures, even in parts of the country which he never reached in the course of his invasion. Fergusson, comparing them with other works of the same type, assigns their construction to the 10th cent. A.D.; Burgess dates them earlier—in the latter part of the 8th or the beginning of the 9th century. There is said to have been an inscription over the entrance of the Great Cave, which, if discovered, would probably date the date and the name of the king under whom they were excavated. This slab, according to Diogo do Conto, the Portuguese annalist, was removed by local men; but, if it ever existed, it has now disappeared.

The temple in the Great Cave is, like all Brahmanical rock-temples in W. India, dedicated to Śiva; and, according to Stevenson, it belongs to the Smārta school, that is to say, it is now, or perhaps ever, inclined to believe that it may be older than the present sectarian divisions, and that it was excavated when all the Saivas held nearly the same doctrines. In all there are six caves, of which four are fully or nearly complete; the fifth is almost entirely filled up, and the sixth is supposed to have been intended merely to provide cells for hermits. The most important of all is the Great Cave, which, excluding the porches and back aisle, forms an irregular square of about 9½ ft. in both directions. This contains that striking piece of sculpture, a colossal bust, known as the Trimūrti, or 'trinity' ('trinity' being an inappropriate expression for this Hindu combination of gods), which stands at the back of the cave, facing the entrance. It undoubtedly represents Śiva as the supreme deity; but there has been much difference of opinion as to the designation of the three faces. That in the centre is probably Śiva, the creator of the universe; or, as some say, Brāhma, who, according to the legend, sprang from the left side of Siva to create the world. That on the left of the spectator is believed to be the Vedic Rudra, in later times identified with Siva, the Destroyer. The third face is that on the right of the cave, a head with a gentle, placid, almost feminine look; and, though generally, and perhaps rightly, regarded as that of Siva in the character of Viṣṇu, has by some been identified with Pārvati, the śakti, or consort, of Śiva. Like many of the Elephanta sculptures, this group has been badly mutilated, even in recent times, by thoughtless or mischievous visitors. It has now been placed under the protection of a guard. Enough, however, remains to show the wonderful beauty and dignity of the sculpture. On each side of the recess in which the Trimūrti stands are figures of the giant wanderers, minor gods on their promotion, who act as protectors (devārapalā) of the god. The shrine (garbha) of the temple contains in the centre a base, or altar, in which is the lingam, or phallic emblazon of Śiva. Eulogies of this Śiva, cut from a stone of harder and closer grain than that out of which the temple has been excavated.

This plain stone, the mysterious symbol representative of Śiva as the male, or active, or production, or creator, or the passive in nature—as the yoni, or circle in which it stands, is of the passive or female power—in the land of the temple, the central object of Śiva, or to which everything else is only accessory or subsidiary (Burgess, p. 9).

In the compartment east of the Trimūrti is a
group of many figures surrounding a representation of the famous Siva, Lokesvara, half male and half female, known as Ardhanarîśvara, accompanied by Vîṣṇu riding on the bird Garûda (whom Ferguson would connect with Assyrian beliefs), Indra, and Brahmâ, who are here represented as attending upon Siva. The arcing compartment on the west side is occupied by Siva and Pârvatî, the mountain-goddess, his consort. The figures are not really nude (which is a Jaina rath) but a Brahmânical habit, the drapery being carved in the conventional style, which represents only the thicker folds and hems.

Passing to the west porch, we come to the famous group of the marriage of Siva and Pârvatî, who here represent the primordial pair from whose union the fertility of the soil and the increase of the human race, cattle, and crops are assured. The scene, unfortunately now much damaged, seems to depict the meeting of the bridal pair, accompanied by Brahmâ, Vîṣṇu, or Sûrya, the sun-god, the mother of the bride, and Sarasvâtî, the goddess of eloquence, who blesses the union. Following this scene is a reintegration of Siva and Pârvatî in Kailâsâ, the paradise of the celestial mountain, under is the ten-faced Râvana, king of Lanka or Ceylon, whose exploits are recorded in the Râmâyâna. Opposite the marriage of Siva is one of the most remarkable scenes in the caverns in the face of the principal figure indicative of rage, the lips set, with tusks projecting from the corners of the mouth. This has usually been considered to represent Vira-hadra, one of the Siva incarnations (avatâra). It is more probably BhîshmA, the reincarnation of the poet Rûdra, who seems to be derived from the non-Aryan demonology—one of the most common objects of worship among the Marâthâ people, by whom it is also known as Kapalâbhyt, 'skull-wearer,' or Mahâkâla, Time personified as the Great Destroyer. In this aspect Siva was worshipped by the Kapalâkî sect, naked mendicants who wore skulls round their necks, and drank from a cup formed out of a human skull (see Asmont). Farther on, Siva is depicted performing the Tanđava dance, which he does in the character of Bhûtasvâra, "lord of ghosts and goblins," haunting comets, and also as that of Cakrâkaras, attended by troops of imps, trampling on rebellions demons, heated by drink, and followed in the dance by his spouse Devû—another example of the absorption, in the main, of non-Aryan elements in the innumerable Aryan devil-worship. Here he also appears as Mahâkâla, the 'great, ascetic,' his image closely resembling that of Buddha, with whom this side of his cultus was doubtless closely connected. Burgess (p. 41) explains this as due in part to the circumstance that the Brahmanas excavated their cave temples in imitation and rivalry of the Bhâtanjas. The Bhûshana or Bandha ascetics wore yellow robes, and in imitation of them probably the Shiva Yogis and mendicants adopted tawny-coloured clothes. Buddha was regarded by his followers as the Great Ascetic, and this may have tempted the early Shivaism to give prominence to a similar characteristic in the representation of their favorite object of worship.

The second rock-temple has been injured, and little of the sculpture remains capable of description or identification. The third temple is still more dilapidated. In the fourth there were, according to Diogo do Conto, two images of Vetâm, lord of demons, and of Chandî, or Dûrgâ in her naked aspect; but these have long since disappeared. The temple contains Saiva festivals, and a fair is held at the feast of the Sivarâtrî, or 'Siva's night,' on the 14th of the dark half of Mâgha (about the middle or end of February). It is a fast, observed by day and a vigil by night, and there is celebrated the worship of the Lingam.

LITERATURE.—The literature connected with Elephanta is voluminous. The best account of the place, on which this article is largely based, is that of J. Burgess, The Rock Temples of Elephanta or Gharâbhir, with excellent photographs by J. H. Sykes (Bombay, 1874; 2nd ed., 1887); reprinted, with numerous illustrations, in 1875. This is accompanied by a map of the island on a great scale. For Siva and Pârvatî, the mountain-goddess, his consort, see: Feyer, New Account of E. India and Perâs (1809), p. 125; Ovington, Voyages in S. India (1816), p. 156; Green, Voyage to E. India (1823), p. 289; Ives, History of the Continent of India (1773), p. 42; Nieuhof, Voyage in Arabie et dans d'autres pays circinniant de l'Orient, p. 422; The Mem. of M. the Draper, was being carried in the conventional style, which represents only the thicker folds and hems.

ELKESAITES.—The adherents of a form of religion having baptism as its leading feature, which arose c. A.D. 100, probably in trans-Jordanian Palestine. It was intended to mark a renewal in Judaism, and was originally a Jewish sect.

I. The literary traditions.—The sources of our information regarding the Elkiesaites and their founder are far from abundant.

Enesius (III 8 63) speaks of the 'perversion of the Elkiesaites' as something quite ephemeral in character, and quotes from a shortly before the death of Nestorius (c. 430) as a passing reference to the proceedings of Elkiesaites missionaries, to their sacred book, and to their offer of remission of sins. For any definite knowledge regarding the sect, as well as for light upon its not wholly insignificant history, we are entirely dependent upon the heretical literature of the Elkiesaites.5 The principal work narrates the doings of the Elkiesaites Alchibads in Rome, while the latter reconstructions of the Elkiesaites propaeganda in Syria; but to both writers we are even more indebted for their extracts from the Elkiesaites book of revelation. This document was known to the Alchibads themselves. It contains references to dimensions which is quoted by both, the reduction of the Oriental measures into Roman feet is given by each in identical terms. The copy of the work which Hippolytus used was that which Alchibads had taken to Rome. But, in fact, written by Alchibads himself in the style of Nesius, the condition of the MS. was such that both Hippolytus and Erasmus were now and again compelled simply to guess at the construction, with the result that mistakes have crept into their accounts. But its references and quotations are in the main of sufficient character as to give us some idea of the book was not a large one, and that hardly anything of real importance in it has been lost. As yet, however, the task of using the fragments as materials for a connected history of Elkiesaites and his work has never been taken in hand, and there is the aim of the ability of a fresh text to do this good.

In connexion with the various points dealt with in what follows, cf. Hippolytus, Philostratus, Euseb. (Refutatio omnium heresim), i. 13-17, ii. 15. (Miller, pp. 192-207, 208: Epiph., Hier. xix. xxx. 17, iii. (pp. 40-44, 141, 397, 641); Euseb., H. c. 32, 329); the account given by Theodoret (Hist. Pol. ii. 7) is wholly dependent upon these other authorities, and contributeth nothing to the elucidation of the obscure points. The Arabic record of the Mughâlas (see above) are given in the original, with a German tr., by Chwolson, Die Staatsver. der Sasaniden, ii. 454, and by G. Flogel, Münch. Gesellschaft's Forschungen, Leipzig, 1865, pp. 48, 84, 133.

(2) The name.—The Elkiesaites are so named from an Aram. formation which the Gr. tradition represents as φιλοχαίτος (Hipp.) or φιλεκάτος (Epiph.). The second element of this word may quite likely be a transliteration of Aram. 'hîth.' As yet, however, the task of using the fragments as materials for a connected history of Elkiesaites and his work has never been taken in hand, and there is the aim of the ability of a fresh text to do this good.

In connexion with the various points dealt with in what follows, cf. Hippolytus, Philostratus, Euseb. (Refutatio omnium heresim), i. 13-17, ii. 15. (Miller, pp. 192-207, 208: Epiph., Hier. xix. xxx. 17, iii. (pp. 40-44, 141, 397, 641); Euseb., H. c. 32, 329); the account given by Theodoret (Hist. Pol. ii. 7) is wholly dependent upon these other authorities, and contributeth nothing to the elucidation of the obscure points. The Arabic record of the Mughâlas (see above) are given in the original, with a German tr., by Chwolson, Die Staatsver. der Sasaniden, ii. 454, and by G. Flogel, Münch. Gesellschaft's Forschungen, Leipzig, 1865, pp. 48, 84, 133.
of the Mughtasila (baptists of the Egyptian), viz. אֲשֶׁר, as read in the manuscripts of Kitab al-
Fārist, concludes the aspiration of the first letter, and therefore also the derivation of ṣa from ṣ, 'power.' The Arab spelling, in fact, seems rather to imply the transliteration of the original expression as ṣayyin, 'hidden God.' Still, as the Arab name bears no vowel-signs, and also lacks the diacritical points without which the last three consonants cannot be exactly pronounced, it may be pronounced in various ways, and its real meaning may have been something quite different. The conventional form 'Elkesai' makes its appearance for the first time in Theodoret, who derived it from Origen's Exe-
drais; this, again, is a variation of Exeouas, and the form Exeouas gained currency only through a confusion between the name of the sect and the surname of the prophet Nahum, וּפְרָש, of which it is the regular Gr. transliteration in the LXX.

A view that has received considerable support is that the name 'Elkesai' applies to the sacred book itself, and not to its author at all. But there are sound grounds for accepting this theory, which, moreover, involves a quite useless distinction. As we shall see presently, there was a real personality behind the book.

(8) The Book of Elkesai.—Tradition affirms that Elkesai held the possession of the verses—as a book of revelation—from the very outset of his career, but it gives widely varying accounts of the means by which he obtained it. The Elkesaite mission, which with whom Origen was acquainted are said to have held that it fell down from heaven. Another account—or perhaps two—was inserted by the above-mentioned Aleibiades in his own copy of the work, immediately before the text, which began with the chapter describing a vision vouchsafed to Elkesai. Hippolytus decried as much of this inserted note as he was able, and reproduces it thus:

'The righteous man Elkesai received the book from Sera [or Serai (a city or 'the heroes,' i.e. the Chinese)] in Parthia, and entrusted it to one named Sobai, as having been revealed by an angel, he who was twenty-four ephyes in height, six in breadth, etc.'

On this we would remark that the original writer of the note obviously did not know how the book had come into existence, and that his fictitious statement was intended to give interest in the work, on the principle that curiosity plays most assiduously around things of remote origin; while, again, the phrase 'revealed by an angel,' so far as regards the modern Greek writer, merely represents an idea in the mind of Hippolytus himself, who thus sought—unwarrantably and wrongly—to connect the statement of Aleibiades with the vision recorded in the text of the book: probably a few words at the end of the note were illegible.

Apart from these prefatory lines, and a few passages subsequently interpolated or reinserted, the book undoubtedly owes its existence to the founder of the sect. But it would, of course, be altogether wrong to suppose that the founder delivered no fresh oracles (commandments, directions about ritual, predictions, etc.) while engaged in dis-
sminating his teachings and governing his ad-
herents. The deep veneration accorded to his descendants at a later day goes to show that in his lifetime he had acquitted himself among his intimate disciples as a man of God, while many features of his book point so clearly to the speaker's conviction regarding his Divine call as a prophet that it is impossible to believe other-
wise. But we are not disposed to press his work in the light of this idea, and take into ac-
count not only their dictation but also the diversi-

fied character of their matter, we come inevitably to the conclusion that the Book of Elkesai came into existence by some such process as subsequently took place in the case of the Qur'ān, i.e., by piecing together the separate sheets on which the pro-
phet's utterances had from time to time been tran-
scribed. After Elkesai's death his followers could fall back upon the written record, and could pro-
mise salvation to all sinners 'as soon as ye hearken unto this book'; but, while he will live, he must assuredly have insisted—as did, of course, also his disciples—upon submission to himself as Diviney inspired. The theory that the prophet, as occasion arose, uttered his oracles, command-
ments, decisions, etc., which were then written down upon separate sheets and circulated among his followers, is that which best accords with the contents of the extant text.

2. Personality and work of Elkesai.—As regards the life and personality of Elkesai, all that the literary tradition tells us is that he was a pro-
duct of Judaism, was regarded as a righteous man, and announced the new dispensation and remission of sins in the third year of the Emperor Trajan. We learn, further, that the Essenes and Ebionites accepted him, i.e., either the man him-
self as a prophet, or, at a later period, his dis-
inctive teaching. But the appearances, reminiscences, and other citations from the sacred book give us so definite an impression not only of his doctrines, but also of his personality and his labours, that we are able in many cases to reconstruct the attendant circumstances without great risk of error.

(1) Doctrinal and ritual.—Elkesai required his adherents to practise circumcision, to observe the Sabbath, and, in general, to live according to the Jewish Law. He also sanctioned marriage. It is probable that the prohibition of flesh-eating ascribed to him, perhaps erroneously, by Epi-
phanios extended only to participation in the sacrificial meals of the heathen. He insisted strongly on the practice of turning towards Jeru-
salem in prayer, and forbade that of praying towards the East—an injunction meant, no doubt, for the heathen, and perhaps also the Essenes among his followers. He believed in the One God of Judaism and in the Last Judgment. He also shared the Jewish belief in various classes of angels, and believed that God dwells with the stars in the northern region of the sky.

Elkesai was not a learned man. The extant fragments of his book show not the slightest evi-
dence of his having studied the Jewish Scriptures. He imagined that he was proficient in astrology, and he had heard of the elements of which the world is composed; but in these things likewise his knowledge was of the scantiest. In an astro-
logical passage of his book the days 'when the moon travels past, or in the same path with them [the stars of the north],' are designated 'days of the dominion of the evil stars,' on which accord-
ingly no task should be done, though this dominion was the Sabbath. But the third day was also evil: 'when another three years of the Emperor Trajan have elapsed . . .' war would break out among the ungodly angels of the north, and a con-
vulsion of all ungodly kingdoms would ensue. The prophet had, of course, the Roman Empire in his mind, and, as the catastrophe did not take place, this unfounded prediction is a positive corrobora-
tion of the truth that Elkesai lived and taught before the end of the reign of Trajan.

The principal feature of the Elkesaite form of religious art was its practice of baptism. Elkesai pro-
claimed that the soul of the body—the garments being retained—in the waters of a river or a spring was the means whereby the Divine
ELESSAITES was his ecstatic, to appear, But, in He they is seven embrace Elkesai. true the this
remission of all sin was to be appropriated. That which other forms of religion sought to secure by sacrificial rites on areas as was effected here by the waters of baptism. The rite must be performed ‘in the name of the great and most high God,’ or [conjectural reading] with adoration of Him; and the candidate had to lie naked before his immersion, that he would henceforth abstain from all sin and all impiety in life and conduct.

Precisely the same ceremonial was to be observed when a demon or a venoms animal. Those who suffered from phthisis and those who were possessed with demons were ordered to immerse themselves in cold water, i.e. in a river or a well, forty times in the course of seven days; and, if they were unable to do this for themselves, the immersion had to be performed, and the requisite vows uttered, on their behalf, by others. This sacramental bath, as we interpret it, was designed to expel the demons and disease-spirits who seek to destroy the body. In all religions, no doubt, certain sacramental ceremonies, such as baptism, laying on of hands, being buried in the earth, &c., are believed to work similar effects on the bodily condition, but among the Elkesaites the belief was an officially formulated doctrine. One of their formulae for immediate effects of baptism, is the following.

But, as it contains a reference to ‘this book,’ i.e. the Book of Elkesai, and also gives the series of the Elkesaites ‘witnesses to the oath’ (see below) in a later transcription dating from a time when the Greek translation was about to appear, the rule in question has not come down to us in its original form.

We do not venture to affirm that the use of the sacrament set forth in this fragment was not appointed by Elkesai himself and first used in the community at a later date (see 2 K 213).

Elkesai must have instituted still another sacramental ceremony—of which, however, we hear only indirectly (see below)—viz. a communion with bread and salt. A ceremony of this kind, designed to ratify a covenant, was known among the Jews (cf. Lv 22, Nu 18, 2 Ch 13); it betokened fellowship at the same table, and thus expressed a solidarity of life or interest amongst the parties. In the Elkesaites celebration, however, the bread and salt must have been credited with magical virtues—beneficent in their nature, of course, yet capable of producing the opposite effects in the case of faithless or otherwise unworthy participants, just as with the water of the Christian Eucharist (1 Co 11).

The precise nature of the beneficent effects in the case before us remains unknown; the Contestatio Iacobi (in the [pseudo-] Clementine Homilies), cap. 6, reads like a reminiscence of the Elkesaites practice.

(2) The ‘witnesses to the oath.’—The Elkesaites practice of invoking the elements as witnesses of the baptismal vow presupposes the belief that the saving effects of sacramental rites might be changed into the opposite effects; it was supposed that they would prove fatal to those who took the oath falsely. Elkesai enjoined that such an invocation should be made at the celebratory services, the elements being called to witness the vow of a holy and upright life that had to be uttered, before immersion, by all desirous of securing the promised blessing.

With the ceremonial elements (bread and salt) he here associated those of the cosmos, to which mankind must likewise look as the source not only of blessing but also of the worst of evils. Elkesai knew of the central element, that of the cosmos, water, fire, air, and ether, as enumerated in the teaching of the Greek schools from Aristotle’s day. In his ignorance, however, he substituted for ‘air’ its most palpable manifestation, viz. wind, or the wind. ‘Earth,’ again, he interpreted as ‘the earth,’ and maintained according that the heaven likewise should have a place among the elements; while, to balance this addition, he rejected fire, which, from its association with sacrifice, he was unwilling to admit into his scheme. The ceremonial and advocacy before his immersion, that he would henceforth abstain from all sin and all impiety in life and conduct.

(3) Personality of Elkesai.—The baptism of Elkesai alike in its object—the remission of sins—and its preliminary condition—the pledge of a changed life—reminds us of the mission of John, the Baptist. But there was little in common between the two men. It is true that, in the earlier period of his career, Elkesai, like John, believed in an impending convulsion which would dissolve the existing order and which furnished no ground for believing that he expressly set before himself the task of teaching repentance to his own people and arousing their conscience.

The general conception of the Baptist (as, e.g., which he gives a reason why fire should not be trusted, and why water is better) scarcely suggests the impassioned propagandist. With perfect composure of spirit he enjoins that proselytes—his converts from heathendom—had first of all to embrace Judaism—shall not be baptized on the Sabbath. He looked for success not to some sudden thrill of emotion which predictions of woe would excite among the people, but to the approval which those who believed in a Divine retribution would accord to his teaching. He thus counted upon the convincing power with which his declarations and arguments, instinct as they were with the note of assurance, would impress all who were prepared to listen to them with a serious mind. As one who received revelations, he must have been an ‘ecclesiastic,’ but he was no less a man of practical judgment, with a clear eye for ways and means.

On the other hand, Elkesai did not lack that inner experience which forms the dynamic of all outstanding personalities in the religious sphere. We have an evidence of this in his secret written word, which, with the Christian Eucharist (1 Co 11), the precise nature of the beneficent effects in the case before us remains unknown; the Contestatio Iacobi (in the [pseudo-] Clementine Homilies), cap. 6, reads like a reminiscence of the Elkesaites practice.

(2) The ‘witnesses to the oath.’—The Elkesaites practice of invoking the elements as witnesses of the baptismal vow presupposes the belief that the saving effects of sacramental rites might be changed into the opposite effects; it was supposed that they would prove fatal to those who took the oath falsely. Elkesai enjoined that such an invocation should be made at the celebratory services, the elements being called to witness the vow of a holy and upright life that had to be uttered, before immersion, by all desirous of securing the promised blessing.

With the ceremonial elements (bread and salt) he here associated those of the cosmos, to which mankind must likewise look as the source not only of blessing but also of the worst of evils. Elkesai knew of the central element, that of the cosmos, water, fire, air, and ether, as enumerated in the teaching of the Greek schools from Aristotle’s day. In his ignorance, however, he substituted for ‘air’ its most palpable manifestation, viz. wind, or the winds. ‘Earth,’ again, he interpreted as ‘the earth,’ and maintained according that the heaven likewise should have a place among the elements; while, to balance this addition, he rejected fire, which, from its association with sacrifice, he was unwilling to admit into his scheme. The ceremonial and advocacy before his immersion, that he would henceforth abstain from all sin and all impiety in life and conduct.

(3) Personality of Elkesai.—The baptism of Elkesai alike in its object—the remission of sins—and its preliminary condition—the pledge of a changed life—reminds us of the mission of John, the Baptist. But there was little in common between the two men. It is true that, in the earlier period of his career, Elkesai, like John, believed in an impending convulsion which would dissolve the existing order and which furnished no ground for believing that he expressly set before himself the task of teaching repentance to his own people and arousing their conscience.

The general conception of the Baptist (as, e.g., which he gives a reason why fire should not be trusted, and why water is better) scarcely suggests the impassioned propagandist. With perfect composure of spirit he enjoins that proselytes—his converts from heathendom—had first of all to embrace Judaism—shall not be baptized on the Sabbath. He looked for success not to some sudden thrill of emotion which predictions of woe would excite among the people, but to the approval which those who believed in a Divine retribution would accord to his teaching. He thus counted upon the convincing power with which his declarations and arguments, instinct as they were with the note of assurance, would impress all who were prepared to listen to them with a serious mind. As one who received revelations, he must have been an ‘ecclesiastic,’ but he was no less a man of practical judgment, with a clear eye for ways and means.

On the other hand, Elkesai did not lack that inner experience which forms the dynamic of all outstanding personalities in the religious sphere. We have an evidence of this in his secret written word, which, with the Christian Eucharist (1 Co 11), the precise nature of the beneficent effects in the case before us remains unknown; the Contestatio Iacobi (in the [pseudo-] Clementine Homilies), cap. 6, reads like a reminiscence of the Elkesaites practice.

(2) The ‘witnesses to the oath.’—The Elkesaites practice of invoking the elements as witnesses of the baptismal vow presupposes the belief that the saving effects of sacramental rites might be changed into the opposite effects; it was supposed that they would prove fatal to those who took the oath falsely. Elkesai enjoined that such an invocation should be made at the celebratory services, the elements being called to witness the vow of a holy and upright life that had to be uttered, before immersion, by all desirous of securing the promised blessing.

With the ceremonial elements (bread and salt) he here associated those of the cosmos, to which mankind must likewise look as the source not only of blessing but also of the worst of evils. Elkesai knew of the central element, that of the cosmos, water, fire, air, and ether, as enumerated in the teaching of the Greek schools from Aristotle’s day. In his ignorance, however, he substituted for ‘air’ its most palpable manifestation, viz. wind, or the
majority of his followers from their ranks. This seems to be implied by the concluding words of the lines prefixed to the copy of his book used by Hippolytus: words to the effect that the author had entrusted the work, as a revelation, to a certain man, No. 3 (i.e., the man who would relates the facts here); and further, in the marginal gloss, υπό της τόλμης is—apart from the terminal vowel, which is wanting—an exact transliteration of the Aram. ｇｂ’Ale’a’yah, which is the passive participle of a verb signifying ‘to stain,’ ‘to wash,’ and also ‘to bathe’; and, as a distinction of voice in the Greek, the last of these mean ‘the bathed,’ ‘the baptized.’ This term, then, as it was found in the prefatory note regarding the book, i.e., regarding its actual contents, the utterances of Elkesi himself, may be taken as indicating that his earliest adherents were not of Jewish race, but heathens who had submitted to the proselytic baptism of Judaism only in order to secure the salvation proclaimed by him. His injunction against baptizing proselytes on the Sabbath proves beyond question, indeed, that he not seldom gained accessions from the ranks of heathenism.

(b) The Essenes.—Among the Jews the sect of the Essenes was the acme of all the Jewish ascetic communities. From the time of the Jewish war this group of zealous baptists had settled in the district to the east of the Jordan, where they had opportunity to follow up their extreme asceticism with an astute and well-sustained argument. Elkesi’s teaching was in many points akin to their own. Burnt-offerings had already been discarded by their fathers, even while the altars of the true God were still burning at Jerusalem. It is likely enough, too, that a belief in astral deities would prevail in a community which worshipped the sun at his rising. Whether the Essenes abandoned that worship in compliance with a general injunction against turning to the East in prayer, we do not know. That in their other prayers they observed the gībālā towards Jerusalem may be inferred from the fact that they had been in the habit of sending dedicated offerings to the Temple.1 Nevertheless, they must have in some degree maintained their distinctive character and their separate existence as a community, else Epiphanios could not have spoken of the remnant of their adherents in his day as a definite group among the Essenes.

(c) The Jewish Christians.—The teaching of Elkesi found an open door also among the Jewish-Christian communities whose language was the Aramaic, the existing representatives of the earliest churches founded by the Apostles of Jesus and their associates—the recollection of the baptism preached by the forerunner of Jesus would still be of some influence; and, moreover, their long-protracted waiting for the Savior’s return from heaven, as well as their disappointment that one ‘sign of the time’ after another had proved abortive, must inevitably have tended to predispose them to welcome a new revelation. With a view to winning their whole-hearted allegiance, Elkesi circulated among them a document in which he related how there had appeared to him two figures of monstrous size, a male and a female, facing each other like a pair of statues; the male was the Son of God, the female was the Holy Spirit.2 In order to gain credence for this story, he averred that the figures—of equal magnitude—stood between two mountains, and that he was thus enabled to ascertain their dimensions: they were twenty-four χόρδαν high (nearly 36 ft., i.e., about 10½ m.). He also took care to represent the vision as a token of God’s approval of himself and his work, stating that these beings are invisible to man, and had manifested themselves to him only by way of exception. The story was quite in keeping with the religious notions of these Jewish Christians. The ‘Gospel’ of the Nazareans in Berœa, according to Origen and Jerome, contains in substance some of these words: ‘My mother, the Holy Spirit, took me by one of my hairs, and conveyed me to the top of the lofty mount Tabor.’ In any case the imposture—we can call it nothing else—was successful. Epiphanios maintains that the ‘Napœtæn,’ like the Essenes and the ‘Nazareans,’ were imposed upon by the heresy of Elkesi; and, while this statement does not apply to all Nazarenes or Jewish Christians, we can quite well believe that a large proportion of the pre-Catholic Christians of Syria, and especially those occupying the district to the east of the Jordan—probably it was the latter only who as yet called themselves Epiphanios, ‘the poor’—yielded their allegiance to Elkesi. In a later age the Catholic Christianity of the East surrendered in similar fashion to Islam, and with less excuse. Cf. art. ENOISM.

(d) The post-Elpasian career of Elkesi.—Elkesi had thus become the hierarch of a confraternity which, if it did not count its members by tens of thousands, had nevertheless a considerable influence, and probably a wide influence, in Syria. Presently he had, of course, to deal with the cares and troubles incident to a position like his. The members of his communities came to him with their grievances. As Jews, they were subject to the tyranny and chicanery of special taxation; as monotheists, who would not bow to the gods of the State or the statues of the Emperor, they were exposed to persecution of all sorts. Elkesi, willing to save them from such persecutions, issued a further document to his faithful followers, permitting them in the last resort to deny their faith with the lips, while still loyal to it in their hearts. So long as they withheld their inward assent, it was no sin, in times of persecution, to worship idols, to take part in the sacrificial meals associated with such worship, and, in short, to renounce their religion in words. Elkesi vindicated this policy by adducing the example of a Jewish priest called Phinehas, who, during the Babylonian captivity—under King Darius in Susa—was saved from death by an act of homage to Artemis.

When we bear in mind that this was a case where a religious leader of strongly self-reliant character granted to others an indulgence which promised no personal advantage to himself, we cannot but see in the action a certain humane consideration and a high degree of tolerant kindliness. But leniency in religious things is not what we look to find in the founder of a sect—not, at least, until the closing stages of his career, when the fires of enthusiasm are quenched and the mind has attained to peace. We may thus venture to surmise that this dispensation was Elkesi’s last proclamation—the message of a man no longer young, whose sole remaining wish was to prove himself an attentive shepherd to his flock, and leave among them a legacy of gracious memory. Are his people persecuted? Be it so; let them heed the word of the ungodly, and the devil. In the great Day of Judgment it is his leader’s testimony that will count. He, Elkesi, will then bear witness, on behalf of his faithful ones, that their denial was but make-believe, not the expression of their inmost thought. It must have been in some such frame of mind and with some such conviction that he issued his permission to deny their faith.

It is probable that this dispensation in its original form included an instruction which Hippolytus wrongly interprets as referring to the whole book. The instruction is in these words:

2 We must remember that the Semitic mind quite naturally represented the Holy Spirit as female, the Semitic equivalent of spirit being feminine.
from which he quoted a commandment requiring that after cohabitation a man shall bathe often, and in his clothes also, and those who had been bitten by a venomous animal, directing them to bathe in water and invoke four pairs of names, these being compiled from the two lists of the seven Elkesiates' witnesses' (Harr. xxx. 2. 17, p. 141 ff.)

(3) The Elkesiates mission to the West.—About the year 220 of our era a group of Elkesiates in the Syrian littoral who possessed the Greek version of their sacred book, were of a spirit so vigorous and enterprising that they sought scope for it in an attempt to propagate their doctrines in other parts of the Roman Empire. They proposed to send missionaries to the West, and that these should appear to the Catholic clergy as adherents of the book, to the members, asking them to hearken to its message and assent to it, and should then, on condition of their doing this, invite them to undergo initiation for the purpose of dividing, in one chapter of the book in particular they placed no small reliance, as it seemed to be precisely of such a character as would dispose the Christians to look favourably on the book as a whole. This was the Christological section, which, if only that, might not go further than the Greek version, and which contained the doctrine that Christ had appeared often in the course of the world's history.

Epiphanius confesses that he did not fully understand the passage in question, and that, in particular, he could not make out whether the Christ spoken of was the Lord Jesus or another. Finally, or rather, as an act of supplementation, he added a short note connecting—on quite fallacious grounds—the figment of the two gigantic forms with a certain doctrine of Jewish-Christian gnosti. according to which Christ was the Adam created in Paradise, and in his several advents simply represented for the time the body of Adam, as required in the other hand, says explicitly that the Elkesiates Christology proceeds upon the Pythagorean idea of transmigration, and actually quotes in this connection a word (εξωπρόφητος) associated with that doctrine. But, when he tells us that in the Christological teaching of the Elkesiates Christ was said to have been 'born of the Virgin this time,' we feel that he is supplementing from his own creed, for this has been expressly stated in the document. Epiphanius could scarcely have had any dubiety in the matter, but would have known that by 'Christ' the Elkesiates meant the Lord Jesus.

From the remaining data of the two heresiologists, so far as they agree, we infer that the later Elkesiates Christology was somewhat as follows: Christ is a higher being, was fashioned in Paradise as Adam, and since then has been born—not merely once, as now, but repeatedly in the course of previous ages—in various personalities as a man like other mortals. But such a doctrine is hardly open to doubt in that the fragment under consideration it was implied that not only Jesus, but also Elkesai, was an incarnation of the Christ, and, indeed, that the latest and most notable manifestation of the great being was none other than Elkesai, not Jesus of Nazareth. Now Elkesai himself cannot have believed this, as he had made it known that the Son of God had appeared to him in a form of encod for prophecies. And it is much more likely that this fact was overlooked by the later generation of his adherents. The Christological section, as the present writer thinks, first saw the light at the time when the Elkesiates—in Apania or in other places—were preparing for their book for their Western mission. The period and the locality both tended to favour the delusion that the Catholic communities would be satisfied with the faithful pious doctrine. It seems to have been at this time also that an addition was made to the directions for the sin-purging rite of immersion, the formula 'in the name of the great and most high God' being supplemented by the words 'and in the name of Christ.' The smaller interpolation was meant, of course, to serve the same purpose as the larger.

The apostles of the Elkesiates faith, thus fur-
lished with a revised edition of their book, then set forth to the conquest of Catholic Christendom. Orig, in a discourse directed against them, says that they ventured to approach the Churches. But they were quite unable to win a firm footing anywhere. Nor is this book wondered at, as the enterprise rested upon a wholly deceptive apprehension of the doctrines, the rites, and the general conditions of the Catholic world.

Our further knowledge of the undertaking is derived from the efforts of Alcicides, a citizen of the important town of Apamea on the Orontes, who directed the Elkesaites mission in Rome. He found the Roman Church in a condition that seemed altogether favorable to his designs, and he determined to take full advantage of the fact. Bishop Callistus (A.D. 217-222) had shown himself unwilling to exclude sinners from the fellowship of the Church, even for sins of the flesh, the usual penalty of which had been excommunication. It was asserted by his opponents that this leniency had caused the prevalence of precisely that kind of sins; but Callistus maintained that Christ forgave all who repents, and that, the second time in the name of the great and most high God, and in the name of his Son the great king, and purify and cleanse himself, and take to witness the seven witnesses recorded in this book: the heaven and the water and the holy spirits and the angels of prayer and the oil and the salt and the earth.

Again I say, of adulterers and adulteresses and false prophets (i.e. heretical teachers), if ye will be converted, that thereby your sins may be forgiven, so ye likewise shall have peace and a portion with the just, as soon as ye have hearkened to this book and baptized the second time, in your clothes (Philos. 10. p. 294)."

Here we recognize at a glance the hand of the reviser, the reference to ‘this book,’ the name of the second time in the name of the great and most high God, the list of witnesses in its later form. But we also note, as something altogether new, the passive use of ‘baptize’; the sinner is to ‘let himself be baptized,’ moreover ‘for the second time.’ We cannot well imagine that the latter changes in the two texts had been made in Syria in anticipation of the projected mission to the Christians of the West. For one thing, it is quite incredible that any missionary religion would from the outset entertain the thought of finding its converts in a class of persons that could only cover it with odium. For another, it is certain that the text used by Epiphanius either did not contain these particular directions for the sin cancelling ablation at all, or, at least, did not contain them in the form which Hippolytus found in the copy of Alcicides—the form, that is to say, proving expressive for sinners usually regarded as of the grossest type, and containing the summons to the second baptism. Neither of these features had been as yet assimilated by Epiphanius, nor would he have failed to demand them. In point of fact, the two passages—or, so far as regards the first, its extant version—must have been composed by Alcicides himself, after he had made approaches to the doctrine of the heathen Callistus. He addresses the Christians in exactly the same manner as their own teachers, viz. as children (a form which, it is true, had been used also by Elkesai, seeking thus to coax them to his side, and keep them there; for he had but one end in view—the formation among them of a community that should hold the Book of Elkesai in reverence. The idea of the second baptism must have struck him as full of promise for his purposes; and so, with a view to its adoption, he composed the two verses quoted above, containing respectively the ritual for gross sinners and the solicitation or summonses to the second baptism. For the former he found a pattern in Elkesai's prescription for the bite of a mad dog, and the style of the original is cleverly imitated in the successive 'or . . . or . . . .' of the interpolation.

But it was all a beating of the air: these accommodations to Roman Christianity were of no avail. Under Bishop Callistus, sinners were sure of leniency and remission without exorbitant penances, and this, moreover, within the pale of their ancestral Church; what further end could be served by their becoming Elkesaites?

The sole remaining expedition of the Syrian missionaries worthy of mention was the attempt of Elkesai, which, 30 years of fact, they themselves no longer fully understood. It is possible that some inexperienced or uneducated or unintelligent Christians were drawn to them by a liking for the novelty of the new religion which had formed a little Elkesaites group. But any such community must have been short-lived, for there was no practical interest to bind the members together. In short, it result of the Elkesaites propaganda in Catholic Christianity was such that Eusebius could speak of the movement as having arisen, and then presently came away.

(4) Later Fortunes of the Sect in the East.—In the meantime, as Catholic Christianity supplanted Jewish Christianity Elkesai, all the Jewish Christians were united in sympathy and interest. They, the Jews, who believed in every page of the New Testament, were the ideal of the Elkesaites. It was the ideal of the Elkesaites, and was the practice of the Elkesaites. They held that life arose from water. They were Elkesai as their teachers, and in their midst lived two women, sisters, who were descended from them. The members were accustomed to bend the knee to these women, and even to follow them for the purpose of securing their spittle and the dust from their feet, preserving these in capsules, which they carried as amulets. In most matters of creed and ritual they were at one with Judaism; nevertheless they were not Jews. Their distinguishing peculiarity was their reverence for the Book of Elkesai, and they did not own the authority of either the Old or New Testament. Incorporated with them were the Ebionites, the Nasaraeans, the Nazaramas, and the Osseans.

With reference to this point, Epiphanius states that the last-named sect, i.e. the Essenes, had ‘now’ renounced Judaism, and no longer lived in the manner of the Jews.

The only conclusion we can draw from these data is that the Elkesaites had given up that particular feature of Judaism to which the Essenes was attached—union and a principle of isolation for the Jewish people, i.e. their observance of legal purity in food and drink, and their consequent refusal to eat with the heathen. This defect of this sect the occurrence of a new name as a distinctly heathen cast forms a sufficient ground for thinking
it probable that a group of Syrians of non-Jewish race affiliated with the Elkesiates, and accepted their sacred book, but did not observe the Jewish regulations about food. The name 'Sampseans,' if we may trust the accuracy of its traditional form, means 'the same men,' or 'the sun-like,' not 'sun-worshippers' or the like. It prompts the conjecture that the 'Sampseans' were really a family, and indeed one of high standing. They would seem likewise to have been well-to-do, perhaps also of a semi-sacerdotal order, with the civil authorities, and on these grounds to have rapidly risen to great influence in the Elkesiates fellowship. The two great-granddaughters of the prophet willingly accepted their obeisance, while the Elkesiates by birth did not refrain from sitting with their new associates at meals; and it was for the sake of the latter that the former discarded the Jewish laws regarding food, and thus broke away from the community to which they— as a somewhat unacceptable party, it is true—had hitherto belonged. Socially, therefore, the older group may be said to have united with the newer, rather than with the newer with the older, and this circumstance took effect also upon the nomenclature. The Sampseans of Elkesaism did not surrender their high-sounding name. They were the most eminent section of the order; they became its leading group, and, when outsiders concerned with the community as the 'sun-like ones,' the older Elkesiates actually felt flattered, and, indeed, soon began to apply the new name to themselves.

The Elkesiates may have maintained for centuries their tranquil existence in the little-visited district watered by the Eastern tributaries of the Jordan, but the voice of tradition is henceforth silent with regard to them.

(6) The Mughtasila.-These same of Elkesai—but only the name—crops out once more in an etimographic note in the Kitāb al-Fikrist by Ibn Abī Ja'āfīr al-Nadim (ed. Flügel, Leipzig, 1871-72, p. 340). The note refers to a religious community whose adherents inhabited the wide-spreading swampy region traversed by the Euphrates in its lower course, and were locally known to the Arabs as al-Mughtasila, i.e. 'those who wash themselves.' We are informed that these people are numerous in the marsh-lands, and they are, in fact, the Sabians of the marshes.' They must accordingly be regarded as identical with the Sabians (also meaning 'bathers') mentioned in three passages of the Qurān (i. 59, v. 73, x. 76) and, as a people, to have lived together with Jews and Christians, to have had liberty in the exercise of their religion. This privilege was accorded to them in virtue of their monasticism and their possession of sacred writings.

The note continues: 'They maintain that people should wash (often), and they also wash all they eat.

Their leader is called رکابیل; he is the person who founded their faith.' Chwolson reads the name as al-Isaiyā, Flügel as al-Iṣāsi; but, as we have already seen, this transcation can rest upon conjecture only. The note also describes a dualistic cosmology to the sect, stating that they believed in a male and a female order of beings, and asserts that at an earlier time, as regards the two original principles of matter, the sun and the moon, the Mughtasiles attached to this opinion. On this point al-Nadim makes another interesting statement (Chwolson, i. 125 f.), viz. that the father of Mani (who founded Manicheism in the 3rd century) joined the Mughtasila, and educated his son in their faith, and that later, his son, and then the sect, began to proclaim his own doctrine at the age of twenty-four. The baptists of the Elkesiates thus trace back to the end of the 2nd century. They were known to Muhammad as monothists and possessors of sacred writings; and some time afterwards an inquirer learned from them that their founder and lord was called Elkesai—or some such name. Now, not every religion has a lord and founder. Islam, however, tolerated only such forms of religious belief as were like itself in this respect. Thus the Mughtasiles, in making some claim to being from their origin, had the most cogent of reasons for putting forward some name that might stand as co-ordinate with names like Moses, Jesus, and Muhammad in a meeting between sects; and the Kitāb al-Fikrist cannot rank as historical evidence. All that the note proves is that the priestly or learned class among the Mughtasiles had heard of the name of Elkesai as that of a religious leader, or teacher, while this again may signify nothing more than that a copy of the Book of Elkesai, inscribed with his name, had fallen into their hands. If, moreover, the volume was for a considerable period their sole possession of the kind, they would come to honour it as their oldest document; and in this way might arise the tradition that the book contained doctrines which its author had delivered to their ancestors at the birth of their religion. A religious document, however, when its possessors do not follow it in practice—and almost, indeed, in proportion to their inability to understand it—tends to become a holy thing; whose very name is an additional reason why the Mughtasiles ever really lived as Jews, observing circumcision, the Sabbath, or the gība towards Jerusalem.

The monothism of the Mughtasiles was, with some of them, only a pretext; 'to this day,' says the Arabic writer, 'they have among them some who worship the stars'; besides, it was combined with dualistic tenets, and accordingly, like that of Mani, must have been derived, not from Judaism, but—either by means of actual contact, or through the studies of the priests—from Parseism. That the Mughtasiles performed their ablutions by bathing may be presumed from the fact that they lived in a marshy district; but on the same grounds it seems unlikely that they disliked essential to use river or spring water. We cannot say whether or not they practised immersion. That Elkesai himself had proclaimed his doctrine among them is a priori improbable, even if it should be thought possible that in his day they were Jews, or had provisionally become Jews. Success among them would have induced him to remain in their midst, just as his success among a people whom the Jordan kept him there; and, moreover, it was in the latter locality that his descendants lived.

4. Origin of Elkesiasm and its place in the history of religion.—With reference to the historical connexion of Elkesiasm with other religions of similar character, the main question turns upon its practice of baptism. Let us state at once that what we have to deal with is not the mere fact of religious washing or bathing, but the requirement of total immersion in a river or spring, with the garments on, as a necessary condition of remission of sins or bodily healing.

Judaisms never at one time made such a demand, although the Essenes, it is true, bathed in loin-sheets, and must in cis-Jordanic Palestine have had themselves immersed in the water of their river. We meet with such practice in none of the Mandaean among the Mandaeans, and also in the far East, among the Hindus. As regards the latter, we find Manu enjoining that those guilty of certain sexual sins must expiate them by bathing in their clothes (Laug. i. 17) and certain Hindus from similar motives, practise immersion in rivers. The Mandaeans likewise bathe in the river Euphrates for remission of sins, being clothed in white for the occasion, just as they
formerly wore white garments in their daily life (see W. Brandt, Mandschüische Religion, Leipzig, 1889, pp. 91, 92, 224).

That the religious rites were brought to Palestine by way of the Euphrates from India we cannot believe, if for no other reason than that it is not again alluded to in the code of Manu, which probably attained its present form c. A.D. 1000, so that the practitioners have been living there since that date in a long-established or popular one in India. The probability is rather, indeed, that it migrated from the Euphrates towards the East, just as the Mandaeans themselves spread eastwards from that river into the interior of Persia.

The resemblance between the practice of the Mandaeans and that of Elkeesi is striking. But in the former we do not find anything to correspond with the vow which Elkeesi demanded from his adherents at their immersion, or with the invocation of the seven witnesses. Nor did the sacramental elements of the Mandaeans consist of bread and salt. Their oldest sacred writings were composed in the period of the Sassanians, or even earlier, but they contain no mention of Elkeesi. The Mandaeans believed that their deity dwelt in the North, beyond the mountains whence the great rivers come, and it was towards that point that they turned in prayer. These facts forbid the assumption that they owed their religious ritual to Elkeesi.

Nor are we able to affirm that, contrariwise, the Elkesiite ritual was derived from Babylonia. We may, indeed, regard it as possible, and even probable, that the Mandean cult was the older, but this does not admit of proof. For his doctrines Elkeesi did not need to go so far. Babylonia was the cradle of astrology, but this 'science' had already spread over a great part of the world. In conformity with the belief that water is the source of life and health, the Persian theologians fancied that the two trees 'All-seed' and 'Ail-heal' germinated from the sea, or from the waters of a wholesome spring. A similar idea, however, had long found a footing on Jewish soil, where it can be traced back to the passage in Ezk 47 describing the future glory of the land.

Do we find any light from Bab. antiquity upon the Elkesiite immersion? In the ancient Babylonian texts hitherto published, though we there find mention—in allegorical connection—of such acts as drinking clear water, suffuring, laving, washing, cleansing, and sprinkling with the waters of wells or springs on the Eve of the Passover, or at the sea, we have as yet discovered no definitely attested instance of immersion. The earliest known reference to the practice in the Semitic world is still the case of Naaman the Syrian, who dipped himself seven times in the Jordan in order to be healed of his leprosy (2 K 5:4).

In the civilized belt of country around the Mediterranean Sea, which extended on the East beyond the Jordan, we find the religious rite of immersion associated with that conception of the new birth which enters largely into the mysteries. With that idea, therefore, it is no doubt genetically connected, and like the mysteries generally, is to be traced to the esoteric doctrines of priests. The association of immersion with the vow and the seven witnesses, as found among the Elkeesiites, seems to imply that their founder had become acquainted with the ceremonial of one or other of the mystery-cults practised by a priesthood or a religious association. His own ritual is modelled after some popular ceremony, and he may well have taken the practice of immersion from it, as a central feature of the ceremony—from the same source. So far as we can judge, it did not fail to the lot of the Elkeesiites to have an active share in the rise or development of any religion that survived their own. It has been asserted that their doctrines had an influence upon the system of ideas embodied in the religion of the Mandaeans, but this has not been proved.

Erbauer.—D. Chwolson, Die Statiker u. der Samenitraus, St. Petersburg, 1856, I, 100-138; H. Hilgenfeld, Neue Text. Extra numismatis orientalis, fasc. III (C Heroic s, 1857, pp. 257-58); ID. Rennan, Histoire des origines du christianisme, v. IV (Paris, 1877, pp. 370, 371), also Révue des haupptgalerien der Geschicht, 1907, passim; W. Brandt, 'Die jüdische Baptismus' (Revue de la ZAW, xxvii. [1900] p. 104). Elkeesi was a Priest or Religionist (see BG I. pt. ii. 391). Fleet writes the name Ellorā. The place is still considered sacred, and is the site of a shrine of Gṛṇḍesvēra, one of the twelve saktas of Śiva, who was probably connected originally with the caves, but, when these were desecrated by Aurangzib (q.v.), it was transferred to the neighbouring village. The caves, according to Burgess (p. 4), are about half a mile E. of the village, and lie nearly N. and S. along the W. face of the hill, on the summit of which the modern village of Rozah stands. They extend a little over a mile in a straight line. The caves at the S. end are Buddhist; those at the N. end Jain; while those between these groups are Brāhmānicos.

1. The Buddhist caves.—The Buddhist group at the S. end consists of twelve excavations, which were constructed in the period between A.D. 460 and 650 or 700. Of this group three caves are especially important. That numbered X in the list of Burgess is the great chaitya, or rock-temple, the only one of the kind at Ellorā, and locally attributed to Visvakarma, the architect of the gods.

It is a splendid temple, with a fine facade and large open court in front, enclosed by a corridor, and conclusively proves that those Erkonic caves were originally designed to be filled with a temple, and are thus to be regarded as typical of a whole class, or at least of a type, of similar rock-temples and chapels, the earliest of which are probably to be found at the site, or at least within the territory, of the ancient Elkesaite kingdom. The small temple of the 5th century (q.v.) at the entrance of the Elkeesi temple is probably of the same character. The outer facade of the temple of the 5th century was entirely made of lime, as also was the inner facade of the temple of the 6th century, while the inner facade of the temple of the 5th century was entirely made of sandstone. The temple of the 5th century was entirely made of lime, as also was the inner facade of the temple of the 5th century, while the inner facade of the temple of the 5th century was entirely made of sandstone. The temple of the 5th century was entirely made of lime, as also was the inner facade of the temple of the 5th century, while the inner facade of the temple of the 5th century was entirely made of sandstone. The temple of the 5th century was entirely made of lime, as also was the inner facade of the temple of the 5th century, while the inner facade of the temple of the 5th century was entirely made of sandstone.

The second is the Dhō Thēl cave, so called because it was long supposed to consist of only two storries. In 1876, however, the lower storrey was cleared of the earth which had completely buried it. This cave seems to have been left partially incomplete, and was intended to serve both as a temple and as a monastery.

The third great Buddhist cave, known as the Thī Thēl, or three-storreyed cave-tample, was intended rather for worship than for use as a monastery.

'This is its class,' writes Burgess (p. 10), 'one of the most important and interesting caves at Ellorā. When we do find a three-storreyed Vihāra carried out with the same consistency of design and the like magnificence as in this example, and from these circumstances there is a great probability in its appearance that it would be difficult to surpass in cave architecture. The greatest interest, however, consists in its being a transitional example between the styles of the two great religious which divide between them the architectural magnificence of the present day. There are few examples of similar character with the Dhō Thēl cave, that all that immediately succeeds, it seems almost as if the builders of this temple had been persuaded to abandon the Buddhist sect, and by gentle means to adopt the new religion, and not that they had been converted by persecution, as has been very
EMANCIPATION.

2. The Brahmánical caves. The Daśa Avatāra cave, as its name, 'the Ten Incarnations,' implies, is purely Brahmánical. It contains sculptured images of all the greater gods. An inscription indicates that it was finished, or was at least in an advanced condition, in the middle of the 8th cent. A.D. The other chief Brahmánical caves are the Rāmāvarta and the Dumar Lēnā, the latter one of the finest of its kind, and interesting as being almost a duplicate of that of Elephants (q.v.).

But of all the Brahmánical monuments none is more remarkable than the Kailāsa, named after the paradise of Śiva, also known as Bāng Mahāl, 'painted hall,' which was constructed in the reign of King Rūpā, or Rūpā-śrī, the 11th king of Mālikēd (c. A.D. 769-783; see Architecture, Hind.; Lia descritive, Arch. and Asia, vol. i. p. 742). The Kailāsa is an undoubted copy of the old structural temple of Vijālakāsi, in the Madhavā District, and this again, a temple in the Dravidian style of S. India, is strikingly like the old temple of Kyālaśānta at Coonjeveram (J. H. Marshall, Arch. and Asia, 19th ed., 1895-6, p. 419; Smith, Early Hist. p. 386 f). 'It is,' says Burgess (op. cit. p. 26), 'by far the most elaborate and elaborately rock-cut temple in India, and the most interesting as well as most magnificent of all the architectural objects in the country possessed by the British Raj.'

Burgess (Indian and Eastern Arch. [1899], p. 334, ed. 1910, i. 342 f) says:

In it, 'we have a perfect Dravidian temple, as complete in all its parts as at any future period, and so advanced that we might have some difficulty in tracing the parts back to their originals without the fortunate possession of the examples on the Madras shore. Independently, however, of its historical or ethnographical value, the Kailāsa is in itself one of the most singular and interesting monuments of architectural art in India. Its beauty and singularity always excited the astonishment of travellers, and in consequence it is better known than almost any other structure in that country, from the numerous views and sketches of it that have been published.'

And pupils and admirers of architecture are prepared to show that it reveres the methods of the Buddhist caves which adjoin it, being not a mere chamber cut in the rock, but a model of a complete temple, such as might have been erected on the plain. In other words, the rock has been dressed, not externally and incipiently, on the surface of the cliff, which it once formed a part. The disadvantage of this mode of construction naturally is that the building stands in a pit. But it remains an example, probably unique, of unsparking labour devoted to the construction of a religious edifice. Among the important groups of sculpture which it contains is that of the destruction of Mahāisasura, or the buffalo-headed demon (which gives its name to its shrine), slain by Chandi or Durga; those of Śiva in his various manifestations; and the shrine of the river-goddess—Gaṅga, Śatāvatī, and Yami or Yamuna. The caves are very extensive works, superior both in extent and elaboration to any of the Buddhist or other religious caves, the Kailāsa, the Veḷivakāmara among the Buddhist ones, and the Veḷivakāmara among the Buddhist ones. Through two stories in height and in width, and in a great measure in depth, the Indra and Jagnathā Śivas are entirely dedicated in that purpose-like architectural expression which characterized the works of all the Buddhists and Hindus. They have in their cells, like the Veḷivakās, and are nothing like the Chaliya halls of the Buddhist one, the Cakkutās of the Mayūra, or the Chaliya, the famous temple of Lēnu of the Hindus. Rich and elaborate though they certainly are, the plan is compressed, and all their arrangements seem to result from necessarily cramped space; there is no possibility of any conjectured design so that they lose half the effect that might have been produced with a little more freedom (Burgess, p. 4).

They are much later in date than either the Buddhist or the Brahmánical caves. It seems that the Jaina occupied the place after the decedence of the Itihās dynasty in the 9th or 10th cent. A.D., and their only desire was to mark the superiority of their religion, then becoming important, by rivaling the works of their predecessors.

LITERATURE.—This article is based on the excellent monograph, 'Report on the Ellora Cave Temples and the Brahmánical and Jainas Caves in Western India,' by J. Burgess, forming vol. v. of the vihāra on the Ajanta, which includes a series of photographs, drawings, and plans. This is in continuation of some papers by Burgess—Bengal Archaeol. Soc., 1885, has been superseded by Burgess—Bengal Archaeol. Soc., 1885; see pp. 367-354 for the Buddhist caves; 431-463 for the Brahmánical; 496-502 for the Jaina. Also see J. Ferguson, Hist. Encyc. of Indian and Eastern Architecture (1830), Ch. 27, 334-338; J. Ferguson, Arch. of Hind., vol. i. 1910, i. 139 f, 127 f, 150, 201, 347 f, II. 191; V. A. Smith, 'The Temple Architecture of India,' vol. i. 1913, 347-384; the place is fully described by Syed Hossain Bihagri and C. Willmott, Historical and Descriptive Sketch of H. I. the Women's Monasteries (1883), II. 440 f. For illustrations also see W. H. Workman, Through Town and Jungle (1904), p. 158 f. The earlier account by J. H. Seely, The Wonders of Ellora (1st ed. 1824), has been superseded by later investigation.

ELYSIUM. — See BLUST (ABODE OF THE), STATE OF THE DEAD.

EMANCIPATION. — Definition. — Emancipation in its more general sense signifies the liberation of the individual from the yoke of the community and its institutions; or, from that which is custom; or, again, the liberation of a smaller and weaker community from the coercion of a larger and more powerful. As the restrictions in question may vary greatly in kind, and may relate to various aspects of life, emancipation may take different forms. Before we discuss the moral character of the movement towards freedom, we shall make a general survey of the whole field. We may distinguish between intellectual and philosophical emancipation, and state the difference. We shall then consider the power of the idea of liberty and emancipation in the sphere of action, though for the most part the two have proceeded hand in hand.

1. Emancipation of thought. — Thought becomes emancipated when it casts aside the traditional views and prejudices which have impeded its free movement in the past. We do not, of course, apply the term 'emancipation' to every case where confused or unformed traditions are abandoned, but only to cases where the general consciousness of a community is concerned, and where the restrictions upon thought had the sanction of some coercive authority. Thus, in particular, the moral consciousness may pass over from the abstract conceptions hitherto hallowed by tradition and established by public opinion; religious thought may similarly pass from under the bondage of sacred traditions and ecclesiastical authority; and there may also be an emancipation of science, as when it frees itself from the fossilized prejudices that have hitherto hampered its progress; or of art, as when it is delivered from some hoary religious tradition, or from the incubus of an antiquated school or style. Emancipation of this kind is always allied with the spirit of criticism, as in Greece, for instance, where the Sophists impugned the morality of tradition and of popular religion, and the philosophers sought to undermine current beliefs regarding the gods, and where histrionic art was at length overthrown by the great artists. Similarly in India, of course, the ascending movement from the ascendency and authority of the Brāhmans by proclaiming a universal redemption from suffering; while Christianity broke the yoke of the OT legalism by imbuing the mind with the life-giving spirit, in place of the dead letter. Thus, too, the sciences freed themselves from the despotism of medieval theology—by the device, first of all, of a twofold truth, and then by the growing conviction that they must pursue their way by their own hands, and must treat us as an.

W. CROSE.
end in itself. Finally, the human mind attained to the conception of complete liberty of thought in all its phases, and in course of time this was claimed as a right. The prerogative of freedom in religious matters, in scientific inquiry, in the utterance of one's convictions, came to be regarded as inalienable, and the State was called upon to preserve it inviolate. True, a certain liberty of thought continued in the Greek world; nevertheless, charges of impiety (διηθεσα) were not unknown, as in the case of Protagoras, Diagoras, Anaxagoras, Stilpo—to say nothing of Socrates; and at length the Athenian schools were closed by Justinian. Complete emancipation of thought was first claimed as a legal right by the modern champions of Natural Law, and has been won only after the severest conflicts. Only in modern times, too, has aesthetic thought sought to deliver itself from ecclesiastical and national influences, by insisting upon a free secular art.

2. Emancipation in practical life. — The process of emancipation, however, bears not only upon thought but upon practical life, and its progress in this sphere seems to accelerate as we approach the present day. To begin with, the individual has become more and more independent.

(1) The emancipation of women. The emancipation of women was defended even by Aristotle; it was viewed with disfavour by the Stoics, while in the Roman Empire it was greatly mitigated by law; it was still recognized, as, e.g., by Aquinas, in the Middle Ages, and was maintained even in the 19th cent. by the Southern States of N. America; now, however, it is entirely abolished in Christian lands, and, outside Christendom, prevails only amongst the Mahommedans. But the emancipation of women in the lower classes almost worse than slavery, and in the United States, where slavery no longer exists, there still remains the negro question, as also the problem of conferring civil rights upon the liberated race under conditions which will ensure a proper exercise of the privilege. In fact, the general policy of the higher races in regard to the lower is one of the most formidable questions of the day, as it can hardly be denied that the developed civilization of the former, allied as it is with superior physical resources, has often been employed in oppressing the latter. In these respects the emancipation still lags far behind.

(6) The emancipation movement embraces also the question of women's rights. Among ancient peoples the position of woman was very limited. In modern times we find the woman in line with the principles underlying the entire social order. Women, according to Confucius, are not easily dealt with.

1 'If you are intimate with them, they will not obey; if you keep at too great a distance, they are angry with you. Woman is always dependent— as a daughter, upon her father or elder brother; as a widow, upon her son. She is under tuition and discipline to her husband.' She ought to keep within the house; her duty lies there. 'On the higher side, she must give due homage to her father-in-law; on the lower, she must serve her husband and husband's father.'

Nevertheless, Confucius holds that marriage is the be-all and the end-all of mankind; that woman is the paramount person in the sphere of love, and that reverence is her due. Certainly divorce is easier than remarriage; the dread disease, apathy, excessive loquacity, form sufficient grounds. But the man may not disown his wife if her parents be dead, or if, though now rich, she was originally poor and of mean extraction. Concerning domestic duties,

Nor did Buddhaism, in spite of its universalism, place women on a level with men; its highest morality demands entire obedience from sexual inferiors. As the rule, by the rulers, confine to their own apartments, and they did not share in the education given to men; only one exception is found in the hetervra of a later time. Yet Greek women, not without cultured women, such as Sappho, while Penelope's constancy and Antigone's sisterly affection were proverbial. The Ecclesiastes of theodoteus depicts women as so rank lower than monks. 'Inerucible as the way of a fish in water is the nature of woman, those chives of many devices, with whom truth is hard to find' (Chorreilopps; cf. Oldenberg, Budhaha', 1906, pp. 169 f., 385 f.).

In Brahmanism, again, marriage is made much more of: every one ought to marry. Still, according to the Laws of Manu, the husband is the head of the wife; she must do nothing to displease him, even if he give himself to other lovers; and, should he die, she must never utter the name of another man. If she marry again, she is excluded from the heaven where her first husband dwells. Unfaithfulness on the wife's part is punished with the utmost rigour. 'A woman is never independent.' She cannot inherit, and after her husband's death she is subject to their eldest son. The husband may even chastise her with the bamboo-rod. It is Brahmanism, nevertheless, which gives us the saying: 'If the wife be made unhappy, the sacred fire soon dies out; if she executes her home, its end is at hand.'

Among the Persians the recognized necessity of preserving the germ of life is in full harmony with their views of life in general. Marriage is, therefore, reckoned a duty; and every marriageable young woman must ask her parents to find a husband. Chastity is well guarded, but, as in the Laws of Manu, the woman is subject to the man. Every morning the wife must nine times ask her husband what he wishes her to do; she must honour him as the pure honours the pure. In the later Gatha period, however, women are more on an equality with men; they are not to be excluded from communion with Ahura Mazda, but are to rank along with men in every respect.

In Muhammadanism, women are secluded in the harem. They are denied all freedom of action, and all participation in matters intellectual. Certainly the Prophet raised the status of women above that assigned to them in ancient Arabia; in particular, the woman was no longer a mere heritable chattel of her deceased husband's estate, but was herself capable of inheriting; while, again, a free woman could not now be forced into marriage, and, in cases of divorce, the husband was required to let the wife retain what he gave her at marriage. Moreover, women of the upper classes might occupy themselves with poetry and science, and even act as teachers, while those of lower rank not seldom shared the joys and sorrows of their husbands, as mistresses of their households. The mother likewise must be treated with respect. Furthermore, the seclusion of the harem tends to keep women in a subordinate position; their intercourse with one another is limited, and their education is neglected, though in the higher orders of society their existence is not devoid of comfort. The compulsory practice of veiling shows how little they are trusted.

Among the ancient Jews polygamy still persisted, and divorce, more especially in the later period, was easily procured. The wife was placed in subjection to her husband; still, marriage was reckoned honourable, and a virtuous wife was deemed of more value than rubies (Prov. 31:10). The mother was highly esteemed, and this name was regarded as a worthy object of benevolence. While polygamy was the rule among Oriental peoples, the case was otherwise in Greece and Rome. Among the Greeks women were confined to their own apartments, and they did not share in the education given to men; the only exception to this is found in the hetervra of a later time. Yet Greek women, not without cultured women, such as Sappho, while Penelope's constancy and Antigone's sisterly affection were proverbial. The Ecclesiastes of theodoteus depicts women as so
far emancipated that they became a ruling power in the State. In the *Emancipation* Widows fact. Justinian also brought his physical intercourse was sought not in married life, but in friendship amongst men. In *Marriage* to *Wives* we find: the wife was under the absolute control of the husband—like a daughter, in fact. At a subsequent period, however, the matron was accorded a higher honour; witness, *e.g.*, the definition of marriage: *Matrimonium est noster et feminas coniunctio, omnis vitae consortium, iuris humani et divini communicatio* ("Marriage is the union of man and woman, complete community of life, joint-participation in Divine and human law").

The growing independence of women is also indicated in the laws regarding inheritance. According to the XII Tables, women could not inherit at all; by the Prasorian law they inherited in the third degree. When, further, the law onnicetry came footing with men in cases of intestacy. Further, the right to dispose of property by will, at first denied to women, was at length granted, in the event of their remaining single or having no children of their own family in due legal form. But the institution of marriage was much impaired by the egoistic tendencies of Roman law. Celibacy became common. Women were allowed no choice in the matter of marriage, and they had no effective safeguards against being repudiated. Even Cicero put away his first wife, in order to pay his debts with the inherited property of a second. But it was always looked to the legal disabilities by underhand means, and even to intervene with political affairs—a state of things attended with the direst moral results.

Christianity, emphasizing from the outset the value of personality in the sight of God, proclaimed the equality of the sexes. This is shown by the injunction regarding divorce, which, recognizing no justification for that proceeding save *porneia* (Mt 5*7* 19), left nothing to the man's caprice.

The fact that the principle of equality was not pushed forthwith to its full consequences is due to the ascetic temper of the Early Church. While marriage was regarded as a symbol of the relation between God and his Church (cf. Eph 5*2*), St. Paul also views it as a safeguard against immorality (1 Co 7*2*). Widows took a prominent part in the life of the Early Church, and an order of deaconesses was instituted, but the idea of man and woman as complementary to each other was not urged so strongly as their equality. It was but natural, therefore, when the moral factor was at length overridden by that of religion in the narrower sense, that monks and nuns should be placed on a level, and that, in particular, as marriage was counted inferior to the celibacy of the religious, the distinctive character of women should be lost. In the less estimable state, estate of marriage was made a sacrament, and declared to be indissoluble, the effect was, on the one hand, to subordinate the individual to the institution; on the other, to extrude the ethical element altogether. As it was the special prerogative of the medieval monks to make methodical pronouncements upon moral questions, this theory of marriage continued to hold its own; though still based upon the element of friendship between man and wife, and upon the woman's freedom to marry or to remain single, even against the will of her parents; and though Duns Scotus declared that monogamy was a more exacting state than monachism. While woman's place in the marriage relation was thus one which ill suited with her distinctive nature, a kind of counterpoise was provided by the romantic and enthusiasm of the Middle Ages, though its object was not the wedded wife. Chivalry. Notwithstanding all this, however, it remains true that in Greece genuine intellectual intercourse was sought not in married life, but in friendship amongst men. In *Marriage* to *Wives* we find: the wife was under the absolute control of the husband—like a daughter, in fact. At a subsequent period, however, the matron was accorded a higher honour; witness, *e.g.*, the definition of marriage: *Matrimonium est noster et feminas coniunctio, omnis vitae consortium, iuris humani et divini communicatio* ("Marriage is the union of man and woman, complete community of life, joint-participation in Divine and human law").
EMANCIPATION

273

this question has been taken in hand by women themselves. In Germany married life was until lately regarded as the normal vocation of women, but this view was obviously irrelevant in regard to those who remained single, and they have more women than men. In England the modern movement began with Mary Wollstonecraft's *Vindication of the Rights of Woman* (1792)—a work which drew its inspiration largely from France; but it is rather the whole-hearted ad-

vocacy of J. S. Mill, half a century later, that we must trace recent advances in the cause of female emancipation, as also perhaps the present agitation for full political rights. More particularly in the United States the stage has been reached where women no longer look upon marriage as their specific calling, but seek complete equality with men as a matter of principle. Endeavours are accordingly being made to give them access to all the various professions, in order that they may gain an independent footing in society, and even to grant them the franchise, as a step to public life in State and Church—in a word, to remove every disability of sex. When this state of things is appealed against by pointing to the physical difference between the sexes—a difference which remains—feminist writers (such as Mrs. Rapin's theory of evolution is brought into court for the purpose of showing that by habit, heredity, etc., women may in time develop those particular qualities of which their circumscribed position has till now impaired the cultivation. But in truth the differ-

entiating tendencies of Nature herself may well be regarded as depreciating such factitious development. We dare not disregard the inherent heterogeneity of the sex. After all, marriage is grounded in the natural order, and any other career for women is but an expedient which, as adapted to her individual capacity, will, in default of marriage, secure for her a position of economic and moral independence such as a moral personal-

ity requires. The 'free love' which some propose to substitute for marriage would differ from prostitution only in degree. Marriage reform still lacks clear definition. The true method of emancipation is that which assigns to each sex the task adapted to its peculiar character and gifts, there-

by investing it with its own moral dignity and honor; and, in this way, ensuring women in a position to understand the distinctive life of men, and to share their interests, while men on their part undergo the correlative discipline. Mar-

riage must continue to rest upon the intimate friendship which is the basis of fulfilling the common task of maintaining the home and rearing children.

We learn from the above outline that there has been a gradual advance in the emancipation of women, an advance which is based upon a proper measure of their personality, but which also tends to assume debased and unnatural forms when the distinctive qualities of the sex are ignored. The probable result of disregarding these qualities would be a recurrence of the ancient view of women, viz. that they are essentially equal to men, though of weaker mould and, accordingly, of lower station in view which was sanctioned only by allowing for the specific characteristics of womanhood, and by conceding to women a position of equality in keeping with their special gifts.

(c) We see a corresponding development of freedom in the relation of the individual to the family. In Rome, the law of the XII Tables invested the father with, what has been called, &quot;infinite worth&quot;, and even with the power of life and death; and in the era of the Republic a son of full age was still under paternal jurisdiction in domestic matters, though otherwise a free citizen. So strongly was the unity of the family insist upon, that a son could neither possess nor acquire independent property during his father's lifetime. The procedure in connexion with a son's emancipation (in which we have the original usage of the word) was, according to the XII Tables, that the father sold his son three times to the so-called *pater filiarius*, who had promised not to take the contract in earnest. But the power of the *pater familias* was circumscribed by use and wont. In the event of a capital sentence, the father invoked a family assize; and eventually, in the Imperial period, even this right was annulled, and the father was compelled to carry the case to the authorities. The legal authority of the father over his descendand, and the amenability of the individual to family juris-

diction were still further modified by Christiani-

ties, which paid higher regard to the individual, making him more and more independent of the family; while it based the family on a moral and emotional, rather than on a purely legal, founda-

tion, the legal aspect being now attended to for the benefit of the State. The Christian principle that spiritual qualities are of more value than corporeal, and that even children, as souls in the making, are of infinite worth, justified its refusal of the *pater familias* to accept the custom of exposing weak infants—a practice defended even by the most enlightened Greek philo-

sophers. The Christian view necessarily led to a restriction of the right to punish children, and to the civil protection of their life and health, even against their parents. With this we may compare the modern law, which prevents careless parents from standing in the way of their children's education.

The ideal of education upheld by the great thinkers of Greece was that the family should transfer its responsibilities to the State—a position natural enough in view of the defective condition of family life in Greece. Among Christian peoples the place of the State was in a measure assumed by the Church, which took in hand the work of education—an arrangement which still to some extent prevails in Roman Catholic countries. The family thus became subordinate to the Church and the *religions*, and education was handed over to the monastery and the convent. The countries of the Reformation, which had maintained its independence in a markedly higher degree, recognized the educative value of home life, as specially adapted to train the heart and the disposition. Provision was made both for attaining knowledge and for developing talent and intelligence by the institution of public schools, the maintenance of which fell upon the State; though in England private education was still recommended by Locke. The augmented demands for intellectual culture, and for its dis-

semination (within limits) amongst the people at large—as even Luther had desiderated—practically made it incumbent upon the State to undertake the development of natural talent, and more par-

ticularly of the mental faculties. In some coun-

dries school-attendance was made compulsory, the children's right to be educated being thus enforced even against the parents, and industrial schools were provided by the State in the interests of children whose moral training was criminally neglected at home.

In all this we discern a progressive liberation of the individual from the ascendency of the family, though the latter by no means ceased to operate as a genuine educative factor. Similar progress has been made in regard to the law of education. The conviction that a man's education should be directed towards making him an independent personality has become more and more explicit.
EMANCIPATION

Recent educational science pays special attention to the transition stage between youth and full manhood, and regards it as the definitive task of education that the discipline of home and school, should be trained with a view to the attainment of his ethical majority.

In this connection Scheler's theory of the distinction between aristocratic and democratic families, pointing out that the family relationship is much more effectively maintained in the former than in the latter. He especially urges that the parental authority on its moral side should gradually pass into the hands of the older persons, and, on this respect it insists upon not merely to enable freedom of decision on the part of those who have reached maturity; the parents, in short, shall then be no more than counselors.

Thus the family, once a legal institution, has become the moral community of the home, enjoying, nevertheless, the protection of the law; the rights of the individual members, especially of those under age, are protected by the State, even against the family itself; while, in a moral and legal respect, increasing regard is paid to those who have attained maturity and independence, more particularly with a view to their becoming founders of new families.

(d) The emancipation of the individual has also a social reference. Not a few men are bound to his caste, and cannot rise above it. In China, where the system of caste does not prevail, the individual's position in the social organism is defined by religion and by a most elaborate ceremony, which tend to impede the spontaneity of social life. In regard to property, however, the conditions are more favourable, and land can be tilled or sold as the proprietor pleases. In ancient Greece social life had not as yet freed itself from national life; the individual, as Aristotle expresses it, was primarily a ἱστος πολιτικός, while the theory and practice of the State set forth in the Periclean system of Plato's Republic hardly left room for personal independence in social and economic relations. Nevertheless, in regard to social life, Greece shows a certain advance upon Brahmanic India, since it no longer made birth the criterion for participation in public life—a reform explicitly decreed in the laws of Solon, which, however, still countenanced slavery. In the period after Alexander the Great interest in the State began to wane before social life and friendship, which had been extolled by Aristotle, and especially by Epicurus, in whose opinion the State was simply a contract for the attainment of mutual security. This social fellowship, however, did not embrace family life; it was a friendship amongst men, occasionally, with hetaerae. Nevertheless, the interests of the individual came gradually to the front. In Muhammadanism the Qur'an is the great authority in matters not only of religion, but of morality, law, and social order as well. The Prophet, or his vicegerent, the Khalif, is invested with power to regulate the tenure of property; the system, more particularly as regards the land, may be called aristocratic. Social life is at a very low level, resting as it does on the separation of the sexes; and, wherever a better state of things prevails, it is not due to Islam.

The theocratic standpoint likewise dominated social life among the Jews, but, while the land was regarded as belonging to God, yet the social and religious legislation, though not always carried out in practice, served to strengthen the family on its aristocratic side, as is shown, for instance, by the regulations regarding the jubilee, the Sabbatical year, gleaning, etc., which were designed to avert utter impoverishment. With some exceptions the various crafts, such as tilling and cattle-rearing, were held by the members of the family. The consciousness of being the chosen people of God bound the Israelites more closely together, while the simultaneous festivals, the observance of the Passover, and the Sabbath, with its mandate of rest for man and beast, tended to promote the social side of family life. That there has not only grown independence of the family and its head is set forth in the Law, and it was in view of this ethical end that statutory barriers were raised against impoverishment.

In Rome, again, we see a certain progress in the realization of social independence. The long-continued conflict between plebeians and patricians, the outcome of which was to equalize the two parties, bore rather upon political than upon social life; yet it was not without significance for the latter, as it made clear that social privileges were no longer to be the appanage of birth, but the reward of meritorious public service. The later period of Roman history, however, was marked by the formation of numerous associations, which, on the whole, were an expression of the desire for freedom in social matters; in fact, Julius Caesar recognized the liberty of the smaller autonomous societies, but also the independence of municipalities. By making life secure, and by giving the potestas that to disposing of his property in his own way, it also guarded the right of association for social and religious ends. But, as those liberties were without ethical character, the relative enactments simply led to an increase of selfishness, enabling the privileged few to reduce the rest to penury.

In Christianity, which so strongly emphasized the ethical value of personality, even property was viewed in a moral light, and men became aware that they were responsible to God in the management thereof. The conception of Christian equality in social and economic relations found expression first of all in a magnificent benevolence, and the great end of riches was believed to be relief of the poor. But the idea of equality in the sight of God had also a vast influence upon the social life of Christian communities. Certainly distinctions of class were not done away with; nevertheless, all were equal in the eyes of religion—a thought which had found expression in Stoicism, though without any practical issue. Christianity also effected a deliverance in the sphere of custom, Christians either breaking away from heathen practices, or else, as was often the case, transforming them, and feeling themselves individually responsible for the reform—a line of action urged especially by Ter- tullian in the one-sided, but all the more powerful, appeals of his treatise De monasteriis, and by St. Clement of Alexandria, who, however, treated ancient usages with a more tender hand. Doubtless men were then so profoundly concerned with the world to come that they retained but little interest in earthly goods, and social life was largely confined to religious intercourse. Even in the primitive Church we find warnings against wealth and its perils, and in no long time it came to be believed that only was good to God in the management of his affairs (Ambrose), and that voluntary poverty was a mark of superior sanctity; while, similarly, those who abandoned the world and the family for the desert or the cloister were held in high repute. But, while the endeavour to escape from the world and to be inwardly free from its entanglements was itself the outgrowth of a genuine emancipative movement.

Evens in the feudal system with its class divisions, and in the system of trade guilds which prevailed in the cities, there grew up a renewed interest in social life, the general trend of which was likewise favourable to individual freedom. In the economic power and dis- abilities and his dependence upon his guild, and in spite of frequent conflicts between the various
ranks of society, his economic freedom was promoted by the expansion of agriculture, commerce, and the Industrial Arts. Thus, access to tribunals established on their behalf; and, while the guilds frequently imposed restrictions upon freedom of action, they also afforded protection.

As against the Church's authority over the individual, the Reformation asserted the 'freedom of a Christian man' as the watchword of personal liberty, thereby universalizing, on religious grounds, the advantages which, on social and political ground, the powerful had arrogated to themselves in the previous centuries. Moreover, the Reformation, affirming on principle the moral dignity of labour and of the secular calling, laid the foundation of a new organization of society, which was wrought out in subsequent centuries. Luther's contention that wages should be proportionate to work has a wonderfully modern ring. Then the Mercantile System, laying stress upon manufactures, commerce, and the use of money (in place of barter), helped to facilitate the transport of goods, the process being furthered also by the Physiocratic, while, as far as possible, removed the original assignation to agriculture, yet contended for complete freedom of trade, made war upon guilds, Government concessions, and the burdens of the peasantry, and thus laid the foundation of the subject. Finally, Adam Smith and his school, repudiating the compulsory element in the guilds, and advocating open competition, set the seal upon individual freedom, and their investigations were doubly important from the fact that, as regards both the acquisition of property and the liberty of the subject—matters in which they had the support of the philosophical Natural Law from the time of Locke—their own contributions to the philosophy of natural rights, and served to assign to the individual his rightful place in the larger system of national and international life. In the French Revolution, the principles of freedom and equality advocated by Natural Law brought about the abrogation of innumerable privileges, and the emancipation of the 'third estate.' But the weak point in the movement was the people's lack of moral preparation, and the failure to recognize natural differences among men. The general rights of man, which from the religious point of view are based upon the equality of all before God, but which were traced by Mably and D'Alembert to the sense of moral and civil law, were urged so ruthlessly, that the actual disparity of men in their moral, mental, and physical qualities was ignored.

While the principle of open competition freed the individual from the limitations of his class and his trade, yet the new system of production, with the requirement of capital, introduced fresh difficulties, the solution of which has been undertaken by Socialism. Socialism (q.e.) begins by recognizing the actual inequalities of men, tracing these not to natural gifts—this being assumed rather to be equal in all—but to disparities in the possession of productive capital. Though an open door has been set before the individual, and the obstacles to the development of his faculties cleared away; though equal political rights have been conceded to all, and the class distinctions which stood as a barrier between the subject and the subject of law, were urged so ruthlessly, that the actual disparity of men in their moral, mental, and physical qualities was ignored.

To give practical effect to the idea, it is proposed to turn the State into a great industrial company, which would guarantee to every man the due remuneration of his labour. In point of fact, however, such an emancipation of labour, resulted in the loss of personal freedom; and, as the worker would then possess no capital, but gain at most sufficient wages—in the form of work-certificate—to procure him the means of enjoyment, the system would bring the worker to the selfish desire for happiness, and check the impulse to produce, which thrives only where it is free. We must, therefore, recognize that both the policy of work-certificate, the system which emanated from England, and the Socialistic movement, which first arose in France, were prompted by the spirit of emancipation; only, these movements are concerned with the material rather than with the moral side of man's nature, and with what is common to all rather than with the peculiar qualities of the individual. A higher respect is, therefore, due to those who emphasize the ethical aspect of the social problem and the ethical significance of property, and who desiderate a true personal independence, guaranteed by such a system of ownership as would enable each to discharge his proper function in the social organism, and, so far as possible, to lead such a life as keeps him from fulfilling his vocation as a man and as an individual. A similar object is aimed at by the renascence tendency to form corporate societies standing midway between the individual and the State—societies in which a man may act as a voluntary member, and from which he derives a certain support and security. A practical attempt to deliver the working man from the power of capital is made by the Trade Unions, which secure a proper representation of his interests, and treat with capitalists and their combinations upon equal terms. Again, provision is made in Germany for old age and sickness insurance, and, while in Great Britain old age pensions are now paid by the State, and there and in America the same purpose is served in part by funds accumulated independently of the State. The emancipation of factory-workers, miners, and rural labourers is sought in ameliorative legislation.

The emancipation movement makes itself felt in the sphere of social intercourse precisely as in that of economics. Social intercourse is regulated by custom; and here also a beginning has been made with that levelling process which looks to the worth of personality as such. While formerly distinctions of rank were rigidly preserved, the sense of equality has been intensified by international intercourse, by the recognition of human rights and of the ethical value of labour in general; and this manifests itself in the respect and courtesy shown even to social inferiors. It is, of course, true that this tendency towards the democratization of society is counteracted by a tendency towards differentiation, which is constantly splitting society into new and mutually exclusive groups. But, as the various ranks are arranged no longer according to birth, but according to occupation or profession, there may grow up in the professions themselves an ethic and etiquette which do away with the distinction of birth, while, again, the equal respect paid to the several professions—the moral value set upon work in general—practically opens to every man the door of any and of the highest calling for which he is fitted. Moreover, in the ordinary business and social intercourse, the qualifications of the professional caste. Both of these modifications may have an effect upon custom, and in this respect, too, modern society exhibits a movement towards the emancipation of classes from the thraldom of their position—a movement which has made most headway in the United States. Recent ethics has made it increasingly clear, however, that custom is not a thing fixed and stable, but is ever being moulded afresh.
EMANCIPATION

by the action of individuals, and that every man shares in the responsibility for its right development.

Coming now to the larger communities, the State and the Church, we find the process of emancipation at work in various forms. It may manifest itself in the liberation between the individual and either of these communities, or, again, in the relation of these communities to each other.

(c) First of all, as regards the tie between the individual and the State, there is a most distinguishing fact between countries like Judea and Persia, where there was a national religion established by law, and where every citizen was bound to conform to its authority, alike in belief and in practice, and countries like Greece and Rome, where religion was, indeed, a matter of the State, but where no pressure was put upon a man so long as he did not overtly violate the sacred institutions. In Rome, the devotees of the religiones licita were allowed absolute liberty, on condition that they observed the worship of the Emperor; while in Greece it was possible for a free philosophical religion to develop from the popular cults. Christianity was in that case a matter of belief, and the salvation of the individual really began with the Reformation, which made the personal assurance of salvation, the testimonia Spiritus Sancti internum, a matter of superhuman moment, and regarded the Church as the mediate community of believers. But the Churches of the Reformation had their own fixed Confessions and Liturgies, and presently came to take their stand upon the infallibility of Scripture. In no long time, therefore, personal liberty fell again into abeyance, and all the more completely that the task of maintaining doctrinal purity was practically handed over to the State.

At length, however, under the influence of modern philosophy, and of natural and historical science, the religious spirit wrenched itself free from ecclesiastical authority; the Church itself became the subject of critical inquiry, and the system of Churches usually called National Churches was partly superseded by the policy of public toleration or the liberty of individual conscience. It is, again, the United States which has made most progress in the latter direction, for there the individual may choose at will among the various denominations, and more as he pleases from one to another; though, on the other hand, diverse tendencies within the various communities themselves are less willingly tolerated. In Europe the system of theological licences was allowed to continue very generally—Churches which more or less strenuously maintain their traditional worship, doctrine, and usage, and hold their members in a position of dependence. Yet within these Churches we find various types of thought existing side by side, more especially in the Protestant communities of Germany and Switzerland, and in the Church of England; and religious freedom broadens out more and more, though not altogether without opposition. It is worthy of special note that the right of the individual to take part according to his abilities in reforming the Church from within is more and more generally acknowledged.

Moreover, the sphere of individual participation in the national life has been gradually enlarged. The great monarchies of the East—Babylon and Egypt—gave the mass of the people no voice in the control of public affairs. True, the Greek States and the Roman Republic obliged their citizens to take part in the government, but the enfranchised classes were small in number, and their privileges were subject to the condition that the State should superintend their moral training. As a matter of fact, it was the feudal State of the Middle Ages that began to lose this control over the enfranchisement with respect to the law, and with the people's right to vote supplies—witness the English Magna Charta of 1215; to the same period we must refer the growth of the doctrine of public authority by the growing independence of territorial and local rulers—a state of matters exemplified by the condottieri of Italy. To these signs of progress we must add the nascent theories of Natural Law, according to which the State derived its authority from the people, as was held by Oceam and others. The severance between social and national life which is gradually being effected in the modern world is an index of the increasing prestige of the individual and the class in relation to the State. Finally, comparing the views of Natural Law held by a man like Locke with ancient theories of the State, we see how great an advance has been made upon the interests; for, according to Locke, the function of the State is merely a legal one, viz. to protect the individual and the family in life and property.

Reference has been made to the fact that the State is based upon a contract of its citizens, and that, accordingly, its part is to act in their interests. The French Revolution was an attempt to carry out the principles of liberty, equality, and fraternity, and to abolish the privileges of the favoured classes; and since then most European countries have adopted constitutions which not merely compel the citizen to obey and to pay taxes, but also enable him to take a greater or smaller share in the national life by the exercise of his vote. Schleiermacher in his Politik puts the matter thus: government on the one hand and subordination on the other should be shared by all, every man being in one aspect a ruler, and in another a subject; while W. von Humboldt, in his work entitled Ueber die Grenzen der Wirksamkeit eines Staates, makes it incumbent upon the State to furnish the smallest possible guarantee of the citizen's right to free self-development. When we consider the expansion of the leading States of today, and the share in their government which is nevertheless guaranteed in varying measure to their citizens, we see that such advance has been made upon ancient conditions; for, after all, the democracies of old correspond rather with the oligarchies of modern times. Once more, it is the United States which has gone furthest in applying the principle of personal liberty, inasmuch as, on the one hand, the Government has its functions circumscribed, no longer holding the citizen in tutelage, while, on the other, every citizen is free to take a part in public life. At the same time, the experience of that country shows that civil emancipation requires a certain standard of education in the citizens, and that its least necessary complement is the existence of a large degree of social progress. In Europe, on the other hand, more especially in countries where the monarchy still bears a despotic and autocratic character, we find a growing tendency among thinkers like Tolstoi, who would abrogate all State authority in favour of the love of one's fellow-man. Certainly this is a warrant for personal participation in the government of one's country, to which at the same time obedience must be rendered, is to be found alone in the right of moral self-determination: in fact, the growth
of the sense of moral responsibility amongst the people, and of their respect for the constitution and laws of the country. It is not for the State alone, but for the citizen, to bear the burden of the civic capacity for a responsible share in the national administration. Accordingly, in reference to the French Revolution, Schiller and other German writers maintained that the revolution, which would take its destiny into its own hands must possess an unwrought moral character, lest liberty of action should degenerate into pure caprice and unreason.

Similarly, it was Kant's conviction of the ethical value of personality—the idea of national autonomy—which led him to urge that free moral action was based upon law, and that a legally constituted State was essential to the realization of moral freedom. Since in the modern State the first principle of legal administration is the equality of all before the law; since punishment has lost much of its former barbarity, and is designed mainly to preserve law and order; since the State makes it its task to protect the common rights of man, and since this protection covers not only life and property, but also liberty of conscience, of thought, of inquiry, and the freedom of the press; we may regard the modern State as the free citizen, as he may claim publicity protection for his most sacred interests, whether material or spiritual, and may look upon the law as the sponsor of his absolute right to self-government. This is the rule of the Church; for another, writer after writer took up the controversy in defence of the State's rights. Early in the 9th century, for instance, Vincent of Luxemburg in his work De Regiis, spoke of the king as the earthly counterpart of God; Henry IV. found a championship in the Italian and French schools, while Frederick II. in his Letters upheld the national prerogatives, and had the support of Peter of Vieu and Thaddaus of Benezee. Dante's De Monarchia had a similar view. In the time of Louis of Bavaria the independence of the State was still more firmly based on a theory of the rights of William of Occam, by Marsilius of Padua in his Defender Fisci, by Leopold of Habsburg in his Tractatus de Ubi Regni et Imperii, and in France, in the time of Henry IV., the State was maintained by Froissart in his Des Annuities de la France. As against the assumption of the concept of the State as the absolute independence of the State; as against the idea of the universal empire, he advocated the unity of the Italian nation, though all he claimed for the State was its supremacy in regard to its finance and its external power and prosperity.

The emancipation of the State from the Church in countries dominated by Roman Catholicism can come about only through conflict with the Church itself. Even to the present day the Roman Catholic Church claims to be absolutely supreme in all questions which relate to the spiritual interests—a contention which finds frank expression in the Syllabus of Pius IX. The result is that, whenever a Roman Catholic State unfetters itself from ecclesiastical dependence it is associated with an irreligious character: the views of Machiavelli afford a typical illustration. But, as it is impossible that a people can live permanently without religion, Roman Catholicism must be preserved by a process of evolution between the two extremes: on the one hand, an irreligious and secular standpoint, where there is no concern for anything but material prosperity, and, on the other, a position of subjection to the Church; Spain and France furnish instances (cf. CONCORDAT). The liberation of the political from the ecclesiastical interest can in fact attain a permanent footing only when the State aims at something higher than material prosperity and enjoyment, and when at the same time the Church confines itself to spiritual affairs, and is concerned solely with the fostering of the religious life. The numerous tentative and developments of this conception made in the Middle Ages, as, e.g., by Frederick I. of Hohenstaufen, Dante, William of Occam and his allies, could win no real acceptance while the Church remained unreformed, as was shown in the case of France, on which had to renounce French Gallican liberties of Louis IX. in favour of modern Ultramontanism, and is now endeavouring to free itself from the latter. Cf. art. EASINISM.

In the process of emancipation of State from Church, a crucial and epoch-making stage as
EMANCIPATION

reached at the Reformation. The Church's function was now in principle limited to the religious nurture of the soul; the Church itself was viewed as the community of faith. It was, therefore, impossible for the Church to assert the State, as the latter too had a Divine commission—to foster justice, to maintain order, to ensure liberty of moral action on the basis of law. In point of fact, as a principle of national development no Church's mediation, but could win the assurance of salvation for himself, and as he recognized that he had been elected to realize himself as a free moral agent, and thus to become something more than a passive unit in the national life, his new-born conviction was really an anger not only of his own personal liberty as a citizen, but also of the emancipation of the State itself. Calvinism, which interpreted the consciousness of election to life as an incitement to moral practice, was marvellously adapted to endow the nations with a freedom based upon personal responsibility, and thereby to procure the liberation of the State from the Church, as is well, the civil power would be called making the Church's function a kind of the Eastern Church was subject to the State; doctrine was a State concern, and was frequently enforced by Government authority. The Donatist controversy touched not only the idea of the Church, but upon the Church's liberation from State control (see DONATISTS). While the medieval Roman Church claimed the right to dominate the State, it was rather the Byzantine principle which re-emerged in Lutheran countries at the Reforma-
tion: it was held that the State, as a Christian entity, ought to concern itself even with the defence of the faith; and the territorial principle cujus regio ejus religio held its own for a time. Once, more, however, it was Calvinism that upheld religious liberty against the usurpations of the State: witness the history of Holland, Scotland, and the United States. These countries actually carried out the idea that there was no Divine principle of the innermost heart, should in no way be constrained by the civil power—a principle which, it is true, had been strongly advocated in Reformation times by dissidents like Denk and Sebastian Franck. Even the system of Established Churches was set aside, notably in the United States. It was held that the Churches should be quite independent of the State, requiring nothing from it save legal protection: only on these conditions could the freedom of the Church as a societas fidei be realized. Certainly, were the Churches to attempt to suppress freedom, and to drag them the people to accept their formula, as in some of the countries of the Western world, it was the Church's function to safeguard the liberty of the subject, since it is of the very essence of a free Church that the members should belong to it voluntarily, and should not be coerced. The outcome of such a freedom is that the religious spirit unfolds itself in the most varied forms. State Churches, in fact, can compete in this respect with voluntary Churches only by admitting a wide variety in their doctrine and practice. Cf. art. ERASMIANISM.

(i) Bare mention may also be made of the fact that emancipation is understood by some in an absolute sense, i.e. as personal liberty without any qualification whatever. Such freedom is conceded to the man of genius, as, e.g., by Rousseau and writers like Schlegel—in his theory of Irony; or to the man of power, as in Nietzsche's Übermensch. But all this really amounts to an emancipation from morality—a condition 'beyond good and evil.' Such an emancipation, like the Solipsism of Max Stirner's Ein Individuenrecht (Leipzig, 1843), is sheer delusion.

3. Moral and religious bearings of emancipation. From the foregoing survey we see how emancipation is grasped upon the one hand, as the Church's interference in things of the State, and more, manifesting itself now as the liberation of thought, now as the deliverance of the individual from the bondage of society and of organized communities, and again as the liberation of one community from another, each exhibiting a growing sense of its peculiar function, and striving to fulfill the same in its own way. It is admitted by the various schools of thought—whether as a subject for blame or for praise—that the process of emancipation is in the last resort the supersession of authority by autonomy. In this striving after freedom many read hostility to religion, a tendency to break away from the Divine government, the atomizing and leveling processes of Babylonian and Cynic life; but, as a matter of fact, men are meant that justice is to be determined solely by the individual (who appropriates what rights he can), the imminent dissolution of discipline and order— the condition of the universe. It is, however, as to J. G. Fichte for instance, the real tenor of the process seems to consist in the transmu-
tation of authority into liberty, of natural gifts into qualities personally acquired and developed, of tradition into freedom of thought and act; in the ceaseless renovation of communities—not as dead institutions but as living organisms—by the unobstructed effort of their members; and in the growing capacity of each separate community to undertake and execute its specific work, without alien interference, but with its own resources, and according to the principles of its constitution—no community having authority over any other, but each being supreme within its own domain, and each in reality best serving the interests of the rest by attending to its own affairs.

It is a fact beyond question that the human personality must possess the moral right to express itself in action, and is, therefore, entitled to a measure of emancipation adequate thereto. Moral personality has two sides. There is first of all the universal side, in virtue of which every man ought to have an equal claim to the power of a thing and upon this postulate rest the general rights of man asserted by the advocates of Natural Law— including not merely protection of life and property, but freedom of conscience and thought and action. Then there is the individual side, which postulates that each person, as such, should possess the right to develop his special talents in his own way; nor is he to be levelled to the general average of society, as is demanded by certain schools of Socialism. It is clear, nevertheless, that an emancipation of the individual issuing in a ruthless self-assertion at the cost of others would subvert the real rights of the latter, while, as a matter of fact, men are meant to work as complementary to one another. It is, therefore, of capital importance that an adjust-
ment be made between the general rights of moral personality and the right of the individual to act. The only condition of a person being must be free to act in his proper vocation, and must at the same time pay due regard to the corresponding right of others.

The relation subsisting between the individual and the various groups—the family, the corporate body, the class, civic society, the State, the Church, custom—is conditioned by the postulate that as a moral personality he shall have the right to act spontaneously, and according to his abilities, in these several relationships, and hence also to assist
in the continuous renovation of the communities themselves; emancipation is, therefore, necessary as a means to that end. Again, however, the varying rages of the human brain and im-
tinity, must demand that recognition be given by the
individual to the constitution and order without
which they could not exist. Hence there emerges one of the peculiar religious ideas of the condi-
tion, of which is that, while the existing economy of
these communities is treated with respect, it shall
leave room for development and reform, and con-
sequently for efforts directed thereto, such progress
shaping itself in accordance to the distinctive char-
acter of the several communities.

Finally, as regards the interrelations of the various
communities, it is required that each of these
shall possess such a measure of freedom as will
enable it to develop according to its own prin-
ciples, and to do justice to its specific aim and
object. But, since none of these communities is
absolutely independent, since, in fact, they circums-
cribe one another, they must enter into mutual
relations. So far as their external activities are
concerned, the province of each must be delimited
in such a way as to obviate the possibility of collis-
on. By that the law, the guardian of which is the State,
while it is the State likewise which must guarantee
the complete liberty required by each community in
the sphere of its historical function.

In a word, emancipation is a necessary moment
in that liberation of the moral personality and the
moral community without which they cannot ade-
quately realize their appropriate moral end. But
this fact also indicates the limitation of the process,
viz., that the individual and the community alike
must regard themselves as each having a place in the
whole moral organism, and as working towards the
Highest Good, or—in terms of religion—the
Kingdom of God. Emancipation taken as an end-
in-itself, and as the repudiation of moral respon-
sibility, is worse than useless, and results in moral
chaos; but, if we regard it as a means of setting
the moral powers free for action, so that they may
most efficiently contribute their special quota to
the realization of the whole ethical process, then
emancipation is seen to be a demand of the moral
world itself.

EMERSON.—I. Life and writings.—Ralph
Waldo Emerson, the most
famous representative of the Transcendentalist
school of thought in New England, was
born, the third of seven children, in Boston, Mass., on 25th
May 1803. His father, William Emerson, was

minister of the First Church (Unitarian) in Boston;
his mother, Ruth Haskins, was a woman of strong
and gracious character. Emerson took a genuine
pride in his descent from famous New England
ministers. It gave him ‘a certain normal piety,
levitation education’; he counted himself happy
in having a star which rained on him influences of
the most eminent type. However, Mary Moody Emer-
son, did much to shape his character and thought
—the kind aunt whose cares instructed my youth,
and whom may God reward!'

He was educated at the Boston Grammar School
and Latin School, and then at Harvard, where he
graduated without any great distinction in 1821,
two of his brothers proving much more brilliant
than he. The family circumstances being strait-
then, the amount of time he had to study was
limited to two hours a day. He was influenced
by American and Continental teachers, and
found the most stimulating stimulus in the
philosophies of the 18th century. He was
inspired by the study of Schelling's works, and
the influence of the later American and
European philosophers.

Finally, he was attracted by the philosophy of
the 18th century, and the influence of
Schelling's works, and the great
philosophers of the 18th century.

The clearest light on these earlier years, and
indeed one of the most valuable means we possess
for the knowledge of the essential Emerson, has

279
recently been given in the long-delayed publication of his private journal, edited by his son and grandson. Four volumes have, so far, been issued, covering the years 1829-38. Early in life he began a notebook system, one chief purpose of which was to keep a diary of his condition and deliver him from 'cheap, extemporaneous, draggletail dogmatics.' He included quotations which had impressed him; his own comments on these and similar aspects of the current literature. The book, which he read to, by him and to, especially from his correspondence with his aunt Mary; and all the spontaneous overflow of his mind according to the outlook and feeling of the moment. It was, in part, a deliberate literary exercise as well as a storehouse of memories and seed-thoughts, as when he took a fancy to imitate for a time the _Rambler or Spectator._ This Journal was the foundation of his published writings, and contains the rough-hewn outlines of some of his most famous utterances. The whole is of the most intense interest as a revelation of the man. The lover of Nature is here continually— and the indomitable optimist, except at a certain year, 1849—true to his health and depression. Here are the gravity and dignity that gave to so many of his later utterances an oracular and prophetic tone: 'Why has my mother diary no jokes? Because it is the Diary of a Philosopher. [This,] one man is great alone.' Here are hints of the remoteness and reserve which were characteristic to the end: 'Aristocracy is a good sign . . . no man would consent to live in society if he was obliged to admit everybody to his house that chose to come.' Here is his own confession of the wayward and disconnected thinking which some of his critics have regarded as his chief defect: 'My wayward Imagination have beside the close of the sheets which I dedicated to the Genius of America, and notice that I have devoted nothing in my book to any peculiar topics which concern my country.' Here may be traced the beginning of the Swedenborg influence, which left so deep a mark upon him, especially in its feeling for the unity of Nature and its foreshadowing of the idea of Evolution: it reached him first through a 44-page pamphlet, entitled _The Growth of Mind_ (Boston, 1826), by Sampson Reed, a young apothecary. The pamphlet does not contain much that would now arrest attention, but to Emerson it had the 'aspect of a revelation.' But the most interesting ingredient in the book is the youthful outlines of the doctrines of which, in later years, he was to be the prophet. The _Essay on Compensation_ is here in germ. When he was 22 he wrote:

1. "I say that sin is ignorance, that the thief steals from himself, that he who practices fraud is himself the dupe of the fraud he practices; that whose bowews runs in his own debt, and whose givens to another benefits himself to the same amount."

The doctrine of self-reliance is equally prominent: cf. this (at 20): "I see no reason why I should bow my head to man, or cringe in my demeanour. This, again, in a letter to his aunt, anticipates his frequent championship of the individual soul, its rights and dignities:

1. "I believe, in my old faith, that to each soul is a solitary law, a several universe. The colours in our eyes may be different,—your red may be my green. My innocence to one of more importance than guilt to you."

So we watch in these volumes the gradual unfolding of the thinker and the man. At 17 he dreams of standing 'in the fair assembly of the chosen, the learned and the beautiful'; at 20 he writes: 'I burn after the _aliquip immensus insignia philosoplique_ which Cicer did desire.' And, as we turn these pages, we feel that he is already far upon the way.

By the time of his settling in Concord his life ran a contrary easy and edifying course, and

1. There is a passage to the same effect written when he was 19. Cf. the opening of the Essay itself: 'Ever since I was a boy . . .'

280

EMERSON

without its financial struggles and its private sorrows, such as the death of his eldest boy in 1842 (commemorated in _Thermopylae._) His second visit to Europe was in 1847, when the lectures on _Representative Men_ were delivered, and his third in 1872.

'The rest is silence.' But his correspondence, notably with Carlyle; his reception of innumerable visitors; his happy communion with his family and with Nature; and the publication of his _Nature,_ _Self-Reliance_, and _Nature_, published in 1836—deserves special notice because of its relation to the movement of which Emerson became the principal seer. Though the little book was greatly admired by a few, twelve years passed before 500 copies were sold. Its value lies not only in its intrinsic beauty and suggestive-ness—it contains some of the most poetic prose that Emerson ever wrote—but also in that we look back upon it now as a kind of preface to all that is covered by the word 'Transcendentalism.' It is difficult to frame this movement in any exact definition; it was more a spirit that could be felt than a set of doctrine which might be formulated. It had links of connexion with Kantian idealism; it owed much to the influence of Coleridge, Carlyle, Goethe; also to Edward Everett, who popularized in Boston the newer stirrings of European thought. But there was, in America, a current of thought, as of Europe: it was a reaction against the intellectual conventionality that reigned in Unitarian as in Calvinistic circles; it was a cry for new life, or partly a cry and partly a breath that came in to life. The movement gathered to itself supporters, some that were notable, such as Margaret Fuller, some eccentricities and extremists, many that were obscure in name but lofty and earnest in spirit.

To get the essence of the Transcendentalist spirit, one might take this sentence from _The Dial_:

'They [the Editors] have obeyed, though with great joy, the strong current of thought and feeling which, for a few years past, has led many sincere persons in New England to make new demands on literature, and to reproduce that rigor of our conventions of religion and education which is turning us to stone, which renounces hope, which looks only backward, which asks only such a future as the past, which unsuspects improvement, and holds nothing so much in horror as new views and the dreams of youth. To most of us makes the conductors of the present journal have nothing to do.'

The same spirit is more briefly and positively expressed in the first paragraph of _Nature_:

'The foremost considerations beholding God and Nature face to face; we, through their eyes. Why should not we also enjoy an original relation . . .?'

It is obvious that this relates itself closely to Emerson's favorite gospel of self-reliance: the Transcendentalist is one who trusts the deepest voices of his own being, and holds himself gladly free to follow the new light that new days bring to him. Yet he, of all men, is most truly loyal to the past; he is but doing what great souls of all ages have done before him.

'This way of thinking, falling on Roman times, made Stoic philosophers . . . falling on superstitious times, made prophets and apostles . . . and, falling on Unitarian and commercial times, makes the peculiar shades of idealism which we know.'

This sentence from the lecture on _The Transcendentalist_ hints at the way in which Emersoniansan called for reverence for the past with his still greater reverence for the intuitions and revelations of the living present.

_Nature_ was followed by two public utterances, which were both significant and prophetic. The oration on _The American Scholar_ was delivered at Cambridge in 1837—an event, Lowell says, 'without parallel in our literary annals. It has been described as the birth of intellectual declaration on the part of America;' it was a call to the sluggard

1. 'A sentence in the _Journal_, when he was 18: 'Greatness is a proper thing in the proper course, and it must be possessed long before it is acknowledged.'

2. Cf. Emerson, in _The Dial_, April 1843: 'The American Academy, the Historical Society, and Harvard University
intellect of the American continent to look for and is looking for.

'We have listened too long to the crooked noses of Europe; . . . we will walk on our own feet; we will work with our own hands; we will speak our own minds.

The influence of this address in calling forth an American literary consciousness can scarcely be over-estimated; the mind of a nation challenged itself through the voice of a man; the younger thinkers of the time heard it as a call to courage and to self-reliance; and self-reliance is the watchword of the hour in Daniel (10th) repeated for modern ears. This was followed the next year by the Address to the Divinity Class in Cambridge—an utterance which was met with much controversy, in which Emerson took no part. Its significance for us lies in its revelation of his religious position. It was the doctrine of self-reliance applied to the loftiest things—a re-assertion of the great Stoic doctrine, 'Obey thyself'; a prescription: 'first soul, and second soul, and evermore soul,' for the deadness of conventional thoughts and forms; a call to rise to Christ's conception of the greatness of a man. This all shocked the public box by seeming to belittle the historic basis of Christianity and the accumulated witness of the past; it alarmed some who did not count themselves specially orthodox, by its sheer courage and self-reliance upon immense and mysterious matters. Things here are characteristic, and the reader who knows this utterance well knows much that came after.

There is the deep and passionate moral sense, which to Emerson was the very nerve of religion; when a man attains to say, 'Virtue, I am thine, save me, use me . . . then is the end of creation answered and God is well pleased.' There is a glimpse of his critical and independent relation to historical Christianity,—his feeling that he has hold of something larger than the Churches were giving,—his conviction that the best method of honouring Jesus was to show the same courage as He showed and to live as He did, by intuition and conscience, and faith in the grandeur of the soul. There is also a note which may almost be called Messianic: 'I look for the new Teacher, that shall follow so far those shining laws, that he shall see them come full circle.'

But Emerson's religious position as a whole is best summarized in a phrase from one of his letters to his aunt Mary: 'I belong to the transcendentalists; and a little of their vision to all the dogmas is in one sentence in his Journal (1830): 'Alii disponent, ego manorab, said Augustine; it shall be my speech to the Calvinist and the Unitarian; I have let women and men, and the bright boys and girls in New England, when in 1842 he wrote to Carlyle: They are all religious, but they hate the Churches. It is evident from the Address and from other utterances that the historical element in Christianity never appealed much to him: 'We shall look back, peradventure, to Christianity as to a roastery on which, in the morn of existence, we learned to erect our prayers.' It was this which enabled him to delight in Swedenborgian interpretations of Scripture, which were utterly inaccurate and unhistorical; it was enough for him that the sentiment was true and eternal. Apparently, however, even he was sometimes afraid lest the world would do well to make the Concord smelters the subject of examination in regard to their literary and ethical influence.

For he was a man who travelled to Europe, with the aim of a European taste. Our education, so-called—our drifting at college and our drifting since—has been European, and we write on the English culture and to an English public, in America and in Europe.'

See, in this, art, by W. Robertson Nicoll, mentioned under Literature. Cf. the passage at the end of 'Worship' (Conduct of Life) where the new church, to be founded on moral science, 'at first cold and naked, a babe in a manger again.'

EMERSON 281

It is not good to say with too much precision and emphasis that we are encroached upon by the chains of Jesus in the current theology, and let us carry these things up into a collier state of mind.'

That state of mind was never Emerson's own. His positive assertions were always so essentially religious and believing that they have lent wings to many who have small sympathy with the more negative side of his position.

Emerson's writings include the following: in 1841, Essays (including 'History,' 'Self-Reliance,' 'Compensation,' 'Spiritual Websites' by his friend), followed by 'Character,' 'Manseers,' 'Nominalist and Realist,' 'New England Reformers, etc.); in 1848, Miscellaneous (including 'Nature."

The American Scholar," the 'Address to the Divinity Class,' 'Man the Reformer,' 'The Times,' 'The Conservative,' 'The Transcendentalist,' etc.), and in the same year Representative Men. In 1851 he united with W. H. Channing and J. F. Clarke in the Memoirs of Margaret Fuller Ossoli. In 1856, English Traits appeared; in 1850, Conduct of Life; in 1870, Society and Solitude; in 1875, Letters and Social Aims; in 1875, Fortunes of the Republic. His first volume of Poems was published in 1847; May-day and other Pieces appeared in 1877; Selected Poems in 1876. After his death the following appeared: in 1884, Poems (new and revised edition), another volume of Miscellaneous, and British and European Sketches; in 1896, The Natural History of Intuition, and other papers. In 1905, the re-issue of the Complete Works began in the Centenary edition, and in 1900-1901 the first four vols. of the Journal were published.

Emerson died at Concord, where his peaceful home had been for nearly half a century, on 27th April 1882.

2. Characteristics.—Emerson's works are a collection of miscellaneous counsels and oracles, and not the logical working out of any system of thought. But a few things stand out visibly through the whole.

(a) One is his immense and inexhaustible value as an ethical teacher. His ethical-religious position is different from his own in the ethical realm a vast debt of gratitude—not least for his gospel of self-reliance, his insistence on the duty of self-respect and the obligation to listen to the imperial voice of one's own soul. Linked with this there is his deep sense of the worth of the individual.

'God enters by a private door into every individual . . . Everybody knows as much as the saint. The walls of rule minds are scarred over with facts, with thoughts. They shall one day bring a lantern and read the inscription.'

If this emphasis on self-trust has its dangers, Emerson guardedly against them in the following maxim of responsibility and of the greatness of life; he shows us in prose and poetry the scorn that is in the eyes of the passing days if we do not make good use of our gifts:

'Truly it demands and requires that we shall know on the common motives of humanity and that humanity has ventured to trust himself for a taskmaster' (Self-Reliance).

Two qualities make him an ethical teacher most bracing and helpful to the young. One is his note of good cheer—his sense of the ethical value of hope. Here comes in the doctrine of compensation; his sense of the utility of scepticism; his vision of the glory of living in the present age.

'rejoice that I live when the world is so old. There is the same difference between life and death, as between me as in going into a new house, unfinished, damp, and empty, and going into a long-occupied house where the time and taste of its inhabitants has accumulated in instructions, contrivances, has furnished the chambers, stocked the cellars, and filled the library. Are the lovers of the past, judge between my houses! I would not be elsewhere than I am' (Journal, ii. 71).

The other is his general manliness and closeness to life, his insistence on concentration, on thoroughness, on discipline; this is even clearer in the later writings, where there is perhaps less mysticism and more guidance for the highway—his head is

1 Cf. The Prodigal Son, the poem in which after his praise of the 'Shakespeare of the Divines,' he concludes; 'And yet, for all this faith could see, I would not the good bishop be.'
loss in the clouds and his feet are more upon the earth. He can be very searching, this sage of the highway:

A day is a more magnificent cloth than any muslin; the mechanism that makes it is infinitely cunning: and you shall not conceal the sleazy, fraudulent, rotten hours you have slipped into the piece, nor fear that any honest thread, or straight line of steel, or more inflexible shaft, will not testify in the web' (Poems).

(b) Along with this ethic there goes a something that is not quite a theology; let us call it an almost theology—a garment that is not fashioned according to any existing star-man, but is real enough to provide a sky for the earth and a dew for the tender grass. The typical piece here is the Oversoul. Why should I so boldly trust my intuitions? Because intuition is reception: one can part of our business in this world in receiving. Emerson had been a critic of the accepted theologies from his youth up:

'It seemed to me when very young that on this subject (Christian) life was ahead of theology, and the people knew more than the preachers taught.'

The critic in his turn has often been criticized for his theological indifferentism and for his leanings towards Pantheism. Yet, if he leaves God vague and undefined, readers of different standpoint can read their own beliefs into his large conceptions; and his great help is from his essentially religious spirit. 'I shall not call God the Beautiful, who daily showeth Himself so to me in His gifts? That is almost enough theological definition for him. If a Christian preacher were turning Emerson's language, his search of his propositions in Scripture texts, there are two texts that would draw to themselves a special number of thoughts and phrases. One is St. Paul's counsel, 'Let each man be fully armed with his own mind' (Ro 14); the other is the Psalmist's prayer, 'Let the beauty of the Lord our God be upon us' (Ps 90)'. Here at least is much to live by—aglory in the heavens and a firm path upon the earth. In regard to the doctrine of immortality, he was also lacking in definition, though he was optimistic throughout. Sometimes he spoke vaguely and impersonally, sometimes more warmly and in terms of a personal hope.

'All the comfort I have found teaches me to confide that I shall not have less to times and places that I do not yet know.'

In his later years he is said to have spoken sometimes of reunion with those who had gone on before.

(c) Through all the writings there appears most vividly the man. The very limitations and defects of the thinker, which are plain enough, are the limitations of the man. He had not the gift of ordered and consecutive thinking; he wrote once to a friend:

'I do not know what arguments are in reference to any expression of a thought. I delight in telling what I think; but if you ask me how I dare say so, or why it is so, I am the most helpless of mortal men.'

A good deal of criticism is disarmed by this frank confession. Beside his avoidance of life's more tragic and terrible themes in his teaching, there may be placed the fact that in common life he hated to hear people speak of their ailments. Some may regard this as a virtue and others as a defect; but most people who speak of their distempers weaken themselves by doing so; and he may have deliberately chosen in his writings to leave the shadows to others and to point the sunlit path where men could have the maximum of courage and strength. There are indications in the earlier pages of the Journals that he was by nature means without a sense of personal sin, especially at the time when his life was first enriched by love, and humbled by his call to the ministry. Did he outgrow these feelings as if they were the soul's murmurs and musings and whooping-coughs?

One thing is sure, that, even if he left behind the shadow of sin, he did not leave behind the shadow of sorrow; and his journals give hints of a life not all complacency, with veiled depths of brooding and pain. But through it all there breathes the spirit of a truly lofty character—the man who is more than all his words. His later years were surrounded by a reverence such as is given to few men while they are still alive. Lowell wrote in 1868:

'For us the whole life of the man is distilled in the clear drop of every sentence, and behind each word we divine the force of his noble character, the weight of a large capital of thinking and being.'

Even to those who are much further removed, that force and weight still make themselves felt; to few writers are they bound by so strong a tie of personal admiration.

3. Poetical genius.—Widely different estimates have been made of Emerson's worth as a poet. Some tell us that here is the Emerson who counts, and that all else is nothing by comparison; others again are offended by his comparative lack of form and music, and deal with his poetry in the somewhat cold-sounding and ungracious fashion adopted by Matthew Arnold. Appreciation will always vary according to the value placed by the critic upon melody or upon thought; some will despise the ship because she labours in making progress; others will prize her for her useful weighty freight she bears. Emerson's description of one of the Persian poets who influenced him so greatly might be applied to himself—'a river which makes its own shores'; when the river is doing that, it may break through the ordinary channels of expression, and cut across the conventional and ordered beauties of the lyric landscape; but he who has eyes for force and fullness will find something here to study and admire. Yet even the critic who seeks form and melody might find something to harp his heart in the slow undulations of the poem beginning—

'I heard or seemed to hear the rolling Sea
Say, Pilgrim, why so late and slow to come?'

... or in the severe dignity of Days and Terminus, or in the tenderness of Ternodey, or in the lyric simplicity of Thine eyes still shined, and If my darling should depart. Lord Byron's estimate is just:

'Taken as a whole, Emerson's poetry is of that kind which springs, not from excitement of passion or feeling, but from an intellectual demand for intense and unabashed expression. It will, therefore, have its appeal to a limited number. The Muse is here who

*ransacks mines and lodges
And quarries every rock
To bow the famous adiant
For each eternal block';

... and, though there is at least a little of the kindred Muse who

*a says her bea in Music,
In music every one,
To the cadence of the whirling world
Which dance round the sun,'

the impression left on the whole is one of grave severity which will always find a fit audience, though never a large one.'

4. Influence.—Few writers of the 19th, or indeed of any century, have exerted a wider influence than Emerson. 'A strain as new and moving and unforgettable as Nietzsche or Carlyle'—so M. Arnold describes the impression made in England when Emerson's message first began to sound across the sea. That influence has grown steadily. He has left his mark on many notable lives of varying type; it would be easy to gather testimonies from many biographies (e.g. those of Tennyson, R. W. Dale, Henry Drummond) where this indebtedness is confessed. And, though there are some who feel that he did not do complete justice to certain great happenings of long
EMOTIONS

ago which are still 'towering o'er the wrecks of time,' they will join with others in their gratitude for an influenced life.  and the works which are most accessible to the natural impulses and the me.  The wise belong to the good side of humanity, and hence to the benefactors of the world.  They are, therefore, not to be suppressed, but to be kept within proper bounds.  In this way he distinguishes between agency (sub-human growth) and virtue.  The good man is not self-denial, in which the desires, not yet overcomen and still active, are being resist.  while true self-destruction is found in the 'man,' in which the desires are reduced to due propor.  tions, and thereby brought under the sway of reason.  Thus, according to Aristotle, some of the evils which we meet in the soul, which give rise to pleasure or pain—cowardliness, anger, fear, love—are nothing else than when they feel they are not yet at the same time to be restrained without reason.

LITERATURE.  The Journal alluded to above, vols. 1909-10; the authori Life by J. E. Cabot, Boston, 1887; the mono.  tography of Carlyle and Emerson, 1884- 1872, ed. C. E. Norton, Boston, 1885; Correspondences of Carlyle and Emerson, 1868- 1870.  These are all accessible to the philosophy of the whole body, or to the 'common-places,' in which Plato's estimate of the emotions varies according to the intellectualism.  to the emotions in Ethics will vary according to our view of the foundations of morality.

I. HISTORICAL SKETCH.  The emotions in Greek ethics.  Plato enumerates three faculties of the soul, viz., the appetitive (ἐνέργεια), the impulsive or spirited (ἐνέργεια), and the rational (νοηματική), each having its appropriate virtue; and these three re-appear in the State (which is but a magnified personality) as the several ranks of artisans, warriors, and philosophers.  This view gives due recognition to the emotions, since each faculty has its own virtue, and the harmony of all is justice, defined as ἀρετή ἀριστον ("each doing its part.").  In the theory of goods, which does not exclude pleasure, Plato aims at the harmony of all the faculties, declin.  ing to the idea of the whole life is an appetitive faculty.  Plato's estimate of the emotions varies according to the intellectualism.  The change.  In the State, the common.  Plato's concern for the realization of such a harmony is seen in his theory of education, which states, "The life is to be educated to the task of keeping desire in leash; and, as it may be required, to be restrained without reason.

(0) In this negative aim the Epicureans are at one with the Stoics.  The noblest mode of life is that which is purely to apathy.  They set the emotions at the heart of individual morality; in fact, their cosmopolitanism is no more than an ideal.  Their morality is simply the absence of evil.  The Stoic wise man is one who is free from all sorrow, engaged in purely rational activity, and is not the least afraid of the world, over, a man must either be entirely wise, or else a fool.  The passions consist in a natural desire to commit such acts as spring from suffering, to fulfill other things, for, under passion, everything is judged from a transient and limited point of view, and is to be restrained without reason.

(0) Still greater influence is assigned to the emotions by Aristotle.  For him, as for Plato, the highest virtue consists in knowledge, which in its perfection is Divine; but he different.  and, in fact, the passionate soul is in a way a slave, so to speak, to the passions.

1872, 1871, the Century ed., Boston and New York, 1868, etc.; also in England, 8 vols. ed. Morley (1855).

J. M. E. ROSS.

EMOTIONS.  The present article will deal with the emotions in their ethical bearings, i.e. considered as springs of moral action.  For the more strictly psychological and physiological, the reader is referred to the corresponding essay in the article on Human Nature.  The emotion may be regarded as a compound of feeling and impulse.  It belongs to the natural constitution of man, and is distinguished from both intelligence and morality.  The theory of the emotions in Ethics will vary according to our view of the foundations of morality.

(0) This characteristic attitude to knowledge is adopted also in the later Greek systems, viz., Stoicism and Epicureanism.  (a) The Epicureans aim at the pleasure of life, base it on the desire for pleasure, and maintain that the human being is completely overthrown from the apathy of the Stoics.  It is remarkable that, while, after the age of Plato, Art tends to become more emotion- al, philosophy seeks salvation in freeing itself from the apathy. Though Epicurus rejects personal pleasure, he is still concerned with pleasure of a kind, namely, that which lasts beyond the momentary thrill.  Since, however, the goods which yield pleasure are liable to change, he lays great emphasis upon the feeling of security, which is partly supplied, and indeed guaranteed, by the State; and also upon the ataraxia which can be maintained at the face of death itself.  Epicurus desires to eliminate the transient factor in the emotions, to guard against both pain and fear, to cost the passions as being the source of suffering.  In the theory of goods, which does not exclude pleasure, Plato aims at the harmony of all the faculties, declining to the idea of the whole life is an appetitive faculty.  Plato's estimate of the emotions varies according to the intellectualism.  The change.  In the State, the common.  Plato's concern for the realization of such a harmony is seen in his theory of education, which states, "The life is to be educated to the task of keeping desire in leash; and, as it may be required, to be restrained without reason.

(0) In this negative aim the Epicureans are at one with the Stoics.  The noblest mode of life is that which is purely to apathy.  They set the emotions at the heart of individual morality; in fact, their cosmopolitanism is no more than an ideal.  Their morality is simply the absence of evil.  The Stoic wise man is one who is free from all sorrow, engaged in purely rational activity, and is not the least afraid of the world, over, a man must either be entirely wise, or else a fool.  The passions consist in a natural desire to commit such acts as spring from suffering, to fulfill other things, for, under passion, everything is judged from a transient and limited point of view, and is to be restrained without reason.

(0) Still greater influence is assigned to the emotions by Aristotle.  For him, as for Plato, the highest virtue consists in knowledge, which in its perfection is Divine; but he different.  and, in fact, the passionate soul is in a way a slave, so to speak, to the passions.

1872, 1871, the Century ed., Boston and New York, 1868, etc.; also in England, 8 vols. ed. Morley (1855).

J. M. E. ROSS.
EMOTIONS

upon suffering, but it is rather the agreeable sensation that accompanies freedom and energy, while even the pleasure yielded by the"souls without a aura," the sun of which is unwarranted, being a kind of suffering. It is true that the Stoics did not carry their view of the exclusive value of virtue, any more than they allowed any value of apathy, their"vulgar" view, if they are allowed to exist, will always be just what it is supposed to be. But it is certain that minor objects of human desire, such as health, riches, friendship, etc.; and, though happiness does not depend upon them, there is none that is so precious in possessing them; hence the doctrine of apathy cannot be fully carried out. Nevertheless, the Stoics held that the man who will not become the slave of such things. In reality, virtue is sufficient for happiness, and, though the wise man may suffer in the exercise of his duties, the feelings of pain and sorrow, he can rise above them. Like the Epicureans, the Stoics stand at the culmination of Greek thought; they withdrew from the external world to the internal, and find the "life according to nature" in that life alone which is in harmony at once with the laws of nature and with that of reason. They set a high value upon self-preservation—an end which, being in full accord with perfect freedom, manifests itself in indifference to painful experiences, and the wise man to evade his ownness with the supreme, all-pervading Deity.

The main trend of Greek ethics is towards the supremacy of reason, and, while in Plato and Aristotle reason appears as the harmonizing principle that controls emotion, it is for the Stoics and Epicureans the sole principle, since all natural ends, indeed, as moral sin—no, however, and a mood of pessimism dominates everything.

There had been, as the Stoics believed, few wise men in the past, and a multitude of fools. They held that men are wholly free from all painful experiences whatsoever—in a word, from the  

Thus, wherever knowledge is regarded as the formative ethical force, and the will is associated with the process of judgment, the emotions can have no proper place. Emotions are blind, in fact, must be assigned finally, as in the Stoа, to defective understanding.

2. In Jewish and Early Christian ethics.—The emotions perform a very different function in a sphere where morality is an affair of the will, as, e.g., in Judaism. In Jewish ethics the will is determined by the emotions of fear and hope—fear of punishment and hope of reward. The commandments as given by God were definite and, in fact, must be knowledge of the Good as something in itself valuable, but only fear and hope. It is true that trust in God and love to God had also a place in Judaism; but it was a subordinate one, and they were regarded as the end by the other.

The emotions had a recognized place also in the primitive Christian ethic, and have retained this in sundry forms till the present day. Despite the asceticism and need in the strain interminably heard in the NT ethic, the emotions fill an important rôle.

For one thing, love is looked upon as the supreme ethical motive: love, as an amalgamation of feeling with a definite and permanent direction of the will, is the emotion which in Christianity is exalted to the grand creative affection of the soul. Love to God is the standing motive of the moral and religious life. The natural impulses and feelings are, however, because they are intrinsically corrupt, but because they have assumed the command and taken the wrong way. Self-seeking love of the world have "agapе," love of God. Emotion, accordingly, is not to be eradicated, but simply turned to its proper use, and this is achieved when it becomes the support and inspiration of good volition. But such volition is directed towards God, and to God and God's love toward it. No conception of God, while, on His part, God is the Father of all. Thus, according to the Fourth Gospel, the Christian is fulfilled with an enduring power that cannot be taken away. His bestowing emotion is a permanent and blessed spirit of love, which predisposes him to good works. Fear of punishment and hope of reward may still remain—vestiges of Jewish ethics,—but perfect love drives out fear. Nevertheless, the pre-emience of love in primitive Christianity does not exclude the suppression of other emotions; they, too, are to be made auxiliaries of the spiritual life. St. Paul is a man of singularly fervid emotion—one in whom even anger is subordinated to the service of the divine. Yet, although, inter alia, the expectation of the Parousia was a specially potent factor in causing men to set less store than they now do by such earthly boons as marriage, social position, property, art, etc., and to repress the natural feelings that cluster around these things, yet, as a compensation, the peculiar heritage of the individual was placed upon a new basis, inasmuch as every man had a vocation of infinite value, and every condition of life could be consecrated by the operation of a right spirit within. Here, then, provision was made for a deepening of spirit and a refinement of feeling such as are possible only where so high an estimate is placed upon personality.

In its further development, Christian morality presently shows a tendency to coalesce with Greek ideas, at least on the native soil of the latter, in the "Element of Altrmit of All." The Stoics and Epicureans coalesce with the Christian principle of love. Along with the distinction between gnosis and phйl, between the ecstatic, intellectual religion of the mystics and the popular, the Stoics held that the Christian Gnostic must be an érкtос ийккрко (defined as a member of the Church, i.e., delivered from sin), i.e., delivered from the wrath which originate in the distinctions of sense. He must rise to the sphere of calm, clear knowledge; and, while not declining the moral struggle of life, he must be independent of them. Nevertheless, he does not show himself sympathetic towards his fellow-man; he, too, has to bear his besetting of gnosis does not repudiate his relations with the natural, and his apathy is toned down to something not unlike the Platonic.

In the West, the challenge of Christianity to the older civilization is much more emphatic. True, we find tertullian speaking of the anima naturaliter Christianа; nevertheless, his ethical teaching—particularly in his Montanistic period—is hostile to all culture, and is directed towards the complete exclusion of desire, so that he might almost be called a Christian Cynic. Personally, however, he is highly emotional and passionate, and, especially as a Montanist, prone to let himself be carried away—even to the point of ecstasy—by feelings commonly thought to be symptomatic of inspiration. As a protest against the moral degeneracy of his age, he demands that Christians shall withdraw themselves from the public life of heathendom, which fosters the passions the Christian must eschew. Theatrical performances and second marriages are special perils. Tertullian advocates a complete severance of discipline, and revives the opposition to all athercistic culture of one's natural passions. He aims, not at the breaking away from the complete exclusion of all that culture bestows, even the culture of the emotions. Hence, too, the impassioned character of his remonstrations against the heathen world, which centres itself upon moral reform of a Chnstian, i.e., first of all, an anti-page, a white hand. In the white hand, he finds the complete conformity to nature," which he regards as also in line with Christianity, appears to him to consist in perfect simplicity of life, in the repression of cupidin и conscientia. pagan civilization has fanned the flames of passion and desire, and has taken man away from his natural and simple conditions. As this antagonism to heathen culture develops, however, it eventually becomes an antagonism to all that is natural, which is declared to be corrupt. Ambrose desiderates a complete independence of earthly joy and sorrow: "non in passione esse sed victorem passionis esse beatum est." Property is grounded in selfishness: "peculiа continentur est instituta forma." Our possessions are to be placed at the disposal of love by works of beneficence. Augustine knows only of a human nature that is entirely corrupted with original sin—a massa perditiом. With him, emotion has an everlasting standing in relation to all the loveliness of God, which at its highest he combines with the eschatological anticipation of future reward and the fear of future punishment.

3. In monastic and medieval ethics.—Monasticism rejects all earthly goods—as a condition of entire consecration to the love of God. Since the natural is here regarded as wholly alien to the Divine, or at least not needed, since we have a complete departure from the natural propensities and feelings die away in love to God. Morality being in itself inadequate, all the more decisively is emotion transferred to the sphere of religion; it was in the Middle Ages that the idea of emotion was given its complete and absolute character. The West allows a much greater scope to the emotional element in that sphere than does that of the East,
just because the West lays the main emphasis upon a will wholly surrendered to God, and the East upon free will. Even the ecstatic love of God spoken of by Dionysius the Areopagite is much less emotional than the Divine favor of many a medieval mystic, and the subjective factor comes far more to the fore than in the Idea, though this is not to say that, on the contrary, the enjoyment with Plato, and the purgative life, or is less intense. But in the case of the virtue of love, the exuberant bliss of Divine intercourse, is emphasized. According to Plato, it was a blessed thing to gaze upon the Idea; but Augustine and the mystics of the Middle Ages took the emotions as the end in itself, which is reason for God and brings beatitude to man. But while religious emotion thus threatens to absorb every other concern of life—just as the fervent zeal of the Church counted earthly interests as nothing in comparison with religious interests, and so sent the heretic to the stake—yet medieval morality is not without a mundane aspect, as appears in the ethics of Aquinas.

Abelard, indeed, lays all emphasis upon the disposition, but he sees in Christianity the assertion of that law of nature which was recognized and obeyed by the philosophers of old. The good is to be willed for its own sake; hence penitence must be something more than external works, and must have, to be a true penitence, for its subject a theological one. Abelard accepts the ancient cardinal virtues; in short, he delivers them to the Church, and sets up an antithesis between natural and Christian morality, and so he traces all the virtues to their one source in character—to love—while he also regards sin as having its cause in love. Abelard points out that love must spring from love. But this deriving of morality from love does not involve a contradiction between love and human nature, for he gives no recognition to original sin.

We find a different estimate of natural morality and the emotions in Aquinas; with him, indeed, gratia infusa and love are supernatural gifts of the Spirit; still, he accepts the cardinal, as well as the theological, virtues; and, since in his doctrine of goods he is ready to do justice to the State (though ultimately subordinating it to the Church), he discerns various stages in the development of virtues themselves. Nevertheless, even the highest of these stages only serves to accentuate his antagonism to the natural. The cardinal virtues are recuperative in God; the lowest grade is political virtue; and, as it is the duty of man to turn to God, so far as in him lies, there are, besides the temperaments and the passions, intermediate ones, viz., the purgatorio and those of the purpuras animus. Whereas the political stage is bound up with earthly things, and chastens the natural emotions, the purgatorio work negatively towards making man like God, so that, e.g., temperanta relinquishes earthly things, so far as nature permits; while, again, tempontas is the level of the purpuras animus. Aquinas's doctrine of the several grades of virtue amounts, then, to this: the political virtues are genuine virtues; the higher species curb desire and feeling as far as is possible; the lowest grade is the highest of all, but with them entire. Nevertheless, he still thinks in terms of dualism, for, according to Aquinas, the temperance consists in following nature in the world: 'Nutrimentum caritatis immutabilis capitulit.' Thus, on the one hand, the natural virtues, even in the political stage, are not virtues at all, and the natural and supernatural passions, and the nature as such, so far as they concern us, are due to love to God in contradistinction to all that is of the world, and the cardinal virtues are merged in the grace that is poured from above.

Not only, however, was it impossible in medieval ethics to suppress the affections, or deny their claims on a lower stage of virtue; they were actually made subservient to religion and the Church. A super-natural love to God, ammulling every earth-born affection, was, of course, the ideal; but, when this ideal failed the Church in its capacity of teacher, she fell to fear, meaning the transgressor with penalty—in hell or purgatory or the present world—and so engendering a spirit so not much of hostility to evil as of mere abject terror. Such emotions as love, fear, hope and repentance in the ecclesiastical sense, operated with tremendous power in the Middle Ages, while the actual moral practice of life was but little regarded.

4. In modern ethics.—In the modern period developed subjective individualism into its own, so that morality is now based entirely upon it. Philosophical ethics has at length cast off the trammels of theology, and we may distinguish three tendencies, viz., Rationalistic, which in sundry forms bases morality upon human reason, and is thus akin to the classical view; the Synthetic, which would find its foundation in impulse and feeling; and the Synthetic, which aims at combining the other two. Alongside of these has existed since the Reformations of theology, in both a Protestant and a Roman Catholic sense, the enjoyment with the Church, the exuberant bliss of Divine intercourse, is emphasized. According to Plato, it was a blessed thing to gaze upon the Idea; but Augustine and the mystics of the Middle Ages took the emotions as the end in itself, which is reason for God and brings beatitude to man. But while religious emotion thus threatens to absorb every other concern of life—just as the fervent zeal of the Church counted earthly interests as nothing in comparison with religious interests, and so sent the heretic to the stake—yet medieval morality is not without a mundane aspect, as appears in the ethics of Aquinas.

Abelard, indeed, lays all emphasis upon the disposition, but he sees in Christianity the assertion of that law of nature which was recognized and obeyed by the philosophers of old. The good is to be willed for its own sake; hence penitence must be something more than external works, and must have, to be a true penitence, for its subject a theological one. not even yet unaniempt itself from an inner conflict—the antimony which strikingly re-appears in the most recent expositions of Protestant ethics (cf. Luthardt, Franck, H. Weiss, and others).

Of the critical ethics having freed of self from theology, finds its starting-point in the instinctive feelings themselves. This school has found its main expansion in England and France.

during had called attention to the function of hate and love in the realm of nature generally, as also to their effects upon human nature, and the influence of passion upon conduct. Thomas More, in his Utopia, had promised the highest possible degree of untrifled gratification for one and all.

deliberately placed it in the impulse of self-preservation, to which he traced the emotions, thus recognizing their function in the interests of life itself, and finding virtue in the rational perception of what is useful or injurious. The Aristotelian Oeconomio, too, had asserted that the dynamic of life was not the intelligence intellectual, but rather the soul which knows and feels, and that, the emotions being rooted in the bodily frame, morality must needs rest upon a natural science of the soul; conduct, in fact, is connected with matter, and is dependent upon the natural warth of the temperament, and the feelings arising from it. Bentham also would connect morality with nature, and insists that it is tied to the complexity of situations naturally.

It was Bacon who first tried, by the scientific method of historical and psychological induction, to derive morality from experience, who combined it with the natural impulses, with the lex salutis and lex iniuria, and maintained, and maintained that the emotions must be taken into consideration as being the stimulus of the will, which is the grand factor in morality. According to Bacon, the proper function of ethics is so to regulate the emotions as to secure their obedience to reason, that is, to the laws won from experience, which enable us to harmonize the interests of self-preservation with the interests of social life. He thus discriminates the two fundamental aspects of the self-regarding and the 'other-regarding,' which have continued to play their part in Naturalistic ethics till the present day.

Hobbes, with his 'homo homini lupus,' emphasized the impulse of self-preservation in its most extreme form, making it the rationale of the State, whose function it is to keep the self-directed impulse within bounds. The social motive, he holds, is not primordial, but springs from fear, which, begotten by the individual's desire to protect himself, and by his sense of weakness, compels him to compromise with society. The State exists for the sake of peace and security, which enable the individual to live according to nature within the limits proscribed by the law; in other words, the individual, in virtue of that security, should have all the enjoyment the State can allow. Hobbes's political and ethical theories are thus based upon the desire of self-preservation and the necessary result of the war of all against all others.

The doctrines of Hobbes form a standing element in English Utilitarianism, though the latter lays a stronger emphasis upon his idea of political liberty. Utilitarianism received its classical expression from the hands of Bentham; its cardinal principle is the greatest possible good for each and all. It bases morality on the pursuit of happiness, and its sole aim is the greatest happiness of the greatest number.
